The AEI Nuclear Magnetic Resonance Spectrometer type RS2 is an advanced equipment designed to combine the highest resolution with extreme flexibility in use. *Here are its outstanding features :*

HIGH RESOLUTION Resolution of 1 part in 10^8, i.e. a line width at half-height of 0.4 c/s at 40 Mc/s ; 0.6 c/s at 60 Mc/s etc.

ELECTROMAGNET Field continuously variable from 1,000 to 17,000 gauss. Low power dissipation and special thermal insulation ease problems of drift.

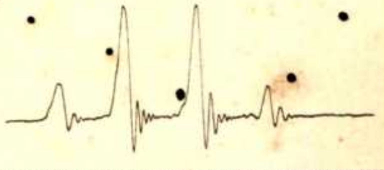
MAGNET GAP The standard gap is 1½ in. but this can readily be altered to values of ¾ in., 1 in., 1¼ in., 2 in., 2½ in., or 3 in. without changing the pole shoes. Space between coils gives easy access for probe.

R.F. SIGNAL Choice of eleven frequencies from 2.5 to 60 Mc/s combined with continuously variable magnetic field gives widest possible coverage.

PROBE Simple interchangeable inserts for variation of frequency, sample size and temperature.

Other Features: Built-in A.F. oscillator for chemical shift calibration, 10 in., and 2 in., recorders with integral design of controls to facilitate operation.

This trace shows the proton resonance spectrum of CHO group of acetaldehyde at 60 Mc/s. The separation between the peaks is 2.85 c/s and the average line width (at half-height) is 0.6 c/s approximately.



The AEI range of scientific equipment includes apparatus for ELECTRON MICROSCOPY, MASS SPECTROMETRY, RADIOGRAPHY, CRYSTALLOGRAPHY, MATERIALS IRRADIATION, HIGH VACUUM ENGINEERING, X-RAY MICRO-ANALYSIS.

Let us look into YOUR *problem.*

AEI

Instrumentation Division
Scientific Apparatus and X-Ray Department
Associated Electrical Industries Limited
TRAFFORD PARK, MANCHESTER 17

N/R 906

MOLECULAR DISTILLATION

- Suitable for materials with molecular weights up to 1200.
- Adaptable for distillation from the micron range up to 100 torr and above.
- Fully instrumented for pilot and production duties.
- Feed rates from 50–200 lbs. per hour. (Depending on material).

SIMPLE MOLECULAR DISTILLATION
Epoxy resins, plasticisers, glycerine and any material with molecular weights up to 1200.
STRIPPING
Sterols, vitamins A or E from liver oils, etc., non-condensable impurities, residual alcohols from esterification products, residual free acids from synthetic resins and plasticisers.
CONCENTRATION
Extracts and solutions
DEODORISING
Vegetable oils and plasticisers
SEPARATION
Polyglycols, complex mineral oils and mono-glycerides.

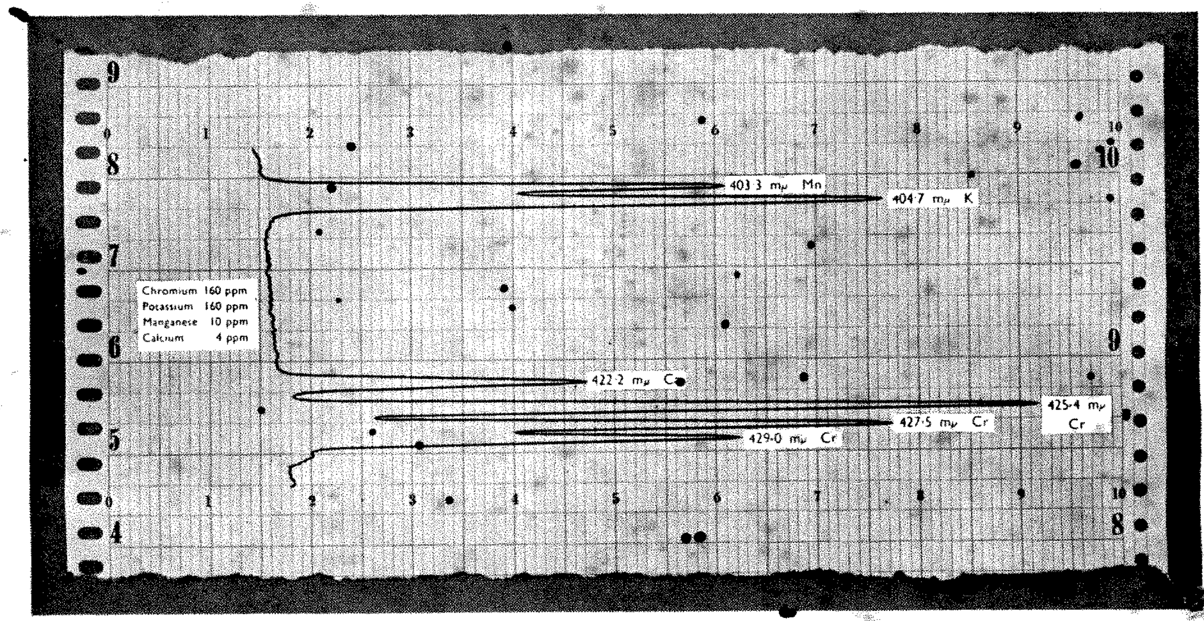
Progress with Flame Photometry



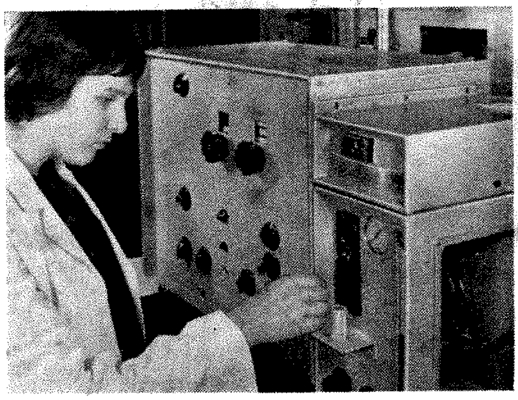
The highest standards of performance combined with speed, convenience and reliability place the Unicam SP.900 Flame Spectrophotometer in a class of its own as an analytical tool. Used as a direct-reading galvanometer instrument the SP.900 achieves new levels of ease and speed. External recorder indication adds further to the advantages of this outstanding instrument.

Elements in solution are quickly and precisely determined by the SP.900 in both trace quantities and at high concentration levels. The spectrum above illustrates the power of the SP.900 to resolve characteristic emission lines produced by different elements at narrowly separated wavelengths. Studies of complex solutions have shown that both chemical and flame interferences are reduced to a minimum and frequently can be eliminated using simple techniques.

Our Technical Sales Department will be pleased to receive details of your analytical problems and to suggest possible applications of the SP.900 Flame Spectrophotometer.

Above: Detection of four elements in one solution.

Below: The SP.900 Flame Spectrophotometer combines speed and simplicity of operation with accuracy and reliability.



A new leaflet describing the SP.900 is in preparation. Please write for a copy.

Principles of Semiconductor Device Operation

A. K. JONSCHER, PH.D.

Research Laboratories of The General Electric Co. Ltd., Wembley

This book should fill a notable gap in semiconductor literature. It sets out to deal systematically with the broad subject of injection, transport and decay of excess carriers in semiconductors. It presents the complete account of transport laws for excess carriers, a complete theory of junction diodes including current flow at high and very high densities, as well as the theory of carrier transport in inhomogeneous media. Transistor topics are discussed from the same point of view and the operation of certain new devices is presented. 30*s.* *net*

RADIOACTIVE TRACERS
IN CHEMISTRY AND INDUSTRY

Text augmented and revised by the Author

Translated by
ULLI EISNER, Ph.D., D.I.C.

This English version of Mme. Daudel's monograph—specially revised and enlarged for publication in this country—meets the need for an introductory text dealing with the chemical and industrial uses of radioactive tracers, as distinct from the biological. Aspects of the subject discussed include the preparation of radio-indicators, their use in investigating the mechanism of chemical reactions, and their special advantages in chemical analysis on a micro scale. Electrochemical and metallurgical applications, as well as control devices for industrial processes, are also considered.

212 pages. Very full bibliographies. With 30 diagrams, 9 tables, and 3 plates. 36s. net.

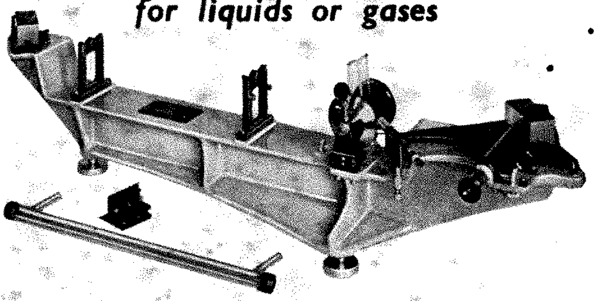
PRECISION BS INSTRUMENTS

Jamin Refractometer
for liquids or gases



Average accuracy in measurement of refractive index is approximately 0·000001 for gases and 0·000002 for liquids.
The elimination of all spring adjustment to the mirrors results in great stability and freedom from vibration. Worm wheel gearing actuates the compensator. Tubes up to 50 cm. length can be used.

Water Analysis

Water analysis is one of many problems to which the Unicam SP.900 Flame Spectrophotometer offers a powerful new approach. Effluents, boiler feeds, textile treatment, brewing and foodstuffs, dyeing—in these and many other uses of water it is necessary to know the concentration levels of a large number of inorganic elements. It is frequently found that the quickest, most sensitive method of determination is the flame spectrophotometer.

If your problem is water analysis—or any other difficulty in inorganic analysis—write now to learn how the SP.900 Flame Spectrophotometer brings new precision, new ease and speed, new levels of accuracy to existing problems and provides the answer to many new ones.

Action (Milk-ejecting), of Ergot (Prof. Ranjit Roy Chandhury and Mandakini B. Dikshit), 722
Action (Peroxidase) : Enhancement of, by Polysaccharides (Dr. B. Z. Siegel and Dr. S. M. Siegel), 391
Action (Synergetic), of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia (Dr. E Fischer, J. L. J Szabó and M. Stamburgo), 893
Action Potentials in Active Tissue with Delayed Potassium Permeability (Dr. E. P. George), 889
Action Potentials (Extracellular Unit), from the Central Nervous System : 'Weightless' Micro-electrodes for Recording (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Active Nitrogen : Reaction of, with Polyethylene (Dr. J. L. Weininger), 546
Active Steroids (Hormonally) : A New Class of (Dr. E. H. Reerink, H. F. L. Scholer, P. Westerhof, A. Querido, A. A. H. Kassenaar, E. Diczfalusy and K. C. Tillinger), 168
Active Tissue : Action Potentials in, with Delayed Potassium Permeability (Dr E. P. George), 889
Active Transport of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
Activities (Geomagnetic) : Correlation of Occurrence of Whistlers with (Atsushi Kimpara), 230
Activity : Determination of Small Rapid Volume Changes in a Muscle during (Prof B. C. Abbott and R J Baskin), 1055
Activity of Muscle Receptors in the Kitten (Dr. Sten Skoglund), 478
Activity in relation to *p*H of Myosin-5'-Nucleotidase (Darcy Gilmour), 295
Activity (Antibacterial), of Surface-Active Compounds : Methods for the Evaluation of the (Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry Symposium on), 131, *erratum*, 206
Activity (Biological), of Pregnant Mare Serum Gonadotropin : Effect of *p*H on (Bengt H. Persson and Stig E. J. Melander), 163
Activity (Bradykinin), of some Synthetic Peptides with only Slight Structural Resemblance to Natural Bradykinin (Dr. G. L. Tritsch and Prof. D. W. Woolley), 76
Activity (Cardiac), in Quantitative Tissue Culture Effect of Supernatant Potassium-Level on (Prof. A. W. B. Cunningham, K. Kleutch and W. Herbst), 241
Activity (Dipeptidase), of Brain (L. Lahut Uzman, Marilynn K. Rumley and Stanley van den Noort), 559
Activity (Higher Nervous) *Pavlov Journal of* (translated from the Russian), 935
Activity (5-Hydroxytryptophan Decarboxylase) : Development of, in Rat Kidney (Dr. Irene Huang, Sheila Tannenbaum and Dr David Yi-Yung Hsia), 717
Activity (Metabolic) · Neurokeratin Network of the Peripheral Nerve Fibre Myelin Sheath as a Centre of (Dr H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Activity (Phagocytic), of the Reticulo-Endothelial System : Duration of Stimulation of, after Cessation of Treatment with Diethylstilboestrol (C C. Ware and Prof T. Nicol), 974
Activity (Pyrophosphatase), in Reticulocytes : Gluathione Stability and—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells (Prof. S. Rapoport and D. Scheuch), 967

INDEX

Acton, Dr. Forman S., and others : Improvement of the Intravenous Glucose Tolerance Test, 808
Actuaries, Institute of : Election of Officers for 1960-61, 127
Acute Whole-Body Dose of X-Rays : Yeast Ribonucleic Acid and its Nucleotides as Recovery Factors in Rats receiving an (Prof. J. Maisin, P. Dumont and A. Dunjic), 487
Adams, A., and others : Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methyl*iso*thiazole), a New Antibacterial Sulphonamide, 221
Adams, A. M., and others . A Technique for Sampling Oxide Layers and Brittle Materials for Microdiffraction, 147
Adams, J. B. : Appointed interim director-general of the European Organization for Nuclear Research (CERN), 523
  Identification of Isomeric Chondroitin Sulphates, 555
  Obituary of Prof. C. J. Bakker, 761
Addiction-producing Drugs : Tenth Report of the Committee on (World Health Organization, Technical Report Series No. 188), 1018
Addink, Dr. N. W. H. : Subnormal Level of Carbonic Anhydrase in Blood of Carcinoma Patients ?, 253
Addison, Dr. Cyril Clifford : Appointed professor of inorganic chemistry in the University of Nottingham, 767 ; work of, 767
Addition Compounds between Copper Complexes and Organic Bases (R. C. Traill), 631
Adenine Dinocleotide (Nicotinic Acid) : Excretion of Nicotinic Acid and, by Biotin-deficient Yeast (Dr. Anthony H. Rose), 139
Adenine Nucleotides and Thyroxine (Succinate,) . Swelling of Fresh and Aged Liver Mitochondria as affected by (Dr. P. Emmelot, C. J Bos, P. J. Brombacher and I. H. M. Reyers), 556
Adenosine-5'-phosphate : Crystal Structure of (J. Kraut and L. H. Jensen), 798
Adenosine Triphosphate : Effect of Electrical Stimulation on a Muscle Fibre Model in the Presence of (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Adenosine Triphosphate in Bacterial Photosynthesis : Equivalence of Light and (Dr. M. Losada, Dr. A. V. Trebst, S. Ogata and Prof Daniel I. Arnon), 753
Adenosine Triphosphate (^{32}P-) Exchange Reaction in Rat Liver Mitochondria : Effects of Fatty Acids on the (K. Ahmed and Dr. P. G Scholefield), 1046
Adenosine Triphosphate and Glycogen in the Liver : Changes in the Levels of, caused by Protein Administration (Dr. Catherine M. Clark, Dr. G. A J. Goodlad, Dr. J Chisholm and Dr. H. N. Munro), 719
Adenovirus Materials (Non-infectious) : Antigenic Structure of (Dr. H. G. Pereira), 571
Adhering and Abscising Fruits of Peach treated with N-1-Naphthyl Phthalamic Acid : A Comparison of (Prof. Loyd E. Powell and Charlotte Pratt), 814
Adipose Tissue : Coenzyme A Content of (Marilyn M. Thompson and Prof. Jean Mayer), 640
Adkins, Dr. C. J. Awarded first prize (Home Awards) of the Darton Prizes of the Royal Meteorological Society, 440
Adlard, E. R., and Hill, D W. : Analysis of Anaesthetic Mixtures by Gas Chromatography, 1045
Administration . Scientists and (T. H. Hawkins), 446
Administration of β-Amino*iso*butyric Acid to the Mouse : Urinary Excretion of a Ninhydrin-positive Compound, probably a Peptide, after (Dr James B. Gilbert and Dr. Yuoh Ku), 160
Administration of Tritiated Water : Saliva–Serum Ratios of Tritium after the (Dr. A. J. Coppen and Dr. J. L. Gibbons), 724
Administration (Acetylcholine) . Intracellular Potentials in Rat Atria during and after Vagal Stimulation or (P. A. Biersteker, J. Th. F. Boeles and L. N. Bouman), 637
Administration (Lysozyme and Egg-White) : Increase in 'Alkaline' Ribonuclease of Rat Kidney Cortex after (Dr. T. Maack, Dr. R. Brentani and Dr. M. Rabinovitch), 158
Administration (Protein) . Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by (Dr. Catherine M. Clark, Dr. G. A. J. Goodlad, Dr. J Chisholm and Dr. H. N. Munro), 719
Adrenalin : Membrane Potential Changes associated with Stimulation of Smooth Muscle by (G. Burnstock), 727
Adrenals : Significance of, for Increased Oxygen Consumption in Rats during Irradiation (Dr. A. Vacek), 90
Adsorption in Double Layers involving Solid Metals Determination of (Dr. Erik A. Blomgren and Dr. John O'M. Bockris), 305
Adsorption of Helium on Carbons—Influence on Measurement of Density (Dr. F. A P. Maggs, P. H. Schwabe and J. H Williams), 956
Adsorption (Carboxylic Acid), to Steel · Effect of Moisture on (M. E. Schrader and J L. Kalinsky), 710
Adsorption (*T1* and λ Phage), on Protoplast-like Bodies of *Escherichia coli* (Dr. P. H. Hofschneider), 568
Adult *Amoeba lescherae* : Recovery of, from Dried Cultures (Monica Taylor), 329
Adult Education, National Institute of : Residential Short Courses, 685
Adult Housefly (*Musca domestica*) : Mechanisms of Resistance of the, to 'Cyclodiene' Insecticides (Dr G T. Brooks), 96
Adult Male and Nymph Development Stages of *Triatoma infestans* : Non-Identity of Triosephosphate Dehydrogenase of (Prof. M. Agosin, A. Neghme and N Scaramelli), 1052
Adult Rat : Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the (S. L Liu), 475
Adult Rat inoculated after Birth with Rous Sarcoma Tissue : Presence of Chicken Tumour Virus in the Sarcoma of the (Dr Jan Svoboda), 980
Advanced Technology, Birmingham College of : Appointment of K. L. Stretch as vice-principal, 12
Advancement of New States : Science in the (Weizmann Institute of Science International Conference on), 604
Advances in Aeronautical Sciences—Proceedings of the First International Congress on the Aeronautical Sciences, Madrid 1958 (edited by Th. von Kármán, A. M. Ballantyne, R. R. Dexter, H. Blenk, H. L. Dryden and M. Roy), *review* by Prof A. R. Collar, 665
Advances in Agronomy (edited by A. G. Norman), Vols. 10 and 11, *review* by G. V. Dyke, 1000
Advances in Coconut Research in India : Recent (Indian Central Coconut Committee Conference on), 860
Advances in Ophthalmology : Vol. 13, Documenta Ophthalmologica (edited by G. von Bahr, G B. Bietti, J. ten Doesschate, H. Fischer von Bunau, J. Francois, H. Goldman, H. K Muller, Jean Nordmann, A. J. Schaeffer and Arnold Sorsby), *review* by R. C. Davenport, 42
Advances in Plant Physiology, *review* by Prof. W. Stiles, 747
Advances in Veterinary Surgery, *review* by G. N. Gould, 667
Advisory Committee on Poisonous Substances in Agriculture and Food Storage : Appointment of Sir Charles Dodds as chairman, 934
Advisory Council (Northern), on Further Education : Training of Technical Teachers, 281
  Report for 1958-59, 281
Advisory Group for Aeronautical Research and Development (NATO) : AGARDograph No. 31, Explosions, Detonations, Flammability and Ignition, Part 1 (Prof. S. S. Penner) ; Part 2 (B. P. Mullins), *review* by Dr. H F. Coward, 666
  Meeting on Ionospheric Research, 685
  Discussion on Boundary Layer Research, 1022
Advisory Water Committee (Central) : Final Report of the Trade Effluents Sub-Committee (Ministry of Housing and Local Government), 210
Ady, Peter (edited by) : Inventory of Economic Studies concerning Africa South of the Sahara—an Annotated Reading List of Books, Articles and Official Publications (Commission for Technical Co-operation in Africa South of the Sahara, CSA/CCTA Publication No 30, Joint Project No. 4), 202
Aerial Contamination of Agricultural Land : An Assessment of the Quantities of Fission Products likely to be found in Milk in the Event of (Dr. R. J. Garner), 1063
Aerial Photogrammetry (École Nationale des Sciences Géographiques Theoretical and Technical Course on), 127
Aeronautical Research and Development, Advisory Group for (NATO) : AGARDograph No. 31, Explosions, Detonations, Flammability and Ignition, Part 1 (Prof S. S. Penner) , Part 2 (B. P. Mullins), *review* by Dr. H F Coward), 666
  Meeting on Ionospheric Research, 685
  Discussion on Boundary Layer Research, 1022
Aeronautical Sciences : Advances in—Proceedings of the First International Congress on the Aeronautical Sciences, Madrid 1958 (edited by Th von Kármán, A. M. Ballantyne, R. R. Dexter, H. Blenk, H. L. Dryden and M. Roy), *review* by Prof. A. R. Collar, 665
  Aspects of, *review* by Prof. A. R Collar, 665
Aeronautical Sciences, Institute of (United States Air Force Office of Scientific Research and the) : Second Annual Astronautics Symposium—Vistas in Astronautics, Vol. 2 (edited by Morton Alperin and Hollingsworth F. Gregory), *review* by D. G King-Hele, 59
Aeronautical Society (Royal) : Honorary Fellowships conferred on Prof. W J Duncan and Sir George Edwards, 685
  Financial grants from the Man Powered Aircraft Group for promising projects designed to further the achievement of man-powered flight, 1020
Aeronautics, College of : Appointment of J. R Ellis as professor of automobile engineering and first director of the Advanced School of Automobile Engineering at Cranfield, 762
Aether and Matter (Larmor's) : A Forerunner of Twentieth Century Physics—a Re-view of (Lancelot Law Whyte), 1010
Aetiology of Infective Diseases (Prof. Reginald Lovell), *review* by Dr. G. Lapage, 581
Affairs (World) · Present Problems in (Le Play Society Conference on), 606
Affinities of the New Olduvai Australopithecine (Dr. J. T. Robinson), 456 ; (Dr. L. S B. Leakey), 458
Africa Nature Conservation in, 935
Africa South of the Sahara : Inventory of Economic Studies concerning—an Annotated Reading List of Books, Articles and Official Publications (edited by Peter Ady), (Commission for Technical Co-operation in Africa South of the Sahara, CSA/CCTA Publication No. 30, Joint Project No. 4), 202
Africa South of the Sahara, Scientific Council for . Publication No. 37, Tenth Meeting of the Science Council, Kampala (1959), 502
Africa (East) : Agricultural Insects of (compiled by R. H. Le Pelley), *review* by Dr Kenneth Mellanby, 65
Africa (East) High Commission . East African Agriculture and Forestry Research Organization—Record of Research for 1958, 133
Africa (South) : A Mesozoic Microflora from (A. R H. Martin), 95
  True's Beaked Whale from the South-East Coast of (F H. Talbot), 406
Africa (South), Royal Society of : Election of Officers and Council for 1960, 766
Africa (West) . Blindness in (Prof. F. C. Rodger), *review* by R. C. Davenport, 64
  Variation in *Phytophthora palmivora* (Butl.) Butl on *Theobroma cacao* L. in (P. D Turner), 495
African Cultures, *review* by G. W. B. Huntingford, 38
  Continuity and Change in (edited by William R. Bascon and Melville J. Herskovits), *review* by G. W. B. Huntingford, 38
African (Central) Savannahs, *review* by J. P. M. Brenan, 505
African (East) Agriculture and Forestry (Dr. E. C. Humphries), 133
African (East) Agriculture and Forestry Research Organization : Record of Research for 1958 (East Africa High Commission), 133
African (South) Council for Scientific and Industrial Research : Register of Current Scientific Research at South African Universities, 1959 (edited by D. Ryle Masson), 854
African (South) Universities Register of Current Scientific Research at, 1959 (edited by D Ryle Masson), (South African Council for Scientific and Industrial Research), 854
African (West) Flowers A Handbook of (Harold N. Saunders), *review* by J. P. M. Brenan, 65
Africans (East) : Glucose-6-Phosphate Dehydrogenase Deficiency in Red Blood Cells of (Dr. A. C. Allison), 531
l'Afrique Centrale : Les Savanes de (Roger Sillans), *review* by J. P. M. Brenan, 505
Agadir Earthquake of February 29 (Ernest Tillotson), 199
Agar Cells (Lipophilic) · Diffusion of Proteins through (Dr. Ch. Wunderly), 885
Agar-Gel Electrophoresis · Variations in Electrophoretic Position of Haptoglobin Mixtures in (Dr Jan Hirschfeld), 894

INDEX

Agar-Gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Norman Human Sera (Dr. Jan Hirschfeld), 321
Agar-Gel (Starch–) Electrophoresis of Tuberculoproteins from Heated Culture Filtrates (T P. Dekker), 392
AGARDograph No. 31, Explosions, Detonations, Flammability and Ignition, Part 1 (Prof S. S Penner) ; Part 2 (B. P. Mullins), (NATO Advisory Group for Aeronautical Research and Development), *review* by Dr H. F. Coward, 666
Agassiz Medal of the United States National Academy of Sciences awarded to Dr. Anton Frederick Bruun, 686
Age of Emplacement of Granites (Dr. W Compston, Dr. P M. Jeffery and G. H. Riley), 702
Age of the Father : Dependence of the Sex Ratio at Birth on the (Dr. Leo Szilard), 649 ; (Dr A. Comfort), 1065
Age (Body-Weight and), in relation to the Metabolic-Rate of the Young Pig (Dr L. E. Mount and J G. Rowell), 1054
Age (Physiological), for Female *Glossina morsitans* : Determination of (D S. Saunders), 651
Age Changes in Performance : Construct 'Reactive Inhibition' in the Interpretation of (Dr S Griew and Dr. R. Lynn), 182
Age Determination in the Harbour Seal, *Phoca vitulina* L. (A. W Mansfield and H D. Fisher), 92
Age Difference in Nicotinamide Mononucleotide Synthesis by Human Erythrocytes (Dr. Vlastimil Habermann and Sona Habermannová), 389
Aged Liver Mitochondria (Fresh and) : Swelling of, as affected by Succinate, Adenine Nucleotides and Thyroxine (Dr. P. Emmelot, C. J. Bos, P. J. Brombacher and I. H. M. Reyers), 556
Ageing : Research Programmes in (United States Department of Health), 852
Ageing Neurons of some Teleosts : Cytoplasmic Inclusions of the (Prof. A. Stolk), 332
Ageing and Research, 852
Ager, Dr. D V Appointed to the University of London readership in geology at the Imperial College of Science and Technology, 522
Ages (Exposure), for Iron Meteorites (Oliver A. Schaeffer and David E. Fisher), 1040
Aggregating Proteins in the Ultracentrifuge : Concentration-Dependent Sedimentation of (Dr. G. A Gilbert), 882
Agosin, Prof M , and others : Non-Identity of Triosephosphate Dehydrogenase of Adult Male and Nymph Development Stages of *Triatoma Infestans*, 1052
Agricultural Botany, National Institute of : Thirty-ninth Report (1958), 287
Agricultural Bureaux (Commonwealth) : Plants Recorded as Resistant to Root-Knot Nematodes (*Meloidogyne* spp), (Mary T. Franklin and D. J. Hooper), 684
Agricultural Engineers, Institution of Bursaries and a Scholarship, 284
Agricultural Insects of East Africa (compiled by R H. Le Pelley), *review* by Dr. Kenneth Mellanby, 65
Agricultural Land : An Assessment of the Quantities of Fission Products likely to be found in Milk in the Event of Aerial Contamination of (Dr. R. J. Garner), 1063
Agricultural Materials in the United Kingdom, 1958-59 : Strontium-90 in Milk and (Agricultural Research Council), 852
Agricultural Meteorology (Royal Meteorological Society Symposium on), 604
Agricultural Research Council : Studentships and Fellowships, 126
  A new Weed Research Organization, 436
  Appointment of Dr. E. K. Woodford as director of the Weed Research Organization, 436
  Report No. 2, Strontium-90 in Milk and Agricultural Materials in the United Kingdom, 1958-59, 852
Agricultural Research Council and the Medical Research Council : Joint Committee on Feeding Antibiotics to Farm Animals, 280
Agricultural Sciences in the Rockefeller Foundation, 681
Agricultural Society of England (Royal) Research Medal awarded to Prof. R. L Wain, 685
Agricultural Society of India : Election of Officers, 937
Agricultural, Animal Health and Forestry Research (Colonial), Committee for : Report for 1958-59, 501
Agriculture : Increase of Settlement Size and Population since the Inception of (Dr. Max Pettersson), 870
Agriculture (Tropical) : Nitrogen in (Australian Commonwealth Scientific and Industrial Research Organization Symposium on), 941
Agriculture, Fisheries and Food, Ministry of : Appointment of an Advisory Committee on the experimental and research work of the Infestation Control Laboratory, 361
Agriculture, Fisheries and Food, Ministry of, and others : Postgraduate Training Grants in Fishery Research, 360
Agriculture and Food Storage, Advisory Committee on Poisonous Substances in : Appointment of Sir Charles Dodds as chairman, 934
Agriculture and Forestry : East African (Dr. E. C Humphries), 133
Agronomy : Advances in (edited by A. G. Norman), Vols 10 and 11, *review* by G. V Dyke, 1000
  What is ?, *review* by G V Dyke, 1000
Ahmed, K., and Scholefield, Dr. P. G : Effects of Fatty Acids on the ^{32}P-Adenosine Triphosphate Exchange Reaction in Rat Liver Mitochondria, 1046
Aikat, B. K , and others : Foetal Haemoglobin in the Monkey, 977
Air : Mortality and Viability of Insect Migrants High in the (L. R. Taylor), 410
Air Density (Upper-Atmosphere), at the Height of 180-212 km. derived from the Orbit of *Sputnik III* Profile of (Z. V Bochníček), 460
Air Force (United States), and others : Conference on Coherence Properties of Electromagnetic Radiation, 127
Air Force Office of Scientific Research (United States), and Institute of Aeronautical Sciences : Second Annual Astronautics Symposium—Vistas in Astronautics, Vol 2 (edited by Morton Alperin and Hollingsworth F. Gregory), *review* by D G King-Hele, 59
Air Pressure : New Record Low Sea-Level (C. L. Jordan), 283
Aircraft Establishment (Royal) Promotion of D G A Rendel to Deputy Chief Scientific Officer and appointment as head of the Mechanical Engineering Department, 12
Aircraft Establishment (Royal), and Semiconductors, Ltd. : The *Corsair*, a Digital Differential Analyser, 201
Aircraft Research Models : 'Araldite' in, 360
Aircraft and Guided Missiles : Use of Miniature Gyroscopes in (W. R. Simons), 522
Aktiverte Essigsaure (Dr. Karl Decker), *review* by Prof. D. C. Harrison, 66
Alberta : *Anchiceratops* from the Oldman Formation of (Wann Langston), 522
Albumin (Bovine Serum) : Iodination of Specific Sites on (Dr. David Pressman and Dr. Gerald Radzimski), 1049
Albumin, Lecithin and Cephalin : Interaction between (Dr. Eric Ponder and Ruth V. Ponder), 235
Alcohol (Isoprenoid) Dolichol, a Naturally Occurring (J F. Pennock, F W Hemming and Prof R. A Morton), 470
Alcoholic Hydroxyls of Oxycarboxylic Acids : Acidic Dissociation Constant of— Mandelic Acid (Dr. M. T. Beck and M. Halmos), 388
Alcoholic Plant Extracts : An Ion-Exchange Resin Method for the Fractionation of (Dr. Dalton Wang), 326
Aldehyde (Vitamin A^1), in Hen's Eggs (Dr. P. A. Plack), 234
Aldehydes : Behaviour of some, on a Sulphonated Polystyrene Resin (Dr. S. A. Barker, K. Murray and Prof M. Stacey), 469
Aldrich, Dr. B. I , and Newman, E. L : Visco-Elastic Systems (Couette Viscometer designed for Testing Syrup), 943
Alexander, Prof. A. E. : Elected a Fellow of the Australian Academy of Science, 519
Algae (Calcareous) in a Sediment Core from the Mindanao Trough : Fragments of (H Horn af Rantzien), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No 7), 609
Algae and Aplanospores (Unicellular) : Living and Fossil (D. M. Churchill), 493
Algal Cytochrome, *Porphyra tenera*–Cytochrome 553 : Crystallization of an (Dr Sakae Katoh), 138
Algebra (Abstract) : A Concrete Approach to (Prof W. W. Sawyer), *review*, 69, 440
Ali, Prof M A. Influence of Environment on the Distribution and Form of Sponges, 177
Aliphatic Hydrocarbons : Radiation Labelling with Carbon-14 of (Fulvio Cacace and Angelo Guarino), 632
Alivisatos, Prof S. G. A. : Mechanism of the Gastric Secretion of Hydrogen Ions, 368
Alivisatos, Prof S. G. A , and others : Non-Enzymic Reactions of Indoles with Coenzyme I, 718
Alkaline Conversion of 4-Hydroxyphenylpyruvic Acid to 4-Hydroxybenzaldehyde (Dr C. H. Doy), 529
Alkaline Oxidation of Cellulose : Catalytic Effects in the (Dr. W. A. Bell), 963
Alkaline Phosphatase in the Meninges and in Meningiomas (Dr. W. J. Pepler), 979
'Alkaline' Ribonuclease of Rat Kidney Cortex : Increase in, after Lysozyme and Egg-White Administration (Dr. T. Maack, Dr. R. Brentani and Dr M Rabinovitch), 158
Alkaloids (Pyrrolizidine) : Detection of N-Oxides of the (A. T. Dann), 1051
Alkanoate Solutions (Cupric) : Nature of (Dr. D. P. Graddon), 715
Alkylating Reagents : Non-Protein Sulphydryl Group in the Original Strain and Sub-line of the Ascites Tumour resistant to (Iwao Hirono), 1059
Alkylation of Coal by Benzyl Chloride–Aluminium Chloride (M. S. Iyengar, D. D Banerjee and D K. Banerjee), 387
All-Union Mineralogical Society (East Siberian Division) : *Zapiski Vostochno-Sibirskogo Otdeleniya Vsesoyuznogo Mineralogicheskogo Obshchestva*, Vol. 1, No 1, 683
Allele (New), in the Kidd Blood Group System : Evidence for a, in Indians of Northern Mato Grosso, Brazil (Dr. Richard T. Silver, Jame M. Haber and Dr Aaron Kellner), 481
Allen, Prof. C. W. : The Sun and its Influence, *review*, 69
Allen, Prof. G. C. : British Industries and their Organization, fourth edition, *review* by R. Brightman, 70
Allen, Prof J F : A Supplement to 'Helium', *review*, 835
Allibone, Dr T E. : Nuclear Theory and its Utilization, *review*, 917
Allison, Dr. A. C. : Glucose-6-Phosphate Dehydrogenase Deficiency in Red Blood Cells of East Africans, 531
Allner, K (Macpherson, Dr I A , and) *L* Forms of Bacteria as Contaminants in Tissue Culture, 992
Allomyces (Fungus) : Cell Wall Formation in Spores of the (J. M Aronson and Prof. R D. Preston), 95
Allotropic Transformations in Plutonium (J D. Hill), 304
Alloy (Silver–Cadmium) : Thin Films of (K Bahadur and P. V. Sastry), 467
Alloys based on the Aluminium–Zinc–Magnesium System : A Trace Element Effect in (I J. Polmear), 303
Alloys (Iridium–Platinum) : Constitution and Properties of the (Dr A. S Darling), 211
Allsopp, Dr. A , and Szweykowska, Alicja : Foliar Abnormalities, including Repeated Branching and Root Formation, Induced by Kinetin in Attached Leaves of *Marsilea*, 813
Alper, Dr. Tikvah, and others : The Sigmoid Survival Curve in Radiobiology, 1062
Alperin, Morton, and Gregory, Hollingsworth F (edited by) : Vistas in Astronautics, Vol 2 (Second Annual Astronautics Symposium sponsored by the United States Air Force Office of Scientific Research and the Institute of Aeronautical Sciences), *review* by D. G King-Hele, 59
α-L-Fucosidase Mammalian (Dr. G A Levvy), 472
α-Ketogluratate and Succinate Oxidation in E-Deficient Liver Homogenates : Maintenance of, by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr. Laurence M Corwin and Dr. Klaus Schwartz), 1048
α-Lead Azide Radiation-induced Changes in (G. Todd and E. Parry), 543
α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine : Maintenance of α-Ketoglutarate and Succinate Oxidation in E-Deficient Liver Homogenates by (Dr Laurence M Corwin and Dr Klaus Schwartz), 1048
α_2-Globulin Region of Normal Human Sera : Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxylacetate Splitting Component in the (Dr. Jan Hirschfeld), 321

αω-Dimethanesulphonoxyalkanes : Optical Properties of the (Dr. A. C. Bishop and Dr. R. D. Marshall), 74
α- and β-Chains of Globins : Separation of the, by means of Starch-gel Electrophoresis (C. J. Muller), 643
Altschule, Dr. Mark D., and others : Effects of Injection of Bovine Pineal Extract on the Nuclei of Rat Pineal Parenchymal Cells, 393
Aluminium Chloride (Benzyl Chloride—) : Alkylation of Coal by (M. S. Iyengar, D. D. Banerjee and D. K. Banerjee), 387
Aluminium Single Crystals : First Stage of Work Hardening in (N. A. McKinnon), 148
Aluminium–Zinc–Magnesium System : A Trace Element Effect in Alloys based on the (I. J. Polmear), 303
Alyavdin, V. F. : Mineralogy in the U.S.S.R., 853
Ambrose, Dr. D. : Gas Chromatography, 943
Ambs, William J. (Kruger, Jerome, and) : Reaction between Copper and Solid Oxygen condensed at Very Low Temperatures from a Gas Discharge, 794
Ambulatory and Domiciliary Medical Care : Role of Hospitals in—Second Report of the Expert Committee on Organization of Medical Care (United Nations, World Health Organization, Technical Report Series No. 176), 202
Amenities and Development in Britain, 265
America (Latin-) : Scientific Institutions and Scientists in (Unesco, Centro de Cooperacian Cientifica para America Latina), Vol. I, Paraguay ; Vol 2, Chile, 203
American Chemical Society : Scientific Russian without Tears (Prof. J. W. Perry), 359
American College Graduates : Marriage-Rate of, 22
American Cyanamid Company : Lederle Medical Student Research Fellowships, 283
American Geographical Society : Grant of 2,500 dollars from the Asia Foundation, to aid Asian libraries and Asian scholars temporarily in the United States, 126
American Industry : Science and Engineering in—Report of a 1956 Survey (United States National Science Foundation), 763
American Journal of Science : Publication of a 'Festschrift' in appreciation of the work of Dr. W. H. Bradley, chief geologist of the United States Geological Survey during 1944-59, 934
American Philosophical Society : Proceedings, Vol. 103, No. 4, A Blood Parasite from the California Yellow-legged Frog (Donald L. Lehmann), 765
  Yearbook for 1959, 850
American Phytopathological Society : Plant Pathology, Problems and Progress, 1908-1958 (edited by C. S. Holton, G W. Fischer, R W Fulton, Helen Hart and S. E. A. McCallan), *review* by W. C. Moore, 47
American Species of the Genus *Psaronius* : The Morphology and Anatomy of (Jeanne Morgan), *review* by Prof. John Walton, 190
Amide Nitrogen Content of Ovomucoid (Dr. R. D Marshall and Prof. A. Neuberger), 311
Amines (Catechol) : Effects of 1,4-Dihydrazinophthalazine on the (M. Bygdeman and L. Stjärne), 82
Amines (Catechol), Dihydroxyphenylalanine and 5-Hydroxyindoles : Vanadium Catalysis of the Oxidation of (Dr. G. M. Martin, E. P. Benditt and N. Eriksen), 884
Amini, E. : Appointed lecturer in mechanical engineering at the University of Birmingham, 522, 767
Amino-Acid Composition of Proteins from Surface Tissue of the Tongue (Dr. C. J. Barnes and Dr L. N. Ferguson), 617
Amino-Acids : Antioxidative Effect of (Dr. Reinhard Marcuse), 886
  Localization of, for Histochemical Estimation (Helen M Notovny and Robert G. Owens), 1057
3-Amino-1,2,4-triazole : Effect of, on the Experimental Production of Liver Cancer (Munemitsu Hoshino), 174
γ-Aminobutyric Acid in Brain Cortex Slices : Active Transport of, with special reference to Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
S-β-Aminoethyl*iso*thiouronium Bromide Hydrobromide : Effect of, on X-Ray Damage to Guinea Pig Skin (Dr. J. B. Walter and Prof. D. Slome), 177
β-Amino*iso*butyric Acid : Urinary Excretion of Ninhydrin-positive Compound, probably a Peptide, after Administration of, to the Mouse (Dr. James B Gilbert and Dr. Yuoh Ku), 160
Aminopyrine Analgesia (Morphine, Dihydrocodeine and) : Synergetic Actions of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J. L. J Szabó and M. Stamburgo), 893
Ammal, Dr. E. K. Janaki : Retirement from the directorship of the Central Botanical Laboratory, Allahabad, 519 ; work of, 519
Ammocoetes : Sex Ratio of (M. W. Hardisty), 988
Ammonia adsorbed on Silica–Alumina Catalysts : Infra-Red Spectra of (D. E. Nicholson), 630
Ammonia Plant (New), to be built at Severnside (Imperial Chemical Industries, Ltd.), 202
Amnion (Human) : Ultra-Structure of, and its Possible Relation to the Circulation of Amniotic Fluid (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Amniotic Fluid : Ultra-Structure of Human Amnion and its Possible Relation to the Circulation of (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Amoeba lescherae (Adult) : Recovery of, from Dried Cultures (Monica Taylor), 329
Amoebidium Parasiticum (Trichomycete) : Pure Culture of the (Dr. Howard C. Whister), 732
Amphibians : Control of Colour Change in (C. Barker Jørgensen and Lis Olesen Larsen), 641
Amphibians and Reptiles : Poisonous (Prof. Floyd Boys and Prof Hobart M. Smith), *review* by A. G. C. Grandison, 269
Amphoteric Metals : Photo-stimulated Emission of Exo-electrons from the Surface Layer of, reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide (J. Wawrzyniak and Dr B Sujak), 467
Amplification (Parametric) : Experiments in the Field of (B Bollée and G. de Vries), 1019
Amsterdam, Dr. Daniel, and Schneierson, Dr. S. Stanley : Enhancement of Staphylococcal Virulence for Mice by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin, 101
Anacystis nidulans : A Methyl Cytidine from the Ribonucleic Acid of (Dr. B. B. Biswas and J. Myers), 238
Anaemia (Sickle-Cell), in Nigerian Children (R. G. Hendrickse), 1027
Anaerobes (Obligate) : Specific Inhibition of (Dr. Herbert N. Prince), 816
Anaesthetic Mixtures : Analysis of, by Gas Chromatography (E. R. Adlard and D W. Hill), 1045
Analgesia (Morphine, Dihydrocodeine and Aminopyrine) : Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J L. J Szabó and M. Stamburgo), 893
Analogues (Base) : Reversions induced by, in *Salmonella typhimurium* (Rivka Rudner and Elias Balbinder), 180
Analogy to the Kirkendall Effect in the Gas Phase (L. Miller and P. C. Carman), 549
Analyse de Variance et Plans d'Expérience (Prof. Daniel Dugué et Prof. Maurice Girault), *review* by Dr. D. J. Finney, 68
Analyser : The *Corsair*, a Digital Differential (Royal Aircraft Establishment and Semiconductors, Ltd), 201
Analyses (Chemical), of Rocks, *review* by Prof. K. C. Dunham, 56
Analysis : Microquantitative Infra-Red—Application to Gas Chromatographic Fractions (J E. Stewart, R. O. Brace, T. Johns and W. F. Ulrich), 628
Analysis of Accelerated Motion in the Theory of Relativity (Robert T. Jones), 790
Analysis of Anaesthetic Mixtures by Gas Chromatography (E. R. Adlard and D. W. Hill), 1045
Analysis of the Paragenesis of Minerals : Physiochemical Basis of the (D S. Korzhinskii), translated from the Russian, *review* by Dr. Bernard E. Leake, 745
Analysis (Qualitative), of Volatile Mercaptan Mixtures : A Rapid Method for (John F. Carson, William J Weston and Jack W. Ralls), 801
Analysis (Sterol), by Gas Chromatography (R. K. Beerthuis and J. H. Recourt), 373
Analysis (Trace), by X-Ray Fluorescence using Ion Exchange Resins (J. N. van Niekerk and J. F de Wet), 380
Analytical Chemistry of Polymers (edited by Gordon M Kline), Part I, Analysis of Monomers and Polymeric Materials–Plastics, Resins, Rubbers, Fibres, *review* by Prof. C. E. H Bawn, 52
Anaphylactic Release of Histamine from Chopped Guinea Pig Lung : Inhibition of the, by Chymotrypsin Substrates and Inhibitors (Dr. K. F. Austen and Dr. W E. Brocklehurst), 866
Anatomy of American Species of the Genus *Psaronius* : The Morphology and (Jeanne Morgan), *review* by Prof John Walton, 190
Anatomy (Human) : The Teaching of Veterinary Anatomy as a Branch of Biology—its Relationships to (Dr. R A. Green), 192
Anatomy (Veterinary), as a Branch of Biology : The Teaching of—its Relationships to Human Anatomy (Dr. R. A Green), 192
Anchicerotops from the Oldman Formation of Alberta (Wann Langston), 522
Anderer, F. A., and others : Primary Structure of the Protein of Tobacco Mosaic Virus, 922
Anderson, Harry G : Food Habits of Migratory Ducks, 17
Anderson, Prof H L. : Elected a member of the United States National Academy of Sciences, 773
Anderson, Dr. W , and others : Detection of Recently Produced Fission Products in the Atmosphere, 223
  Radioactive Fallout during 1959, 925
Andrade, Prof. E. N. da C : Growth of Single Crystals of Copper, 540
Andrew, C. S. : Nitrogen in Tropical Agriculture (Growth of Legumes in Acid Soils), 941
Andrew, Prof E. A : A Structural Tool for the Chemist, *review*, 55
Andrews, Dr Roy Chapman : *Obituary* by Dr. W. E. Swinton, 594
Andronikashvili, E. L. (Lifshits, E. M., and) : A Supplement to 'Helium', (translated from the Russian), *review* by Prof J. F. Allen, 835
Anglia (East) : Investigating Glacial and Interglacial Geology in (Dr. R. G. West), 771
Anglian (East) Butterflies : Some (S. Beaufoy), 771
Anglian (East) Mammals (Lord Cranbrook), 770
Angyal, Dr. S J. : Appointed to the chair of organic chemistry in the University of New South Wales, 357 ; work of, 357
Anhydrase (Carbonic) : Subnormal Level of, in Blood of Carcinoma Patients ? (Dr N W H. Addink), 253
Animal (a Cold- and a Warm-Blooded) : Influence of Temperature upon Blood Coagulation in (Dr. H. B. Anstall and Dr. R. G. Huntsman), 726
Animal Cells : Fractionation of Two Metabolically Distinct Classes of Ribonucleic Acids in, and its Bearings on Cancer (Prof A. Sibatani, K. Yamana, K. Kimura and T. Takahashi), 215
Animal Experiments : Combined Application of Hydrogen Peroxide and Ionizing Rays in (E Fleischmann, H. Werkgartner and K. Karrer), 324
Animal Health Yearbook 1959 (Food and Agriculture Organization of the United Nations), 281
Animal Husbandry : Tropical, *review* by Sir John Hammond, 49
Animal Husbandry in the Tropics An Introduction to (G Williamson and Dr. W. J A. Payne), *review* by Sir John Hammond, 49
Animal Reproduction : Ford Research Fellowships in (Zoological Society of London), 519
Animal Tissues : Effects of Non-Ionic Surfactants upon (Helen Goldhammer and W R McManus), 317
Animals : Precipitating Antibody in Trypanosomiasis of Cattle and other (A. R. Gray), 1058
Animals Move : How (Sir James Gray), *review* by Dr. N. B. Marshall, 921
Animals (Farm) : Feeding Antibiotics to (Agricultural Research Council and the Medical Research Council Joint Committee on), 280
Animals (Freshwater Invertebrate) : A Guide to (Dr. T. T. Macan), *review* by Dr J P Harding, 345
Animals (Laboratory), in the Standardization of Drugs : The Use of (Research Defence Society, Pamphlet No. 10), 438
Animals (Pond) . Suffolk Ponds and (J. E. Marston), 771
Animals and Man Actinomycins and their Importance in the Treatment of Tumours in (New York Academy of Sciences Conference on), 771
Anion Exchanger : Fractionation of Heparin on an (Dr. J. P. Green), 472
Anisotropy of Susceptibility and the Natural Remanent Magnetization of some Welsh Slates (M. D. Fuller), 791
Annealing : Magnetic, 439
Annelid (Enchytraeid) : Monoxenic Cultivation of an (Dr. Ellsworth C. Dougherty and Bjørn Solberg), 1067

INDEX

Annual: The Veterinary, 1959 (edited by W A Pool), review by G N. Gould, 667
Annual Review of Microbiology (edited by Charles E. Clifton, Sidney Raffel and Mortimer P Starr), Vol. 13, review by Dr. B. A. Newton, 49
Annual Review of Plant Physiology (edited by Leonard Machlis, in association with John G Torrey), Vol. 10, review by Prof W Stiles, 747
Anomalies in the Microscopic Structure of some Wools (T. D. Brown and W. J. Onions), 93
Anopheles pharoensis Theobald Normal Susceptibility Levels of, to DDT and Dieldrin (Dr. F. Kuhlow), 410
Anstall, Dr. H. B , and Huntsman, Dr. R. G Influence of Temperature upon Blood Coagulation in a Cold- and a Warm-blooded Animal, 726
Antarctic Atmosphere : Temperature Changes in the (Dr. H. Wexler), 445
Antarctic Expedition : The New Zealand (Sir Edmund Hillary), 526
Antarctica : Lower Tertiary Microfossils from McMurdo Sound (Dr. Lucy M. Cranwell (Mrs Watson Smith), Dr. H J. Harrington and I G. Speden), 700
 Scientific Research in, 212
Antecedents of Man (Prof Sir Wilfrid E Le Gros Clark), review by Dr. G G Simpson, 665
Anthelmintic Efficiency of Tetrachlorodifluoroethane against *Fasciola hepatica* in Sheep (J. C Boray and I G Pearson), 252
Anthropological Institute (Royal) : Occasional Publication No. 13, The ABO Blood Groups (Dr A E Mourant, Ada C Kopeć and Kazimiera Domaniewska-Sobczak), review by Dr. F. Stratton, 581
Anthropology Contributions to (National Museum of Canada, Bulletin No. 162), 1017
Antibacterial Activity of Surface-Active Compounds : Methods for the Evaluation of the (Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry Symposium on), 131, *erratum*, 206
Antibacterial Sulphonamide Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methyl*iso*thiazole), a New (A. Adams, W. A. Freeman, A. Holland, D. Hossack, J. Inglis, J Parkinson, H W. Reading, K. Rivett, R Slack, R Sutherland and R Wren), 221
Antibiotics : Feeding, to Farm Animals (Agricultural Research Council and the Medical Research Council Joint Committee on), 280
Antibody : An Rh, Specific for V and R's (Dr Ruth Sanger, Jean Noades, Patricia Tippett, Dr R R. Race, J. A. Jack and Dr. C. A. Cunningham), 171
Antibody (Precipitating), in Trypanosomiasis of Cattle and other Animals (A R. Gray), 1058
Antibody and Complement : Effect of, on Volume Control in an Ascites Tumour Cell (Dr H Green and Dr. F Silverblatt), 646
Antigen M (Human Blood-Group) M_1, a Subdivision of the (J. A. Jack, Patricia Tippett, Jean Noades, Dr Ruth Sanger and Dr. R R Race), 642
Antigen 15 (Somatic), as a Precursor of Antigen 34 in *Salmonella* (Hisao Uetake and Shin Hagiwara), 261
Antigen 34 in *Salmonella* : Somatic Antigen 15 as a Precursor of (Hisao Uetake and Shin Hagiwara), 261
Antigen-Induced Damage to Isolated Sensitized Mast Cells (Dr. I Mota and W. Dias da Silva), 245
Antigenic Structure of Non-Infectious Adenovirus Materials (Dr. H G. Pereira), 571
Antigens, Transplantation and Tolerance, *review* by Dr. D M. V. Parrott, 51
Antigens (Immobilization), of *Paramecium aurelia* : Genetical and Biochemical Studies of the (J. O Bishop and Dr. G. H Beale), 734
Antigens (*Salmonella*) : The a-z-z_{38} Group of (Leonard Schrire), 569
Antiglobin Serum (Rabbit) : Observations on Globin, Haemoglobin and Haptoglobin using a (D S Rowe and J. F. Soothill), 975
Antiglobulin Reaction : Role of C'_4 in the (G C. Jenkins, Margaret J. Polley and Dr. P L. Mollison), 482
Anti-Inflammatory Action of Corticosteroids : Accumulation of Substrate by Isolated Rat Diaphragm—a Possible Mechanism for the (Prof. Ira G. Wool), 728
Anti-Locust Research Centre : Report of the Director for 1958-59, 501
Antimalarial Properties of some Guanidine Derivatives (Y. Ch. Chin, Y Y. Wu, B. Skowrońska-Serafin, Prof T Urbański and J. Venulet), 170
Antimetabolite (Riboflavin) Ackee Toxin, a (H C Fox and D S Miller), 561
Antioxidative Effect of Amino-Acids (Dr. Reinhard Marcuse), 886
Antipyretic Action of *l*-Phenyl-3,5-pyrazolidinedione (Salah A. Tawab, Prof Ahmed Mustafa and Mohamed Kira), 165
Antithromboplastin in Human Serum and Plasma (Dr. T. G. Scott, Dr. C. Symons and R L. Markham), 248
Antoni, F , and others : Heterogeneity of Tumour Ribonucleic Acid and the Effect of 'Degranol' on it, 81
Antonini, E (Rossi-Fanelli, Prof A , and) : Oxygen Equilibrium of Haemoglobin from *Thunnus thynnus*, 895
Antonini, E., and others : Oxygen Equilibrium of Myoglobin from *Thunnus thynnus*, 896
Antony, J Recent Advances in Coconut Research in India, 862
Aortas (Normal and Atherosclerotic), from Chickens receiving Differently Saturated Fats for Three Years : Essential Fatty Acids of (Prof. H. Fisher and A S Feigenbaum), 85
Aortic, Serum, Connective Tissue and Osseous Chemistry in Lathyritic Rats (Dr. R. A. Grant, M Hathorn and Prof Theodore Gillman), 164
Aortitis (Chronic), in the California Sea-lion, *Zalophus californianus* (Dr. Arthur L Kelly and Dr David Jensen), 731
Aoyagi, Masaya, and others : A Micro Gas Chromatograph, 309
Apidium and *Oreopithecus* (Dr. Elwyn L Simons), 824
Aplanospores (Unicellular Algae and) Living and Fossil (D M. Churchill), 493
Aplysia depilans L. : Yolk Formation in Oocytes of *Patella coerulea* L. and, as observed in the Electron Microscope (A. Bolognani), 490
Apoferritin : X-Ray Diffraction Study of Denatured Ferritin and (Vladimir Kleinwachter), 313
Apoje, Nigeria : Grooved Rocks at (William Fagg), 205
Apparatus for Panning in Ciné Micrography (Dr. W. H. Hughes and Dr. P. N. Cardew), 258
Apparent Double Crossing-Over in a Short Genetic Interval in *Drosophila melanogaster* (Prof M M Green), 990
Apparent Radio Radiation at 11-m Wave-Length from Venus (Dr J. D. Kraus), 462
Apple : Changes in Structure of a Periclinal Chromosomal Chimera of, following X-Irradiation (Charlotte Pratt), 255
Apple Fruits (Tomato and) : Ethylene Production by (D. F Meigh, K. H Norris, C C Craft and M Lieberman), 902
Applegate, Howard G. : Freezing-Point Depressions of Hoagland's 'Carbowax' Systems, 232
Appleton, A A : Industrial Chemistry of the Lower Olefines (Production and Utilization of Butadiene), 285
Application to Body-centred Cubic Lithium An Energy Band Interpolation Scheme, with (J. F. Cornwell and Dr E. P Wohlfarth), 379
Application to the Feulgen Reaction : A New Technique for Studying the Quantitative Aspects of Cytochemical Reactions and its (P. van Duijn and J. -P Persijn), 805
Application to Gas Chromatographic Fractions : Microquantitative Infra-Red Analysis— (J E. Stewart, R. O Brace, T. Johns and W. F. Ulrich), 628
Application of Pyramidone to Detection of Nitrous Acid (Dr Wiktor Wawrzyczek), 883
Application to the Resolution of Human Haemoglobin Variants A New Electrophoretic Medium and its (Dr. E. R Huehns and Dr A. O. Jakubovic), 729
Application (Combined), of Hydrogen Peroxide and Ionizing Rays in Animal Experiments (E Fleischmann, H Werkgartner and K Karrer), 324
Applications to Controlled Thermonuclear Reactions : Bibliography on Plasma Physics and Magnetohydrodynamics and their (J. D Ramer), 522
Applications of the Electron Microscope : Techniques and (Cornell University Summer Laboratory Course in), 127
Applications in Medicine and the Biological Sciences Elementary Statistics with (Prof Frederick E Croxton), *review* by R. M Cormack, 746
Applications of Nuclear Science for Peaceful Purposes : Recent Developments in the (CENTO Institute of Nuclear Science Symposium on), 685
Applications to Organic Chemistry : Nuclear Magnetic Resonance— (Prof. J D. Roberts), *review* by Prof E R Andrew, 55
Applications de la Thermodynamique Chimique Bases Fondamentales et (Prof Maurice Dodé), Tome 1, Les Principes, les Systèmes ideaux Gazeux, et avec Phases Condensées pures, *review* by Prof A. R Ubbelohde, 55
Applications (Spectroscopic), of Photographic Emulsion Mosaics (Prof R. W. Nicholls), 715
Applied Arts and Sciences, Museum of (Sydney) : Annual Report for 1958, 683
Applied Bacteriology, Society for Annual Meeting and Summer Conference, 523
Applied Bacteriology, Society for, and the Microbiology Group of the Society of Chemical Industry : Symposium on Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds, 131, *erratum*, 206
Applied Biologists, Association of, and the British Mycological Society Symposium on the Nature and Exploitation of Crop Plant Resistance to Disease, 857
Applied Hydrodynamics (H. R. Vallentine), *review* by E. P. Sutton, 669
Applied Radiation Chemistry, *review* by Prof. F. S. Dainton, 344
Applied Research (Fundamental and) : The Balance of, 341
Appointments in Industry and Commerce, 682
Apprenticeship Training in Britain, 436
Approach (A Biochemical), to Pathology (M. J R Dawkins and Dr K R. Rees), *review* by Dr. R. W. R. Baker, 921
Approach (A Concrete), to Abstract Algebra (Prof. W. W. Sawyer), *review*, 69, 440
Approach (Russian), to Mineral Paragenesis, *review* by Dr Bernard E Leake, 745
Aptitude (Arts/Science) A Differential Test of (L Hudson), 413
Aquatic (Sub-) Medicine (Club Alpin Sous-Marin International Colloquium on), 440
Äquatorialen Atlantiks Ein Beitrag zum Problem der Tiefseesande im westlichen Teil des (F W Focher), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 5), 609
Aqueous Solution (Dilute) : Chemical Effects of Ionizing Radiation on Deoxyribonucleic Acid in (G Hems), 710
Aqueous Solutions : Use of Nitrous Oxide to discriminate between the Forms of Hydrogen Atoms (H and H_2^+) produced by γ-Irradiation of (Prof F. S. Dainton and Dr. D. B. Peterson), 878
Aqueous Solutions under Ionizing Radiation : Significance of the 'Equivalent Redox Potential' in (Dr. G. H. Cartledge), 370
Aqueous Solutions of Potassium Iodide irradiated with Ultra-violet Light : Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in (Prof F S. Dainton and S. A. Sills), 879
Aquivalenter Grundlage : Petrochemische Berechnungsmethoden auf (Prof Conrad Burri), *review* by Prof K C Dunham, 56
Aradidae : The, *review* by R G. Fennah, 46
Aradidae (*Hemiptera-Heteroptera*) : Classification of the (Prof Robert L. Usinger and Ryuichi Matsuda), *review* by R G Fennah, 46
'Araldite' in Aircraft Research Models, 360
Arber, Dr Agnes : *Obituary* by Dr H. Hamshaw Thomas, 847
Arc Movement : Effect of Cathode Surface Roughness and Oxidation on (Dr. T. J Lewis and Dr. P. E. Secker), 30
Archaeology Scientific Techniques in Art and (Dr A. E. Werner), 674
Archaeology in Suffolk (N. Smedley), 770
Architecture : Psychiatric Services and (A. Baker, R Llewelyn Davies and P Sivadon), (United Nations, World Health Organization, Public Health Papers No 1), 936
Are Macromolecules required for Growth of Single Isolated Mammalian Cells ? (Ralph B Gwatkin), 984
Arid Zone Problems (Unesco Symposium on), 284
Armstrong, J McD. and others A New Type of Autoxidation Reaction—Flavin Dissociation and Inactivation of Cytochrome b_5 by Oxygen, 1033
Armstrong, L. D. : Visco-Elastic Systems (Experimental Evidence on the Great Increase in Creep of Wood when changes in Moisture Content take place while the Material is Loaded), 943

Astronomy, a Textbook for University and College Students (Dr. Robert H Baker), seventh edition, *review* by D. H P. Jones, 69
Astronomy in Australia—Stellar Interferometer of the School of Physics, University of Sydney, 270
Astronomy (Physics and): From Nucleus to Universe—a Course of Selected Lectures in (University of Sydney, 1960), (edited by Prof. S. T. Butler and Prof. H Messel), *review* by G. R. Noakes, 748
Astronomy (Radio): An Easy Guide to, *review* by Dr J S. Hey, 59
Asunmaa, Saara K. · Silver-activated Nitrocellulose as Recording Material for X-Ray Microscopy, 1036
Asymmetry in a Water-boatman (*Krizousa-corixa femorata*): Inheritance of (Dr. Walter Peters), 737
Ataxia in Hens poisoned by Tri*para*ethylphenyl Phosphate (Ann Silver), 766
Athay, R. Grant: Rocket and Satellite Observations of the Solar Ultraviolet Spectrum, 1036
Atherosclerotic Aortas (Normal and), from Chickens receiving Differently Saturated Fats for Three Years: Essential Fatty Acids of (Prof. H Fisher and A. S Feigenbaum), 85
Atkin, N. B (Pearson, Dr A. E. G., and): Changes in the Deoxyribonucleic Acid Content of Mouse Sarcoma 37 Cells following Serial Irradiation, 647
Atkins, Prof. K R: Liquid Helium, *review* by Dr. J. G Valatin, 345
Atlantic Ocean: Strontium-90 in the 'Mixed Layer' of the (Dr. Vaughan T. Bowen and Prof Thomas T. Sugihara), 71
Atlantic Ocean (North). Sediment Cores from the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Nos 4-5), 609
Atlantiks (aquatorialen): Ein Beitrag zum Problem der Tiefseesande im westlichen Teil des (F W. Locher), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No 5), 609
Atmosphere Detection of Recently Produced Fission Products in the (Dr. W. Anderson, Dr. R. E Bentley, L. K. Burton and Dr. C. A Greatorex), 223
  Radioactivity of the, due to Distant Nuclear Test Explosions (D H Peirson, R. N. Crooks and E. M. R. Fisher), 224
Atmosphere (Antarctic): Temperature Changes in the (Dr. H. Wexler), 445
Atmosphere (Upper) · Density of the, and its Dependence on the Sun, as revealed by Satellite Orbits (D. G. King-Hele and D. M. C. Walker), 928
Atmosphere (Upper-) Air Density at the Height of 180-212 km. derived from the Orbit of *Sputnik III*: Profile of (Z. V. Bochníček), 460
Atmospheric Radio Noise · Observations of (G R. A. Ellis), 229
Atmospheric Tracer · Use of Long-lived Natural Radioactivity as an (W M Burton and N G. Stewart), 584
Atomfysik (Teoretisk), Nordisk Institut for (Copenhagen): Årsberetning (1957-58), 850
Atomic Absorption Spectroscopy: Determination of Calcium in Blood Serum by (J. B Willis), 249
Atomic Clock: Preliminary Flight Tests of an, in Preparation of Long-range Clock Synchronization Experiments (Friedrich H. Reder and Gernot M R. Winkler), 592
Atomic Energy: The Peaceful Uses of (Proceedings of the Second United Nations International Conference on, held in Geneva, 1958), Vol. 2, Survey of Raw Material Resources, *review* by Prof. C F. Davidson, 921
  World List of Institutions concerned with (International Atomic Energy Agency), 361
Atomic Energy Agency (International): Appointment of Prof. C Salvetti as director of the Division of Research and Laboratories, 17
  International Directory of Radioisotopes, Vol. I, Unprocessed and Processed Radioisotope Preparations and Special Radiation Sources: Vol. 2, Compounds of Carbon-14, Hydrogen-3, Iodine-131, Phosphorus-32 and Sulphur-35, 282
  Scientific Conference (Use of Radioisotopes in the Physical Sciences and Industry), 284
  General Publication No. 3, World List of Institutions concerned with Atomic Energy, 361
  Appointment of Dr Gerald B Cook as chief chemist, 854
  Assistance Programme, 855
Atomic Energy Authority (United Kingdom), (Production Group and Development and Engineering Group): Fifth Report from the Select Committee on Estimates, Session 1958-59, I
Atomic Energy Commission (Australian): Conference on the Technological Use of Radiation, 126
Atomic Energy Commission (Danish) · International Summer Course on Plasma Physics, 938
Atomic Energy Research Establishment · Appointment of B S. Smith as head of the Isotope Research Division, 933
  Appointment of N. G Stewart as head of the Health Physics Division, 933
Atomic Physics in Norway, 850
Atomic Terminology, a Dictionary of Nuclear Science, Engineering and Technology in Four Languages (English–German–French–Italian), (compiled by Dr Lore Lettenmeyer), *review* by Dr J. B. Sykes, 67
Atomnaya Energiya · Vol. 3, No 11, Soviet Reviews of Nuclear Science on the 40th Anniversary of the October Revolution, *review* by Dr T. E. Allibone, 917
Atoms for Peace Award for 1959 awarded jointly to Prof. Leo Szilard and Prof Eugene P. Wigner, 357
Atoms for Peace Award for 1960 awarded jointly to Dr. Walter H Zinn and Dr. Alvin M. Weinberg, 357
Atoms (Hydrogen): Mechanism of the Oxidation and Reduction of Metal Ions by (Prof J. Halpern, G. Czapski, J. Jortner and Dr. G. Stein), 629
Atoms (Hydrogen), existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-violet Light · Use of Nitrous Oxide to discriminate between Various Forms of (Prof F S. Dainton and S A. Sills), 879
Atoms (Hydrogen) (H· and H_2^+?) produced by γ-Irradiation of Aqueous Solutions: Use of Nitrous Oxide to discriminate between the Forms of (Prof F S Dainton and Dr D B Peterson), 878

Atria (Rat) : Intracellular Potentials in, during and after Vagal Stimulation or Acetylcholine Administration (P. A. Biersteker, J. Th. F. Boeles and L. N. Bouman), 637
Auricchio, S., and others : Interrelation of Tryptophan and Nicotinic Acid in Man during the First Month of Life, 639
Auroral Zone (Southern) · Geometry of the, and the Evidence for the Existence of an Inner Zone (Dr. T Hatherton), 288
Austen, Dr. K F., and Brocklehurst, Dr. W E : Inhibition of the Anaphylactic Release of Histamine from Chopped Guinea Pig Lung by Chymotrypsin Substrates and Inhibitors, 866
Australasian Conference on Radiation Biology, 938
Australia : Astronomy in—Stellar Interferometer of the School of Physics, University of Sydney, 270
  Mistletoe in (G. C. Greenham), 135
  Rheology in (Dr P. U. A. Grossman), 941
Australia (South) : Late Precambrian Fauna in (M F Glaessner and B. Daily), 205
Australian Academy of Science : Election of new Fellows, 519
  Thomas Ranken Lyle Medal for 1959 presented to Prof E S. Barnes, 519
Australian Atomic Energy Commission : Conference on the Technological Use of Radiation, 126
Australian Cattle Tick . Sulphydryl Content of the Embryos of the (W. J. Roulston and C. A. Schuntner), 1069
Australian Commonwealth Scientific and Industrial Research Organization · Appointment of Lord Casey and E. P. S. Roberts as members of the Executive, 12
  Rural Research, 29, Mistletoe in Australia (G. C Greenham), 135
  Appointment of Dr Geoffrey Kesteven as director of fisheries research in the Division of Fisheries and Oceanography at Cronulla, 280
  Appointment of Dr Douglas F. Waterhouse as chief of the Division of Entomology, 763
  Symposium on Nitrogen in Tropical Agriculture, 941
  Symposium on Visco-Elastic Systems, 942
Australian Defence Standards Laboratories : Annual Report (1958-59), 366
Australian Irradiation Conference, 126
Australian Museum · Exhibit entitled 'These are Invertebrates', 438
Australopithecine (Olduvai) The Affinities of the New (Dr J. T. Robinson), 456 ; (Dr L S B Leakey), 458
Australopithecine Tools (Prof R. A. Dart, Dr. Kitching and Revil J. Mason), 205
Austria and Germany Frequencies of the Haptoglobin Serum Groups among Blood Donors from (Dr. H. Baitsch, G. Meier, L. Scogller and D. M. Kahlich-Koenner), 976
Austrian Academy of Science (German Academy of Science and the) : Preparation of an edition of the letters of Alexander von Humboldt (1769-1859), 685
Autocatalytic Particles and Steady States (Dr. Allan Campbell), 256
Automatic Control : First International Congress on, 439
Automatic Control in Soviet Industry (Department of Scientific and Industrial Research), 287
Automation : Study Group on the Mental Health Problems of (World Health Organization, Report Series No. 183), 364
Automation and its Human Repercussions, 364
Automobile Engineering, Advanced School of (Cranfield) · Appointment of J. R. Ellis as professor of automobile engineering and first director, 762
Autoxidation Reaction A New Type of—Cause of the Instability of Cytochrome c Reductase (Dr. Malcolm Dixon, J. M. Maynard and P. F. W. Morrow), 1032 ; Flavin Dissociation and Inactivation of Cytochrome b_2 by Oxygen (J. McD. Armstrong, Dr. J H. Coates and Prof. R K Morton), 1033
Auxiliary Grid · Use of an, to stabilize the Gain of a Photomultiplier (Dr. C. F G. Delaney and Dr. A J. Walton), 625
Aviation, Ministry of Promotion of D. G A. Rendel to Deputy Chief Scientific Officer and appointment as head of the Mechanical Engineering Department of the Royal Aircraft Establishment, 12
  Promotion of E. B. Carter to Deputy Chief Scientific Officer and appointment as director of engine production, 518
  Promotion of J D Clare to Deputy Chief Scientific Officer and appointment as director of guided weapons research and development (Air), 518
Axelrod, Daniel I (Chaney, Ralph W., and) : Miocene Floras of the Columbia Plateau, Part 2, Systematic Considerations, *review* by Prof. J. Walton, 66
Azam, M N, and Dickinson, H. : Time-lags in the Intrinsic Electrical Breakdown of Glass, 146
Azide (α-Lead) : Radiation-induced Changes in (G Todd and E. Parry), 543
Azotobacter vinelandii · Nitrogen Fixation in Extracts of (Dr D. J D. Nicholas and D J Fisher), 735

BAARLI, J (Madshus, K, and) Radiocaesium and Potassium-40 in Norwegian-produced Milk, 527
Baas Becking, Dr. L. G M., and Moore, Dr. D. · Iron Bacteria in Mine-waters, 670
Bacilli (Phenol-killed Tubercle) : Enhanced Resistance of Mice to Infection with *Pasteurella pestis* following Vaccination with Fractions of (Prof. David W. Weiss), 1060
Bacillus subtilis : Physiology of D-Glutamic Acid-resisting Mutants of (Haruo Momose and Prof. Yônosuke Ikeda), 818
Bacillus subtilis (Mutants of), requiring D-Glutamic Acid : Isolation of (Haruo Momose and Prof. Yônosuke Ikeda), 567
Back, Dr. —. (MacIver, Dr. —., and) · Medical Research in the British Caribbean (Megaloblastic Anaemia in Malnourished Infants), 863
Backeberg, Curt · Die Cactaceae, Band 3, Cereoideae (Austrocactinae), *review*, 347
Bacon, F. T Fuel Cells—Will they soon Become a Major Source of Electrical Energy?, 589
Bacq, Prof. Zenon M, and Beaumariage, Dr. Marie L. : Inability of Methionine to affect Lethality in Mice and Rats exposed to X-Rays, 1064
Bacteria : Fate of, in the Small Intestine (J. M. S. Dixon), 521
  L Forms of, as Contaminants in Tissue Culture (Dr I A. Macpherson and K Allner), 992
Bacteria (Iron), in Mine-waters (Dr L G. M Baas Becking and Dr. D. Moore), 670
Bacterial Dextranase : Action of a, on Branched Dextrans (R. W. Bailey, Dr. D. H. Hutson and Dr. H. Weigel), 553
Bacterial Flora of Roots : Influence of Light on (J. W. Rouatt and Dr. H. Katznelson), 659
Bacterial Photosynthesis : Equivalence of Light and Adenosine Triphosphate in (Dr. M Losada, Dr A. V. Trebst, S Ogata and Prof. Daniel I Arnon), 753
Bacterial Physiology : An Introduction to (E L Oginsky and Wayne W. Umbreit), second edition, *review* by Dr. R H. Gorrill, 111
Bacterially Mediated False-Positive Reactions in Lytic Blood-Typing Tests (Prof Clyde Stormont, Yoshiko Suzuki and W. J. Miller), 247
Bacteriology at St Mary's Hospital, London, 1016
Bacteriology : A Guide to the History of (Prof. Thomas H. Grainer, Jr), *review* by Dr R H. Gorrill, 111
  Text-Book of, *review* by Dr R H. Gorrill, 111
  A Text-Book of (Dr R. W. Fairbrother), eighth edition, *review* by Dr. R. H. Gorrill, 111
Bacteriology (Applied), Society for Annual Meeting and Summer Conference, 523
Bacteriology (Applied), Society for, and the Microbiology Group of the Society of Chemical Industry . Symposium on Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds, 131, *erratum*, 206
Bacteriophage in the Presence of Sulphydryl Compounds · Effect of Oxygen on the Radiosensitivity of (Dr. P Howard-Flanders), 485
Baddeley, A D, and others · Letter Structure of the English Language, 414
Baden-Powell, D F W. The Pleistocene Era, *review*, 833
Badger, Prof G M · Elected a Fellow of the Australian Academy of Science, 519
Baez, Dr. Albert V . A Self-supporting Metal Fresnel Zone-plate to Focus Extreme Ultra-violet and Soft X-Rays, 958

β-Acetamidoglutarate (Diethyl) · Requirements for Stereospecificity in Hydrolysis by Chymotrypsin— (Prof. Saul G Cohen and Ezra Khedouri), 75
β-Aminoisobutyric Acid . Urinary Excretion of a Ninhydrin-positive Compound, probably a Peptide, after Administration of, to the Mouse (Dr. James B. Gilbert and Dr. Yuoh Ku), 160
β-Carotene Triiodide Electrical and Magnetic Properties of (Dr Charles M. Huggins and Dr Oliver H. Le Blanc, jun.), 552
β-Chains (*α*- and) of Globins · Separation of the, by means of Starch-gel Electrophoresis (C. J Muller), 643
β-Globulin : A Haemoglobin-binding, in Human Serum (Dr M. P Tombs), 1055
β-Globulin Polymorphism in the Serum Proteins of Pigs : Thread Protein and (G. C. Ashton), 991
β-Globulins in Serum and Milk from Cattle · Inheritance of (Bo Gahne, Jan Rendel and Dr Ole Venge), 907

Between Earth and Space (Dr. Clyde Orr, Jr), *review* by B. R Leaton, 68
Beveridge, G. S. G. : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Bhilawanol : Structure of (Dr. Bernard Loev), 389
Bianchi, P. A., and others Infra-Red Spectra of Deoxyribonucleic Acids from Human Leucocytes, 964
Bibliographical Index of Literature in Russian Language for 1958 (Academy of Sciences of the U S S.R), 359
Bibliography on the Economic and Social Implications of Scientific Research and Development (United States National Science Foundation), 14
Bibliography on Plasma Physics and Magnetohydrodynamics and their Applications to Controlled Thermonuclear Reactions (J D. Ramer), 522
Bibliography (Scientific), of Latin America, 203
Bier, G : Polymeric Progress (The Use of Ziegler Catalysts), 441
Bierrum, N. R., and others : Coherence and Band-width of a Gas Discharge Harmonic Generator, 626
Biersteker, P. A , and others : Intracellular Potentials in Rat Atria during and after Vagal Stimulation or Acetylcholine Administration, 637
Bletti, G. B., and others (edited by) . Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
Bigland, Dr C H., and Triantaphyllopoulos, Dr. D C. · A Re-Evaluation of the Clotting Time of Chicken Blood, 644
Bile (Human) : Seromucoid Contents of (Dr C. Mihaescu and Edith Mihaescu), 394
Billing, Eve · An Association between Capsulation and Phage Sensitivity in *Erwinia amylovora*, 819
Binary Systems in Concentrated Solutions : The Physico-chemical Constants of (Prof. Jean Timmermans), Vol. 1, Two Organic Compounds (without Hydroxyl Derivatives) ; Vol. 2, Two Organic Compounds (at least one a Hydroxyl Derivative), *review* by Dr E. F G. Herington, 918
Bindal, V. N. (Parthasarathy, Dr. S., and) : Ultrasonic Propagation Constants in Supercooled Salol, 145
Binding of a Hepatocarcinogen to the Structural Lipoprotein of Rat Liver—its Bearing on the Immunological Theory of Cancer (J. W. Westrop and Prof. H. N. Green), 350
Binding (Calcium), in Homogenates of Ehrlich Ascites Tumour Cells (R. Schofield and D Thomason), 656
Bindra, Prof. Dalbir : Motivation, *review* by Prof. J. Drever, 39
Binnie, A. M. : Elected a Fellow of the Royal Society, 11
Binomial Distribution : The Meaning of (A. W. F. Edwards), 1074
Biochemical Approach to Pathology (M. J. R. Dawkins and Dr. K R. Rees), *review* by Dr. R. W. R. Baker, 921
Biochemical Data, *review* by Dr. K S. Dodgson, 50
Biochemical Research : Data for (edited by R. M. C. Dawson, Daphne C. Elliott, W. H. Elliott and K. M Jones), *review* by Dr. K. S. Dodgson, 50
Biochemical Society : Symposium No 17 (1958), Glutathione (edited by E. M. Crook), *review*, 669
  Careers in Biochemistry, 854
Biochemical Society and the Societé de Chimie Biologique · Joint Meeting to be held in Paris, 440
Biochemical Studies (Genetical and), of the Immobilization Antigens of *Paramecium aurelia* (J. O. Bishop and Dr G. H. Beale), 734
Biochemical Studies (Histochemical and), of Rat Liver in Experimental Cirrhosis after Partial Hepatectomy (I Bartók, Gy. Domján, E. Horváth and Prof. B. Korpássy), 397
Biochemical and Biophysical Research Communications, Vol. 1, No. 1, 124
Biochemistry : Careers in (Biochemical Society), 854
  General, *review* by Prof. F G. Young, 51
  A Guide-Book to (Kenneth Harrison), *review* by Prof. D. C. Harrison, 583
  Ultracentrifugation in (Dr. Howard K Schachman), *review* by Dr. K. V. Shooter, 56
Biochemistry of the Eye (Dr. Antionette Pirie), 352
Biochemistry in relation to Medicine (C W. Carter, Dr. R. V. Coxon, D. S. Parsons and Prof R H S Thompson), third edition, *review* by Prof. D. C Harrison, 422
Biochemistry and Medicine, *review* by Prof D. C Harrison, 422
Biochemistry and Physiology Comparative, Vol. 1, No. 1, 764
Biochemistry (Microbial) · Annual Ciba Lectures in (Dr. M. R. J. Salton), 284
Biochimie Générale Traité de (M. Javillier, M Polonovski, M Florkin, P. Boulanger, M Lemoigne, J Roche et R. Wurmser), Tome I, Composition Chimique des Organismes, *review* by Prof. F. G. Young, 51
Bio-electric Potentials of Plants (D. S. Fensom), 853
Biographical Memoirs of the National Academy of Sciences of the United States of America, Vol 33, *review*, 70
Biological Activity of Pregnant Mare Serum Gonadotropin : Effect of *p*H on (Bengt H Persson and Stig E J. Melander), 163
Biological Engineering Society : Inauguration of the, 1019
  Election of Officers, 1019
Biological Equilibria in Human Cancer (Dr. Kenneth W. Starr), 1006
Biological Problems of Grafting—a Symposium sponsored by the Commission Administrative du Patrimoine Universitaire de Liège and the Council for International Organizations of Medical Sciences), *review* by Dr. D. M. V. Parrott, 51
Biological Properties (Gibberellin-like) : Distribution and Prevalence of *Fusarium moniliforme* Sheld. (*Gibberella fujikurio* (Saw.) Wr.) producing Substances with (Prof. W. L. Gordon), 698
Biological Rhythm, Society for, and the International Basimetric Society : Seventh International Conference, 604
Biological Sciences : Elementary Statistics with Applications in Medicine and the (Prof. Frederick E. Croxton), *review* by R. M. Cormack, 746
Biological Sciences (Medical and) : Current Indexing and Abstracting Periodicals in the (United Nations, World Health Organization, Library News, Vol. 12, Supp. 2), 936
Biological Significance of Peptide containing Hydroxyproline during the Development of Carrageenin Granuloma (Dr. M. Chvapil and B. Cmuchalová), 806
Biological Standardization of Drugs, 438
Biological and Medical Sciences Statistical Methods in, *review* by R M. Cormack, 746
Biological and Social Aspects : Intraspecific Differentiation— (Dr. Max Pettersson), 431
Biologists (Applied), Association of, and the British Mycological Society Symposium on the Nature and Exploitation of Crop Plant Resistance to Disease, 857
Biology at Oregon, 681
Biology . Arrow Symbol in (Dr. A. E. Needham), 103
  Radiation (Australasian Conference on), 938
  Statistical Methods in (Dr Norman T. J Bailey), *review* by R M. Cormack, 746
  The Teaching of Veterinary Anatomy as a Branch of—its Relationships to Human Anatomy (Dr R. A Green), 192
  Brookhaven Symposia in, No 12, Structure and Function of Genetic Elements (June 1959), *review* by Prof. S. C. Harland, 63
  Brookhaven Symposia in, No. 13, Protein Structure and Function, 361
Biology, Institute of New format of the *Journal*, 282
Biology of Mycorrhiza (Dr J. L. Harley), *review* by Dr J. Warren Wilson, 48
Biology (Experimental), at Rehovoth, 681
Biology (Human), Society for the Study of · Symposium on Human Growth, 19
Biology (Marine), or Oceanography Grants for research in (Challenger Society), 854
Biology (Quantitative) : Cold Spring Harbor Symposia on, Vol. 23, Exchange of Genetic Material—Mechanisms and Consequences, *review* by Prof Kenneth Mather, 832
Biology Building (New), of the University College of Wales, Aberystwyth (Prof T A. Stephenson and Prof P. F. Wareing), 1021
Biology Staining Schedules (R. R. Fowell), sixth edition, 125
Biophysical Journal (Biophysical Society and the Rockefeller Institute Press), 282

British Commonwealth, Association of Universities of the : Report for 1958-59, 600
British Computer : A New, 201
British Computer Society, Ltd. : Second Annual Conference, 361
British Diet : Strontium-90 Content of, 852
British Dyestuffs and Wider Co-operation in Europe, 829
British Flour Millers, Research Association of—New Laboratories (Dr. T. Moran), 856
British Industrialists—Steel and Hosiery, 1850-1950 (Charlotte Erickson), *review* by R. Brightman, 347
British Industries, Federation of : Handbook on the Technical Colleges and their Government, 769
British Industries and their Organization (Prof G. C. Allen), fourth edition, *review* by R Brightman, 70
British Industries Technical Colleges Committee, Joint Federation of : The Technical Colleges and their Government, 769
British Iron and Steel Research Association : Grant of £1,000 to the University of Oxford for the continuation of research on the melting- and freezing-points of alloys, being carried out in the Department of Metallurgy, 126
  Conference on Heat-Treatment Practice, 523
British Leather Manufacturers Research Association : Open Days, 17
  Open Days (Dr. K W. Pepper), 1024
British Library of Political and Economic Science · Annual Report for 1958-59, 520
British Museum (Natural History) : New Exhibits, 14
  Catalogue of the Type Specimens of Microlepidoptera in the, described by Edward Meyrick (J. F. Gates Clarke), Vol 3, Tortricidae, Olethreutidae, Noctuidae, *review* by R. G. Fennah, 188
  The Neolithic Revolution (Sonia Cole), 360
  British Caenozoic Fossils (Tertiary and Quaternary), *review*, 669
British Mycological Society : Applications invited from members, and heads of departments, for grants from the Cheesman and Pethybridge funds to enable students of mycology to attend the Spring or Autumn Foray, or the Plant Pathology Field Meeting, 440
  Presidential Address, Research into Griseofulvin (Dr. P. W. Brian), 853
British Mycological Society (Association of Applied Biologists and the) : Symposium on the Nature and Exploitation of Crop Plant Resistance to Disease, 857
British Occupational Hygiene Society : International Symposium on Inhaled Particles and Vapours, 524
British Rayon Research Association : Open Days, 284
British Science Writers, Association of · Guide to Press Arrangements for Scientific, Medical and Technical Conferences (edited by Ronald Bedford), 437
British Scientific Instrument Research Association : *Instrument Abstracts*, Vol. 15, No. 1, 359, *erratum*, 685
British Scientific Instrument Research Association (Optical Panel) : Optimization Methods used for Optical Design, 17
British Scientist : The Wandering, 436
British Transistorized Computer : A New (General Electric Co., and International Computers and Tabulators, Ltd), 936
British Universities : The Postgraduate Training of Physicists in—the Report of a Joint Committee appointed by the Institute of Physics and the Physical Society, 915
  The Use of Film in Teaching and Research in, 1959 (British Universities Film Council), 444
British Universities Film Council : The Use of Film in Teaching and Research in British Universities (1959), 444
British Veterinary Codex 1953 : 1959 Supplement to, *review* by Dr. P. Jewell, 507
British Veterinary Association : *Research in Veterinary Science*, Vol. 1, No. 1, 16
British Water Research Association : Fourth Annual Report (1958-59), 683
Brittle Materials for Microdiffraction : A Technique for Sampling Oxide Layers and (A M. Adams, M. A. Silva and Veronica M. Spiers), 147
Broadcasting Programmes in Britain, 363
Broadening of the Water Proton Line in High-Resolution Nuclear Magnetic Resonance Spectra of Starch Gels (Dr. Roger Collison and Dr. M. P. McDonald), 548
Brock, Sir Russell . Medicine in Shakespeare's Writings, *review*, 35
Brocklehurst, Dr. W. E. (Austen, Dr. K. F., and) : Inhibition of the Anaphylactic Release of Histamine from Chopped Guinea Pig Lung by Chymotrypsin Substrates and Inhibitors, 866
Brockmann, Prof. Hans : The Actinomycins and their Importance in the Treatment of Tumours in Animals and Man (Chemistry of the Actinomycins), 772
Brombacher, P. J., and others : Swelling of Fresh and Aged Liver Mitochondria as affected by Succinate, Adenine Nucleotides and Thyroxine, 556
Bromelain (Stem) : Liberation of Hexuronic Acid, Hexosamine and Hydroxyproline from Steer Hide by (E. A. Botan and T. B. Brother), 314
Bromide Hydrobromide (S-*β*-aminoethylisothiouronium) . Effect of, on X-Ray Damage to Guinea Pig Skin (Dr. J. B. Walter and Prof. D. Slome), 177
Brompton Hospital Reports : Vol. 27, 1958, *review* by Dr G. Lapage, 507
Brookhaven Symposia in Biology : No 12, Structure and Function of Genetic Elements (June 1959), *review* by Prof. S. C. Harland, 63
  No. 13, Protein Structure and Function, 361
Brooks, Dr. G. T. : Mechanisms of Resistance of the Adult Housefly (*Musca domestica*) to 'Cyclodiene' Insecticides, 96
Brossel, J. : Awarded the Holweck Medal and Prize (given jointly by the Société Française de Physique and the Physical Society), 440
  Optical Detection of Nuclear Magnetic Resonance (Holweck Lecture), 440
Brother, T. B. (Botan, E. A., and) : Liberation of Hexuronic Acid, Hexosamine and Hydroxyproline from Steer Hide by Stem Bromelain, 314
Brotzen, F., and Dinesen, A. : On the Stratigraphy of some Bottom Sections from the Central Pacific (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 4), 609
Brown, Ltd., John, and the Institution of Chemical Engineers : Scholarships in Chemical Engineering, 522
Brown, Prof. R. Hanbury : Elected a Fellow of the Royal Society, 11
Brown, T. D., and Onions, W. J. : Anomalies in the Microscopic Structure of some Wools, 93
Brown, W. : Electromagnetic Radiation from Cylindrical Structures, *review*, 583
Brown University (Office of Ordnance Research of the United States Army and) : Conference on the Mechanisms of Peroxide Reactions, 127
Brucer, Dr. Marshall : Thyroid Radioiodine Uptake Measurement, *review* by Dr E. E Pochin, 424
Bruun, Dr. Anton Frederick : Awarded the Agassiz Medal of the United States National Academy of Sciences, 686 ; work of, 686
Bryan, W. W. : Nitrogen in Tropical Agriculture (The Three Symbioses Legume/Rhizobium, Legume/Grass and Pasture/Herbivore), 942
Bryant, P. M. : Awarded a Ciba Fellowship for 1960-61, 684
Buchan, Dr. S : Rubber to Metal Bonding, second edition, *review* by Dr. W. C Wake, 189
Buchan Prize for 1955-59 of the Royal Meteorological Society awarded to Dr. R J. Murgatroyd, 440
Buckle, Dr. E R. · Reduced Temperatures for Nucleation in Supercooled Liquids, 875
Bulbring, Dr E. · Appointed reader in pharmacology at the University of Oxford, 767
Bulk Conductivity in Organic Crystals (Dr. H Kallmann and Dr. M. Pope), 31
Bulk Growth (Simplified), of *Vibrio foetus* (Dusan Jakovljevic and H. E. R. Beattie), 736
Bull, Frances, and others Mud Fauna of the Stour Estuary, 1018
Buller, A J. : Appointed reader in physiology at King's College, London, 938
Bulletin of the Provisional International Computation Centre, No 8, 764
Bunce, H. M : Awarded the Oliver Bird Prize for 1959, 17
Bunyan, J , and others . Ubiquinones and Ubichromenols in the Rat, 554
  Effect of Thyroxine and 2,4-Dinitrophenol on Levels of Ubiquinone and Ubichromenol in the Rat, 725
Burch, John B. · Chromosomes of *Gyraulus circumstratus*, a Freshwater Snail, 497
Burdon, Dr J., and others : Pentafluoropyridine, 231
Burdon-Jones, C., and McIntyre, A. D. : *Stereobalanus*, a Genus New to the Old World, 491
Bureau Européen de l'Education Populaire Notes et Études, No. 15, European Calendar of Short Summer Courses, 685

Burges, Prof Alan, and Latter, Pamela . Decomposition of Humic Acid by Fungi, 404
Burkhardt, Dr. G H : Appointed lecturer in mathematical physics at the University of Birmingham, 522, 767
Burn, Prof. J. H : Cardiovascular Effects of Nicotine and of Smoking, 525
Burn, Robert A Bivalve Gastropod, 179
Burnet, Sir Macfarlane, and Boyer, Georgiana Loss of Specificity on Passage of Immunologically Competent Cells in the Chick Embryo, 175
Burnham, Mary, and Bock, Fred G . Effect of Molecular Structure upon Concentration of Hydrocarbons in 'Painted' Mouse Skin, 323
Burns, Prof B. Delisle, and Robson, Dr. J. G . 'Weightless' Microelectrodes for Recording Extracellular Unit Action Potentials from the Central Nervous System, 246
Burns, R. H (Bowles, P., and) . *Obituary* of Harold Tongue, 120
Burns, Tom, and Stalker, G. M : Human Problems of Innovation—Based on a Study of some Scottish Firms (Department of Scientific and Industrial Research, Problems of Progress in Industry No 5), 419
Burnstock, G : Membrane Potential Changes associated with Stimulation of Smooth Muscle by Adrenalin, 727
Burr, E J : Earthquakes and Uranus—Misuse of a Statistical Test of Significance, 336
Burri, Prof Conrad Petrochemische Berechnungsmethoden auf Äquivalenter Grundlage, *review* by Prof. K C. Dunham, 56
Bursaries and a Scholarship (Institution of Agricultural Engineers), 284
Burton, D , and Ettlinger, Dr. G. · Cross-Modal Transfer of Training in Monkeys, 1071
Burton, J M C. : Results of the Royal Society's International Geophysical Year Expedition (Nature of the Ice Shelf), 191
Burton, L. K , and others . Detection of Recently Produced Fission Products in the Atmosphere, 223
  Radioactive Fallout during 1959, 925
Burton, W. M , and Stewart, N G. : Use of Long-lived Natural Radioactivity as an Atmospheric Tracer, 584
Bushnell, Dr. G. H. S. Excavations at La Venta, Mexico, 134
  Maya Hieroglyphics, *review*, 580
Business Studies : The Future Development of Management Education and of—Revision of Joint Examination Schemes (Ministry of Education, Circular 1/60), 743
  Management, Education and, 743
Butane Gas (Helium–) Mixtures as Fillings for Geiger-Muller Tubes (Dr V. Moses and Dr. J. F. Fowler), 538
Butler, Prof. J. A. V , and Robins, Dr. A. B. · Effect of Oxygen on the Inactivation of Trypsin by Ionizing Radiation, 697
Butler, Prof. S T , and Messel, Prof H (edited by) From Nucleus to Universe—a Course of Selected Lectures in Physics and Astronomy, University of Sydney, 1960, *review* by G R. Noakes, 748

  Some East Anglian (S Beaufoy), 771
Buxton, Dr E. W : Nature and Exploitation of Crop Plant Resistance to Disease (Studies with Pea Wilt Resistance), 858
Buyske, Donald A. (Hlavka, Dr. Joseph J , and) : Radioactive 7-Iodo-6-Deoxytetracycline in Tumour Tissue, 1064
Buzzard, Dr R B . Awarded the Vernon Prize for 1960 of the National Institute of Industrial Psychology, 938
Buzzard · The (Frank Wenzel), translated from the Danish by Reginald Spink, *review* by Frances Pitt, 65
By-Ways : Geological Ways and, *review* by Dr. J. V. Harrison, 57, 440
Bygdeman, M , and Stjarne, L Effects of 1,4-Dihydrazinophthalazine on the Catechol Amines, 82

CABBAGE (Goitrogenous and Non-goitrogenous) Level of Sulphydryl Compounds in Rat Liver following Feeding with (Jozef Sedlák), 892
Cacace, Fulvio, and Guarino, Angelo : Radiation Labelling with Carbon-14 of Aliphatic Hydrocarbons, 632
Cactaceae · Die (Curt Backeberg), Band 3, Cereoideae (Austrocactinae), *review*, 347
Cadmium : The Radiochemistry of (James R DeVoe), 602
Cadogan, Dr J I G. : Awarded a Meldola Medal for 1959 of the Society of Maccabaeans, 519
Cainozoic Fossils : British (Tertiary and Quaternary), (British Museum (Natural History)), *review*, 669
Caesium-137 in Spray-dried Danish Milk (Per Gert Jensen), 562
Caesium-137 in Toronto Milk during 1959 (Prof. K G McNeill and O. A. D Trojan), 399
Cahn, Dr. R. S. An Introduction to Chemical Nomenclature, *review* by Prof. H. J. Barber, 54
Calcareous Algae in a Sediment Core from the Mindanao Trough Fragments of (H. Horn af Rantzien), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific No. 7), 609
Calcium in Blood Serum : Determination of, by Atomic Absorption Spectroscopy (J. B. Willis), 249
Calcium-47 · International Co-operation and the Production of, 1018
Calcium and Contractility in Depolarized Smooth Muscle (Dr. P. A. Robertson), 316
Calcium and Magnesium in Human Cerebrospinal Fluid (Dr G. Hunter and Honor V. Smith), 161
Calcium Binding in Homogenates of Ehrlich Ascites Tumour Cells (R. Schofield and D Thomason), 656
Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith) Effect of a Sewage Effluent Discharge on the Deposition of (R. W. Edwards and J. Heywood), 492
Calcium Montmorillonite : Swelling of (Dr. A. V. Blackmore and Prof. B. P. Warkentin), 823
Calcium–Montmorillonite with Polymers : Complexes of (W. W Emerson), 573
Calcutt, Dr. G. : Body-Weight and Liver–SH Levels of Mice, 84
Calcutt, Dr G. (Harper, Dr. K. H , and) : Conjugation of 3·4-Benzpyrenols in Mouse Skin, 80
Calder, Ritchie : The Hand of Life—the Story of the Weizmann Institute, *review*, 64
Calendar (European), of Short Summer Courses (Bureau Européen de l'Education Populaire), 685
California Academy of Sciences : Occasional Papers No 25, The Galápagos Islands, a History of their Exploration (Joseph Richard Slevin), 365
California Department of Fish and Game : Bulletin No 107, Trout and Salmon Culture—Hatchery Methods (Earl Leitritz), 204
California Sea-lion, *Zalophus californianus* Chronic Aortitis in the (Dr. Arthur L. Kelly and Dr David Jensen), 731
California Yellow-legged Frog A Blood Parasite from the (Donald L. Lehmann), 765
Callow, Dr. R. K · At the Scientific Publications Council's Discussion on the Rapid Increase in the number of New Scientific Journals, 18
Calne, R. Y Elected to a Harkess Fellowship for 1960 of the Commonwealth Fund, 15
Calorimetry Conference, 604
Calyptraea chinensis (L.) . Response of Larvae of, to Light (H V. Wyatt), 328
Campbell, Dr Allan : Autocatalytic Particles and Steady States, 256
Canada, Geological Survey of : Bulletin No 54, Helicopter Operations of the Geological Survey of Canada, 521
Canada, National Museum of : Natural History Paper No 3, *Anchiceratops* from the Oldman Formation of Alberta (Wann Langston), 522
  Bulletin No 160, Contributions to Botany, 1017
  Bulletin No 162, Contributions to Anthropology, 1017
  Bulletin No. 166, Contributions to Zoology, 1017
Canada, National Research Council of Appointment of Ralph E McBurney as head of the Technical Information Service, 17
  Review (1959), 124
  Scholarships for 1960-61, 854
Canada Council : Second Annual Report (1958-59), 15
Canadian Cancer Conference Vol 3, Proceedings of the Third Canadian Cancer Conference, 1958 (edited by R W. Begg), *review* by Dr. I. Hieger, 1001
Canaline : Chemical Degradation of Canavanine to (Dr H Rinderknecht), 1047
Canavanine to Canaline · Chemical Degradation of (Dr. H. Rinderknecht), 1047
Cancer Binding of a Hepatocarcinogen to the Structural Lipoprotein of Rat Liver—its Bearing on the Immunological Theory of (J. W. Westrop and Prof H. N Green), 350
  Fractionation of Two Metabolically Distinct Classes of Ribonucleic Acids in Animal Cells and its Bearings on (Prof A. Sibatani, K. Yamana, K Kimura and T Takahashi), 215
Cancer Conference : Canadian, Vol 3, Proceedings of the Third Canadian Cancer Conference, 1958 (edited by R W Begg), *review* by Dr I. Heiger, 1001
Cancer Research in the U.S S R., *review* by Dr. P. A. Gorer, 420
Cancer (Human) · Biological Equilibria in (Dr. Kenneth W. Starr), 1006
Cancer (Liver) · Effect of 3-Amino-1,2,4-triazole on the Experimental Production of (Munemitsu Hoshino), 174
Capillary Movement of Nitrate towards Tropical Soil Surfaces (R Wetselaar), 572
Capillary Permeability (Increased), in Injury by Monoamine Oxidase Inhibitors : Suppression of (W G Spector and D A Willoughby), 162
Capsulation and Phage Sensitivity in *Erwinia amylovora* : An Association between (Eve Billing), 819
Carbide (Beryllium) Formation of, during the Corrosion of Beryllium in Carbon Monoxide and in Carbon Dioxide Gas (V. D. Scott), 466
Carbohydrates (Deuterium-labelled) : Infra-red Spectra of (Dr S A. Moore, Prof M Stacey and Dr D. H. Whiffen), 307
Carbon-14 : Enzymic Oxidation of Stilboestrol labelled with (P H Jellinck), 157
  Radiation Labelling with, of Aliphatic Hydrocarbons (Fulvio Cacace and Angelo Guarino), 632
  Radioassay by Gas Chromatography of Compounds labelled with (Dr. Arthur Karmen and Harold R. Tritch), 150
  Scintillation Counting of (David S. Jenkinson), 613
Carbon Dioxide and in Carbon Monoxide Oxidation of Beryllium in (Dr S. J Gregg, Dr R. J. Hussey and Dr. W B Jepson), 468
Carbon Dioxide Gas Formation of Beryllium Carbide during the Corrosion of Beryllium in Carbon Monoxide and in (V. D. Scott), 466
Carbon Monoxide Carbonization of Beryllium in Carbon Dioxide and in (Dr S J. Gregg, Dr R. J. Hussey and Dr W. B. Jepson), 468
Carbon Monoxide and in Carbon Dioxide Gas · Formation of Beryllium Carbide during the Corrosion of Beryllium in (V. D Scott), 466
CO Fourth Positive Band Systems · Interpretation of Intensity Distributions in the N_2 Lyman–Birge–Hopfield and (Prof R. W. Nicholls), 958
Carbonate (Calcium), on Shells of the Snail *Potamopyrgus jenkinsi* (Smith) · Effect of a Sewage Effluent Discharge on the Deposition of (R W. Edwards and J. Heywood), 492
Carbonic Anhydrase : Subnormal Level of, in Blood of Carcinoma Patients ? (Dr N W. H Addink), 253
Carboniferous Rocks of Great Britain : Fossil Plants of the (Dr. Robert Crookall), second edition, *review* by T. M Harris, 66
Carbonized Coals : X-Ray Studies of some (R. Diamond and P. B. Hirsch), 204
Carbons Adsorption of Helium on—Influence on Measurement of Density (Dr F. A. P. Maggs, P. H. Schwabe and J. H. Williams), 956
Carbonyl (Tetraphenyl*cyclo*butadiene Iron) · Crystal Structure of (R. P. Dodge and Dr. V Schomaker), 798
'Carbowax' Systems (Hoagland's) : Freezing-Point Depressions of (Howard G. Applegate), 232
Carboxylic Acid Adsorption to Steel Effect of Moisture on (M. E. Schrader and J. L. Kalinsky), 710
Carcinoma Patients ? : Subnormal Level of Carbonic Anhydrase in Blood of (Dr. N W. H. Addink), 253
Carcinomas (Renal) Ultrastructure of the Clear Cells in, and its Importance for the Demonstration of their Renal Origin (Prof. Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Cardew, Dr. P N. (Hughes, Dr. W H , and) : An Apparatus for Panning in Ciné Micrography, 258
Cardiac Activity in Quantitative Tissue Culture : Effect of Supernatant Potassium-Level on (Prof A W. B Cunningham, K Kleutch and W. Herbst), 241

- Cardiac Neuroses, *review* by Dr. D. C. Deuchar, 423
  - The Chemical Prevention of (Prof. Hans Selye), *review* by Dr. D. C. Deuchar, 423
- Cardioactive Acetone Extracts of Ox Spleen : Absence of Catecholamines in (Dr. L. B. Cobbin and Prof. R. H. Thorp), 473
- Cardiovascular Effects of Nicotine and of Smoking (New York Academy of Sciences Symposium on), 525
- Care of Works of Art : Scientific Methods in the (F. I. G. Rawlins), 437
- Career : Choosing your (Ministry of Labour and National Service, Choice of Careers Series No. 1), 682
- Careers in Biochemistry (Biochemical Society), 854
- *Caretta kempi* Garman on Welsh Coast (Colin Matheson), 989
- Carey, Barbara J. (Skyring, G. W., and) Nitrogen in Tropical Agriculture (Microbial Species involved in Nitrification and Denitrification), 941
- Caribbean Commission, 281
- Caries (Dental), and certain Soil Conditions in New Zealand : An Association between (T. G. Ludwig, W. B. Healy and Capt. F. L. Losee), 695
- Carlsberg–Wellcome Travelling Research Fellowships (Wellcome Trust), 283
- Carman, P. C. (Miller, L., and) : Analogy to the Kirkendall Effect in the Gas Phase, 549
- Carnegie Institution of Washington : Publication No. 617, Miocene Floras of the Columbia Plateau, Part 1, Composition and Interpretation (Ralph W. Chaney) ; Part 2, Systematic Considerations (Ralph W. Chaney and Daniel I. Axelrod), *review* by Prof. J. Walton, 66
  - Year Book No. 58 (1958-59), 207
- Carnegie Silver Medal for 1959 of the Iron and Steel Institute awarded to Dr. P. R. V. Evans, 13
- Carnegie Trust for the Universities of Scotland : Fifty-eighth Annual Report (1958-59), 359
- Carotene : Effect of Diphenylamine on the Synthesis of (Gy. Schneider, Dr. B. Matkovics, J. Zsolt and Ö. Kovács), 235
- β-Carotene Triiodide : Electrical and Magnetic Properties of (Dr. Charles M. Huggins and Dr. Oliver H LeBlanc, jun), 552
- Carr, J. G., and Shimwell, J. L. : Pigment-producing Strains of *Acetobacter aceti*, 331
- Carrangeenin Granuloma · Biological Significance of Peptide containing Hydroxyproline during the Development of (Dr. M Chvapil and B. Cmuchalová), 806
- Carrier Gas · Effect of, on the Sensitivity of Thermal Conductivity Detectors (C. Bokhoven and A. Dijkstra), 793
- Carslaw, Prof. H S., and Jaeger, Prof. J C. : Conduction of Heat in Solids, second edition, *review* by Prof L. S. Goddard, 421
- Carson, John F., and others : A Rapid Method for Qualitative Analysis of Volatile Mercaptan Mixtures, 801
- Carter, Dr. C. O. · Chromosome Abnormalities in Man, 683
- Carter, C W., and others : Biochemistry in relation to Medicine, third edition, *review* by Prof D. C. Harrison, 422
- Carter, E. B. · Promoted to Deputy Chief Scientific Officer and appointed director of engine production at the Ministry of Aviation, 518 ; work of, 518
- Cartledge, Dr. G. H. : Significance of the 'Equivalent Redox Potential' in Aqueous Solutions under Ionizing Radiation, 370
- Cartmill, W. J. : Nitrogen in Tropical Agriculture (Nitrogen Fertilizing of Cotton), 942
- Cartwright, W. F : Elected president for 1960-61 of the Iron and Steel Institute, 13
- Casey, Lord : Appointed a member of the Executive of the Australian Commonwealth Scientific and Industrial Research Organization, 12
- Casley-Smith, J R. : Elected to a Beit Memorial Junior Fellowship for Medical Research, 520
- Cassels, Prof J. M : Appointed to the Lyon Jones chair of physics at the University of Liverpool, 201 ; work of, 201
- Cassie, Vivienne : A Red Water Bloom of Rotifers in Cook Strait, New Zealand, 328
- Castle and Sample Holder for Radioactive Counting : An Inexpensive (Dr. Howard Boroughs), 145
- Castner Memorial Lecture of the Society of Chemical Industry (Dr. W. J. Kroll), 685
- *Casuarina cunninghamiana* : Haemoglobin in the Root Nodules of (Dr. H E. Davenport), 653
- Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick (J. F. Gates Clarke), Vol. 3, Tortricidae, Olethreutidae, Noctuidae, *review* by R. G. Fennah, 188
- Catalogue Cards : The Reproduction of (Philip S Pargeter), 1020
- Catalysis : Second Congress on, 523
- Catalysis (Vanadium), of the Oxidation of Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles (Dr G. M Martin, E. P. Benditt and N. Eriksen), 884
- Catalysts (Silica–Alumina) : Infra-Red Spectra of Ammonia adsorbed on (D. E Nicholson), 630
- Catalytic Effects in the Alkaline Oxidation of Cellulose (Dr. W. A. Bell), 963
- Catecholamines : Absence of, in Cardioactive Acetone Extracts of Ox Spleen (Dr. L. B Cobbin and Prof R. H. Thorp), 473
  - Effects of 1,4-Dihydrazinophthalazine on the (M. Bygdeman and L. Stjarne), 82
- Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles : Vanadium Catalysis of the Oxidation of (Dr. G. M. Martin, E. P. Benditt and N Eriksen), 884
- Cathode Surface Roughness and Oxidation · Effect of, on Arc Movement (Dr. T. J. Lewis and Dr. P. E. Secker), 30
- Cattle : Artificial Insemination in, *review* by Sir John Hammond, 667
  - Inheritance of β-Globulins in Serum and Milk from (Bo Gahne, Jan Rendel and Dr. Ole Venge), 907

  - Structure and Growth of Plant, *review* by Prof R. D. Preston, 920
- Cell-stimulating Hormone (Interstitial) : Histophotometrical Study of the Effect of, on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat (S. L. Liu), 475
- Cells : Fuel—Will they soon Become a Major Source of Electrical Energy ? (F. T Bacon), 589
  - Structures corresponding to Terminal Bars and Terminal Web in Many Types of (Prof C P. Leblond, Holde Puchtler and Y. Clermont), 784
- Cells—Normal and Abnormal : Chemical Organization of (Conference at the University of Wisconsin), 604
- Cells (Animal) : Fractionation of Two Metabolically Distinct Classes of Ribonucleic Acids in, and its Bearings on Cancer (Prof. A. Sibatani, K. Yamana, K. Kimura and T. Takahashi), 215
- Cells (Clear), in Renal Carcinomas . Ultrastructure of the, and its Importance for the Demonstration of their Renal Origin (Prof Ch Oberling, M. Rivière and Fr. Haguenau), 402
- Cells (Ectromelia Virus-infected) : Filamentous Structures in (Dr. Benjamin V Siegel), 820
- Cells (Ehrlich Ascites Tumour) : Calcium Binding in Homogenates of (R. Schofield and D Thomason), 656
- Cells (Human), in Tissue Culture : Effect of Oxygen and Nitric Oxide on the Radiosensitivity of (Dr. D. L Dewey), 780
- Cells (Immunologically Competent), in the Chick Embryo : Loss of Specificity on Passage of (Sir Macfarlane Burnet and Georgiana Boyer), 175
- Cells (Intact) : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the Enzyme Status in (Prof S Rapoport and D. Scheuch), 967
- Cells (Isolated Mammalian) Are Macromolecules required for Growth of Single? (Ralph B Gwatkin), 984
- Cells (Lipophilic Agar) : Diffusion of Proteins through (Dr. Ch. Wunderly), 885
- Cells (Mast) · Antigen-induced Damage to Isolated Sensitized (Dr. I. Mota and W. Dias da Silva), 245
- Cells (Mouse Sarcoma 37) : Changes in the Deoxyribonucleic Acid Content of, following Serial Irradiation (Dr. A E. G. Pearson and N. B. Atkin), 647
- Cells (Plant) · Life-like Preservation of Cytoplasmic Detail in (Dr. J. Chayen, Prof G. J Cunningham, P. B. Gahan and A A. Silcox), 1068
- Cells (Rat Pineal Parenchymal) : Effects of Injection of Bovine Pineal Extract on the Nuclei of (Dr. Uno Holmgren, Dr. Mark D. Altschule and Dr Richard J. Wurtman), 393
- Cells (Red Blood), of East Africans : Glucose-6-Phosphate Dehydrogenase Deficient in (Dr. A. C. Allison), 531
- Cells (Sense) : Selective Elimination of Single, with Methylene Blue (Dr. Ulrich Clever), 812
- Cells (Single), of Mouse Parotid Tumours : Virus Release from (Dr. Mathilde Krim and Dr Leo Sachs), 262
- Cells (White) and Platelets · Micro-electrophoresis of Human (Dr. William P. Creger and Phyllis Menna Thomas), 171
- Cellular Proteins : Ribonucleic Acids and the Synthesis of (Prof. J. Brachet), 194
- Cellulose : Catalytic Effects in the Alkaline Oxidation of (Dr. W. A. Bell), 963
- CENTO Institute of Nuclear Science in Tehran (H. A. C. McKay), 513
  - Symposium on Recent Developments in the Applications of Nuclear Science for Peaceful Purposes, 685
- Central Advisory Water Committee · Final Report of the Trade Effluents Sub-Committee (Ministry of Housing and Local Government), 210
- Central African Savannahs, *review* by J P. M. Brenan, 505
- Central Botanical Laboratory, Allahabad : Retirement of Dr. E. K. Janaki Ammal from the directorship, 519
  - Appointment of Dr. G. S. Puri as director, 519
- Central Nervous System : 'Weightless' Micro-electrodes for Recording Extracellular Unit Action Potentials from the (Prof. B. Delisle Burns and Dr. J. G. Robson), 246

Central Institute for Scientific Cinematography, 444
Centre of Metabolic Activity : Neurokeratin Network of the Peripheral Nerve Fibre Myelin Sheath as a (Dr. H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Centrifugation . Effect of, on the Macronucleus of *Spirostomum* and *Blepharisma* (Prof. B. R. Seshachar), 333
Centriole (Proximal), in Flagellate Spermatozoa : Position of the (Prof. Vishwa Nath, Brij L. Gupta and L. C. Mittal), 899 , (Dr. J. Bronte Gatenby and R S. Mathur), 900
Centro Brasileiro de Pesquisas Fisicas : Latin American School of Physics, 361
Cephalin : Interaction between Albumin, Lecithin and (Dr. Eric Ponder and Ruth V. Ponder), 235
Cerebrospinal Fluid (Human) : Calcium and Magnesium in (Dr. G. Hunter and Honor V. Smith), 161
Cerebrospinal Fluids (Human) 5-Hydroxyindoles in (G W Ashcroft and D. F. Sharman), 1050
CERN—*see under* European Organization for Nuclear Research
Cervical Sympathectomy and Pituitary Stalk Section · Influence of, upon Milk Secretion in Goats (G. B. Tverskoy), 782
Cessation of Treatment with Diethylstilboestrol : Duration of Stimulation of Phagocytic Activity of the Reticulo-Endothelial System after (C. C. Ware and Prof T Nicol), 974
Chadderton, Lewis T. : Electron Microscopy and the Crystal Structure of Indanthrene, 541
Chadwick, C. S., and others Depolarization of the Fluorescence of Proteins labelled with various Fluorescent Dyes, 239
Chains (α- and β-) of Globins : Separation of the, by means of Starch-gel Electrophoresis (C. J. Muller), 643
Chakravarti, D., and others : Smilagenone and *Epi*-Smilagenin from *Dioscorea* Saponin, 236
Chakravarti, Prof. R. N., and others : Smilagenone and *Epi*-Smilagenin from *Dioscorea* Saponin, 236
Challenger, Prof. Frederick : Apsects of the Organic Chemistry of Sulphur, *review* by Dr F. G. Mann, 53
Challenger Society . Grants for research in Marine Biology or Oceanography, 854
Challenger Society and representatives from the Marine Laboratories (Development Commissioners Scheme) : Joint Meeting in Cambridge, 685, 938
Chalmers, Dr. Bruce, and King, Dr. R (edited by) : Progress in Metal Physics, Vol. 7 (1958), Vol. 8 (1959), *review* by Prof. F. C. Thompson, 666
Chamberlain, Prof. O : Elected a member of the United States National Academy of Sciences, 773
Chambers, Prof. Kenton L. : Appointed associate professor and curator of the Herbarium in Oregon State College, 1020
Chambers, Rosalind (Barbara Wootton, assisted by Vera G. Seal and) : Social Science and Social Pathology, *review* by Prof. E. Stengel, 41
Chambers, Dr R. D. Appointed lecturer in chemistry at the University of Durham, 937
Champeney, Dr. D C. : Appointed lecturer in physics at the University of Birmingham, 522, 767
Champion, Sir Harry . *Obituary* of Prof. E. P. Stebbing, 515
Chaney, Ralph W. : Miocene Floras of the Columbia Plateau, Part 1, Composition and Interpretation, *review* by Prof. J. Walton, 66
Chaney, Ralph W., and Axelrod, Daniel I. · Miocene Floras of the Columbia Plateau, Part 2, Systematic Considerations, *review* by Prof. J. Walton, 66
Change in African Cultures : Continuity and (edited by William R. Bascon and Melville J. Herskovits), *review* by G. W. B Huntingford, 38
Change (Colour), in Amphibians : Control of (C. Barker Jørgensen and Lis Olesen Larsen), 641
Changes in the Deoxyribonucleic Acid Content of Mouse Sarcoma 37 Cells following Serial Irradiation (Dr. A E G. Pearson and N B. Atkin), 647
Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by Protein Administration (Dr Catherine M. Clark, Dr G. A. J. Goodlad, Dr J Chisholm and Dr H N. Munro), 719
Changes in Structure of a Periclinal Chromosomal Chimera of Apple following X-Irradiation (Charlotte Pratt), 255
Changes in the Suffolk Flora during the Past 100 Years (F. W. Simpson), 771
Changes (Age), in Performance : Construct 'Reactive Inhibition' in the Interpretation of (Dr S. Griew and Dr R Lynn), 182
Changes (Heritable), in Lactic Streptococci induced by Physical Treatments (B. S. Gossling), 868
Changes (Membrane Potential), associated with Stimulation of Smooth Muscle by Adrenalin (G. Burnstock), 727
Changes (Postural), in Chlorpromazine Hypothermia (Dr D. Svorad), 240
Changes (Radiation-induced), in α-Lead Azide (G Todd and E Perry), 543
Changes (Small Rapid Volume), in a Muscle during Activity Determination of (Prof. B. C. Abbott and R J Baskin), 1055
Changes (Temperature), in the Antarctic Atmosphere (Dr. H. Wexler), 445
Channey, P V. · Recent Advances in Coconut Research in India, 861
Chapman, Victor, and others Position of the Gene determining the Diploid-like Meiotic Behaviour of Wheat, 259
Characteristics (Driver) · Traffic Accidents and (Sauli Hakkinen), 273
Characterization of a New Purine Riboside isolated from *Fusarium* Species (Dr Alessandro Ballio, Dr. Carlo Delfini and Dr. Serena Russi), 968
Characterizing *Pseudomonas solanacearum* . A Method for (A. C. Hayward), 405
Charge Transfer : Detection of Negative Ions formed by (T. M Donahue and F. Hushfar), 1038
Charges of the Electron, Proton and Neutron Comparison of the (A. M Hillas and T. E. Cranshaw), 459
Charlson, Dr. A. J. : Appointed an I.C.I. Research Fellow in the University of Edinburgh, 767
Chatt, E. M. : Minor Elements in Nutrition (Adventitious Metals in Processed Foods), 940
Chaudhury, Prof Ranjit Roy, and Dikshit, Mandakini B. : Milk-ejecting Action of Ergot, 722
Chayen, Dr. J., and others : Life-like Preservation of Cytoplasmic Detail in Plant Cells, 1068
Chemical Analyses of Rocks, *review* by Prof. K. C Dunham, 56
Chemical Constants (Physical and) Tables of, and some Mathematical Functions (Dr. G W. C Kaye and Dr. T. H Laby), twelfth edition, *review* by T. M. Yarwood, 67
Chemical Degradation of Canavanine to Canaline (Dr. H. Rinderknecht), 1047
Chemical Effects of Ionizing Radiation on Deoxyribonucleic Acid in Dilute Aqueous Solution (G. Hems), 710
Chemical Engineering at Birmingham, 849
Chemical Engineering at Nottingham, 933
Chemical Engineering : Education and Training in (Supplement to Chemical Engineering, a Career), (Institution of Chemical Engineers), 125
  Scholarships in (John Brown, Ltd , and the Institution of Chemical Engineers), 522
Chemical Engineers, Institution of : Education and Training in Chemical Engineering (Supplement to Chemical Engineering, a Career), 125
Chemical Engineers, Institution of (John Brown, Ltd , and the) : Scholarships in Chemical Engineering, 522
Chemical Industry, Society of · Appointment of Dr. W. J. Kroll as the sixth Castner Memorial Lecturer, 685
  Castner Memorial Lecture, The Fusion Electrolysis of Titanium (Dr. W J. Kroll), 685
Chemical Industry, Society of (Microbiology Group), (Society for Applied Bacteriology and the) : Symposium on Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds, 131, *erratum*, 206
Chemical Industry, Society of, and others : Symposium on the Industrial Chemistry of the Lower Olefines, 285
Chemical Nomenclature, *review* by Prof H J Barber, 54
  An Introduction to (Dr. R. S. Cahn), *review* by Prof. H. J. Barber, 54
Chemical Organization of Cells, Normal and Abnormal (Conference at the University of Wisconsin), 604
Chemical Prevention of Cardiac Neuroses (Prof. Hans Selye), *review* by Dr D. C. Deuchar, 423
Chemical Process Principles (Prof. Olaf A. Hougen, Prof. Kenneth M. Watson and Prof. Roland A. Ragatz), Part 2, Thermodynamics, second edition, *review* by L. E. Marc de Chazal, 1003
Chemical Society, in co-operation with the Department of Scientific and Industrial Research : To issue a translation of the *Russian Journal of Physical Chemistry*, 601
Chemical Society, and others · Symposium on the Industrial Chemistry of the Lower Olefines, 285
Chemical Society (American) . Scientific Russian without Tears (Prof. J. W. Perry), 359
Chemical Thermodynamics, *review* by Prof. A. R Ubbelohde, 55
  An Introduction to the Study of (Prof. D H. Everett), *review* by Prof. A. R. Ubbelohde, 55
Chemische Reaktionen Ionisierender Strahlen (Radiation Chemistry), (herausgegeben von Prof. Hermann Mohler), *review* by Prof. F. S. Dainton, 344
Chemist · A Structural Tool for the, *review* by Prof. E. R Andrew, 55
Chemistry at Aberystwyth, 680
Chemistry at Queen Mary College, London, 762
Chemistry Robert Boyle—Father of (Dr. Roger Pilkington), *review* by Dr W. A. Smeaton, 63
  Status and Development of the Teaching of (Organization for European Economic Co-operation Seminar on the), 208
  Steroid, *review* by Dr. W Klyne, 668
Chemistry, Royal Institute of : Lectures, Monographs and Reports, 1959, No 5, Modern Explosives (the late Dr. Wilfrid Taylor), 204
  Monographs for Teachers No. 3, Principles of the Extraction of Metals (Dr. D J. G Ives), 765
Chemistry, Royal Institute of, and others : Symposium on the Industrial Chemistry of the Lower Olefines, 285
Chemistry and Applications Co-ordination Compounds, their (Department of Chemical Technology of the Bradford Institute of Technology Symposium on), 440
Chemistry (Analytical), of Polymers (edited by Gordon M Kline), Part 1, Analysis of Monomers and Polymeric Materials—Plastics, Resins, Rubbers, Fibres, *review* by Prof. C. E. H Bawn, 52
Chemistry (Electroanalytical), Journal of, 124
Chemistry (Industrial), of the Lower Olefines (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 285
Chemistry (Organic), in the University of New South Wales, 357
Chemistry (Organic) : Nuclear Magnetic Resonance—Applications to (Prof. J. D Roberts), *review* by Prof E. R. Andrew, 55
  Principles of (T. A Geissman), now available in England, 17
Chemistry (Organic), of Sulphur, *review* by Dr F G. Mann, 53
  Aspects of the (Prof Frederick Challenger), *review* by Dr F. G. Mann, 53
Chemistry (Osseous), in Lathyritic Rats · Aortic, Serum, Connective Tissue and (Dr. R. A. Grant, M. Hathorn and Prof. Theodore Gillman), 164
Chemistry (Physical), Russian Journal of A translation to be issued by the Chemical Society in co-operation with the Department of Scientific and Industrial Research, 601
Chemistry (Physics and) of Glass, Vol. 1, No 1 (Society of Glass Technology), 601
Chemistry (Radiation) : Applied, *review* by Prof F. S. Dainton, 344
Chemistry (Superficial), and Solid Imperfections (Prof. F C. Tompkins), 3
Chemists, British Association of : Hinchley Medal awarded to Dr C. J. T. Cronshaw, 685
Cherry, Prof Colin ˙ The Measurement of Information, *review*, 506
Cherts (Mohgaonkalan) A New Specimen of *Nipa* Fruit from (Dr. S D. Chitaley), 495
Chester, C. E. : *Obituary* of Prof. H. Stansfield, 517

Children (Gifted) : Psychology of (Dr W D Wall), 692
Children (Nigerian) . Sickle-Cell Anaemia in (R G. Hendrickse), 1027
Chilton, D : Appointed keeper of the Department of Electrical Engineering and Communications in the Science Museum, London, 206
Chimera (Periclinal Chromosomal), of Apple . Changes in Structure of a, following X-irradiation (Charlotte Pratt), 255
Chimie Biologique, Société de (Biochemical Society and the) : Joint Meeting to be held in Paris, 440
Chimie Physique, Société de : Conference on the Structure of Graphite and the Kinetics of its Reactions, 284
Chimique (Composition), des Organismes (Traité de Biochimie Générale, par M Javillier, M. Polonovski, M. Florkin, P. Boulanger, M. Lemoigne, J Roche et R. Wurmser, Tome I), *review* by Prof. F. G. Young, 51
Chimique (Thermodynamique) : Bases Fondamentales et Applications de la (Prof. Maurice Dodé), Tome I, Les Principes, les Systèmes ideaux Gazeux, et avec Phases Condensées pures, *review* by Prof. A. R. Ubbelohde, 55
Chin, Y Ch., and others : Antimalarial Properties of some Guanidine Derivatives, 170
China : Early Science in, *review* by Prof W. M. Smart, 36
  Science and Civilization in (Dr. Joseph Needham, with the collaboration of Dr. Wang Ling), Vol 3, Mathematics and the Sciences of the Heavens and the Earth, *review* by Prof. W. M. Smart, 36
China (Medieval) Horology in, *review* by Dr F. A B Ward, 834
Chippendale, F : Nitrogen in Tropical Agriculture (Nitrogen Fertilizing of Tobacco and Horticultural Crops), 942
Chisholm, Dr J , and others : Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by Protein Administration, 719
Chitaley, Dr. S. D : A New Specimen of *Nipa* Fruit from Mohgaonkalan Cherts, 495
Chloramphenicol : Effects of, on the Recovery of Ultra-violet-irradiated *Escherichia coli B* (H. Okagaki and Prof A. Sibatani), 818
Chlorella ellipsoidea . A New Copper Protein from (Dr. Sakae Katoh), 533
Chloride (Aluminium) (Benzyl Chloride–) . Alkylation of Coal by (M. S. Iyengar, D. D. Banerjee and D. K. Banerjee), 387
Chloride (Barium) . Micromosaic Patterns in Single Crystals of Potassium Chloride containing (J. Ewles and J. B. Dawson), 381
Chloride (Benzyl)–Aluminium Chloride · Alkylation of Coal by (M. S. Iyengar, D D Banerjee and D K. Banerjee), 387
Chloride (Potassium), (Single Crystals of), containing Barium Chloride : Micromosaic Patterns in (J. Ewles and J B. Dawson), 381
Chlorite–Vermiculite Mineral : A Regular Mixed-Layer (Dr. M. Nakahira and S. Sugiura), 877
Chlorophyll Role of the Triplet State in the Photoreduction of (Prof. Robert Livingston and Dr. A C P. Pugh), 969
Chlorophyll Content of Gibberellin-treated Wheat Seedlings (Prof. Frederick T. Wolf and Dr Alan H. Haber), 217
Chloroplasts : Function of the Two Cytochrome Components in—a Working Hypothesis (Dr R Hill and Dr. Fay Bendall), 136
Chloroplasts (Isolated Spinach) : Induction Phenomena in Photosynthesis of (Dr Knud Vejlby), 652
Chlorpromazine Hypothermia : Postural Changes in (Dr. D Svorad), 240
Cholesterol (Prof. David Kritchevsky), *review* by Dr. D. T Elmore, 745
Cholesterol and Lecithin (Cortisone Acetate,) : Enhancement of Staphylococcal Virulence for Mice by Intraperitoneal (Dr. Daniel Amsterdam and Dr. S. Stanley Schneierson), 101
Chondrites (Enstatite) · Silicon in the Metal Phase of (A. E. Ringwood), 465
Chondritic Meteorites : Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in (Dr. R A. Schmitt, A. W. Mosen, C. S. Suffredini, J. E Lasch, Dr R. A. Sharp and D. A Olehy), 863
  Origin of Chondrules and (Dr. Brian Mason), 230
Chondroitin Sulphates (Isomeric) : Identification of (J B. Adams), 555
Chondrules and Chondritic Meteroites : Origin of (Dr Brian Mason), 230
Choosing your Career (Ministry of Labour and National Service, Choice of Careers Series No I), 682
Chopped Guinea Pig Lung : Inhibition of the Anaphylactic Release of Histamine from, by Chymotrypsin Substrates and Inhibitors (Dr. K F Austen and Dr W E Brocklehurst), 866
Chorioallantoic Membrane of the Chick Culture of Human Leucocytes on the (Eugene Bell), 403
Chorion-epitheliomatous Tumour in the Rat Induction of a (R. Stein-Werblowsky), 980
Christensen, Dr. G. N : Visco-Elastic Systems (Effect of Rheological Properties on Sorption), 943
Christopherson, Prof D. G : Elected a Fellow of the Royal Society, 11
  Appointed Warden of the Durham Colleges, 604
Chromactivating Hormones in the Pituitary of the Minnow : Distribution of (A. K. Kent), 395
Chromatograms (Paper) : Specific Detection of Glucose on (Dr. M. R. J. Salton), 966
Chromatograph · A Micro Gas (Prof. Nobuji Sasaki, Kimimichi Tominaga and Masaya Aoyagi), 309
Chromatographic (Gas) Fractions : Microquantitative Infra-Red Analysis—Application to (J. E. Stewart, R O. Brace, T. Johns and W. F. Ulrich), 628
Chromatography : Gas (Gas Chromatography Discussion Group of the Institute of Petroleum Hydrocarbon Research Group Symposium on), 127, 943
  Paper—Multiple Spot Formation by Pure Substances (Dr. A. H. Beckett, M A. Beaven and Dr Ann E Robinson), 775
Chromatography (Gas) : Analysis of Anaesthetic Mixtures by (E. R. Adlard and D. W Hill), 1045
  Radioassay by, of Compounds labelled with Carbon-14 (Dr. Arthur Karmen and Harold R. Tritch), 150
  Sterol Analysis by (R. K Beerthuis and J H. Recourt), 372
Chromatography (Gas–Liquid) : Non-Equilibrium Theory of (Dr M. A. Khan), 800
Chromosomal Chimera (Periclinal), of Apple · Changes in Structure of a, following X-Irradiation (Charlotte Pratt), 255
Chromosomal Deviants . Triploid Rat Embryos and other, after Colchicine Treatment and Polyspermy (L Piko and O. Bomsel-Helmreich), 737
Chromosome Abnormalities in Man (Dr. C. O. Carter), 683
Chromosome Numbers of Four Species of the Genus *Dendrocoelum* Œrsted (*Turbellaria tricladida paludicola*), (Dr. Anders G Dahm), 334
Chromosome Numbers of Slugs (Gillian E. Beeson), 257

Clarke, J. F. Gates : Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick, Vol. 3, Tortricidae, Olethreutidae, Noctuidae, *review* by R. G. Fennah, 188
Clarke, Dr. K. U., and Grenville, H. : Nervous Control of Movements in the Foregut of *Schistocerca gregaria* Forsk., 98
Class (A New), of Hormonally Active Steroids (Dr. E. H. Reerink, H. F. L. Scholer, P Westerhof, A. Querido, A. A. H. Kassenaar, E. Diczfalusy and K. C. Tillinger), 168
Class (A New), of Type-Specific Glycolipids of *Mycobacteria* : Mycosides, a (Donald W. Smith, H. M. Randall, A. P. MacLennan and E. Lederer), 887
Classification of the Aradidae (*Hemiptera-Heteroptera*), (Prof. Robert L. Usinger and Ryuichi Matsuda), *review* by R. G. Fennah, 46
Classification of Elements : Periodic (W. P Thistlethwaite), 153 ; (L. M. Simmons), 154 ; (A. A. Clifford), 154
Classification and Indexing in Science (B. C. Vickery and D. J. Foskett), second edition, *review* by R. Brightman, 190
Clathrate Compounds (New), of the Inert Gases (J. G. Waller), 429
Cleaning of Fossils by Ultrasonic Waves (J. N. M. Firth), 684
Cleaning (Dry) : Solvents and, 764
Clear Cells in Renal Carcinomas : Ultrastructure of the, and its Importance for the Demonstration of their Renal Origin (Prof. Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Clearance Rates of Sodium-24 ,Potassium-42 and Iodine-131 in Normal Dog Hip Joints (Prof. Patrick G Laing and Dr. Ik Dong Kim), 898
Clermont, Y., and others : Structures corresponding to Terminal Bars and Terminal Web in Many Types of Cells, 784
Clever, Dr. Ulrich : Selective Elimination of Single Sense Cells with Methylene Blue, 812
Clifford, A A. : Periodic Classification of Elements, 154
Clifton, Charles E., and others (edited by) : Annual Review of Microbiology, Vol. 13, *review* by Dr. B. A Newton, 49
Clock (Atomic) : Preliminary Flight Tests of an, in Preparation of Long-range Clock Synchronization Experiments (Friedrich H Reder and Gernot M. R Winkler), 592
Clock Synchronization Experiments (Long-range) : Preliminary Flight Tests of an Atomic Clock in Preparation of (Friedrich H. Reder and Gernot M. R. Winkler), 592
Clockwork : Heavenly—the Great Astronomical Clocks of Medieval China (Dr. Joseph Needham, Dr. Wang Ling and Dr Derek J. de Solla Price), *review* by Dr F. A. B. Ward, 834
Clones of *Hevea brasiliensis* : Developments in the Propagation of, by Cuttings (G H. Tinley and R. J. Garner), 407
Clotting : Initiation of, in Normal and Hageman Plasma by Glass (Dr. Preben Ollendorff), 173
Clotting Time of Chicken Blood : A Re-Evaluation of the (Dr. C. H. Bigland and Dr. D. C. Triantophyllopoulos), 644
Club Alpin Sous-Marin : International Colloquium on Sub-aquatic Medicine, 440
Clusters : Globular (Dr. T. D Kinman), 608
Cmuchalová, B. (Chvapil, Dr. M , and) : Biological Significance of Peptide containing Hydroxyproline during the Development of Carrageenin Granuloma, 806
Coagulation (Blood), in a Cold- and a Warm-blooded Animal : Influence of Temperature upon (Dr. H B Anstall and Dr. R. G. Huntsman), 726
Coal : Alkylation of, by Benzyl Chloride–Aluminium Chloride (M. S. Iyengar, D. D. Banerjee and D. K. Banerjee), 387
Coal Board, National : Grant of £1,600 to the University of Oxford, for the continuation of research on hot and humid conditions, being carried out in the Department of Human Anatomy, 126
Coal Vitrains in the Visible and Ultra-Violet : Reflectance of, compared with that of Graphite (L. A. Gilbert), 143
Coaldrake, J. E. : Nitrogen in Tropical Agriculture (Slower Turnover of Nitrogen in Natural Communities compared with Pastures), 941
Coals (Carbonized) : X-Ray Studies of some (R. Diamond and P. B. Hirsch), 204
Coals (High-Rank) : Structures of, deduced from Helium Densities (T. S. Polansky, H. J. Donald and Prof. C. R Kinney), 792
Coast (Welsh) : *Caretta kempi* Garman on (Colin Matheson), 989
Coast (West) of Scotland : Occurrence of *Falkenbergia rufolanosa* on the (Dr. Elsie Conway), 566
Coates, Dr. J H , and others : A New Type of Autoxidation Reaction—Flavin Dissociation and Inactivation of Cytochrome b_5 by Oxygen, 1033
Cobalt in Nitrogen Fixation by a Legume (Prof. H. M. Reisenauer), 375
Cobbin, Dr. L. B., and Thorp, Prof R. H : Absence of Catecholamines in Cardioactive Acetone Extracts of Ox Spleen, 473
Cockayne, B. : Appointed William Gibbins Research Fellow in the Department of Physical Metallurgy in the University of Birmingham, 937
Cockcroft, Sir John : Elected president of the Institute of Physics and the Physical Society, 681
Coconut Committee, Indian Central : Conference on Recent Advances in Coconut Research in India, 860
Coconut Research in India : Recent Advances in (Indian Central Coconut Committee Conference on), 860
Codes (Error-correcting Group) : A Systematic Method for the Construction of (Prof. R. B. Banerji), 627
Coelenterates : 5-Hydroxytryptamine in (Prof J. H. Welsh), 811
Coenzyme A Content of Adipose Tissue (Marilyn M. Thompson and Prof. Jean Mayer), 640
Coenzyme I : Non-Enzymic Reactions of Indoles with (Prof. S. G. A. Allivisatos, G. A Mourkides and A. Jibril), 718
Cogito ergo sum, *review* by Dr. A. D. Booth, 422
Cohen, Dr. Jerome (Veis, Dr. Arthur, and) : Reversible Transformation of Gelatin to the Collagen Structure, 720
Cohen, Prof. Morris R , and Drabkin, Dr. I. E. : A Source Book in Greek Science, second printing, with corrections, *review*, 63
Cohen, Prof Saul G., and Khedouri, Ezra : Requirements for Stereospecificity in Hydrolysis by Chymotrypsin—Diethyl β-Acetamidoglutarate, 75
Coherence and Band-width of a Gas Discharge Harmonic Generator (N. R. Bierrum, D. Walsh and J. C. Vokes), 626
Coherence Properties of Electromagnetic Radiation (United States Air Force, the Optical Society of America and the University of Rochester Conference on), 127
Coid, Dr. C. R. : Monkeys and Disease, *review*, 506
Coke Research Association (British) : Grant of £3,500 to the Houldsworth School of Applied Science in the University of Leeds, 767
Colchicine : Biosynthesis of (Dr. A. I Scott), 556
Colchicine Treatment and Polyspermy : Triploid Rat Embryos and other Chromosomal Deviants after (L. Piko and O Bomsel-Helmreich), 737
Cold Box : A Commercial Thermoelectric (General Electric Co., Ltd.), 439
Cold- and a Warm-blooded Animal : Influence of Temperature upon Blood Coagulation in a (Dr H. B Anstall and Dr R. G. Huntsman), 726
Cold Spring Harbor Symposia on Quantitative Biology : Vol. 23, Exchange of Genetic Material—Mechanisms and Consequences, *review* by Prof. Kenneth Mather, 832
Cole, Dr G. H. A. : The Liquid Friction Constant, 301
Cole, K. D. : Solar Terrestrial Relationships, 874
Cole, Sonia : The Neolithic Revolution, 360
Coleby, B. : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Coleman, R G. : Nitrogen in Tropical Agriculture (Interference with Amino-acid Metabolism caused by Mineral Deficiency), 941
Colhoun, Dr. John : Appointed to the chair of cryptogamic botany in the University of Manchester, 598 ; work of, 598
Coli-Phage (T_2) Preparations : Plaque-forming Ability of Urea- or Phenol-treated (Dr. P. H. Hofschneider), 330
Collagen Structure : Reversible Transformation of Gelatin to the (Dr. Arthur Veis and Dr. Jerome Cohen), 720
Collagenase Maceration of Kidney for Microdissection (Nancy J. Hayward), 403
Collar, Prof A. R. : Aspects of Aeronautical Sciences, *review*, 665
College of Aeronautics : Appointment of J R. Ellis as professor of automobile engineering and first director of the Advanced School of Automobile Engineering at Cranfield, 762
College (A Staff), for Technical Teachers, 185
College Graduates : Fertility of (Population Reference Bureau, Inc , *Population Bulletin*, Vol 15, No. 6), 22
College Graduates (American) : Marriage-Rate of, 22
Colleges and Universities : Research and Development in, in the Fiscal Year 1958 (United States National Science Foundation Report on), 1016
Colleges (Technical) : Governing, 769
  The Supply and Training of Teachers for (Ministry of Education), 185
Colleges (Technical), and their Government (Joint Federation of British Industries Technical Colleges Committee), 769
Collier, K. G. : The Social Purposes of Education, *review* by Prof. H. L. Elvin, 420
Collins, Dr. F. D. : Heterogeneity of Lecithins labelled with Phosphorus-32, 366
Collins, W. G. : Appointed lecturer in civil engineering at the University of Leeds, 767
Collinson, A. J. L , and others : Self-Quenching Geiger Counters containing Mixtures of Permanent Gases, 876
Collison, Dr. Roger, and McDonald, Dr M. P. : Broadening of the Water Proton Line in High-Resolution Nuclear Magnetic Resonance Spectra of Starch Gels, 548
Colonial Agricultural, Animal Health and Forestry Research, Committee for : Report for 1958-59, 501
Colonial Economic Research Committee : Report for 1958-59, 501
Colonial Fisheries Advisory Committee : Report for 1958-59, 501
Colonial Medical Research Committee : Report for 1958-59, 501
Colonial Office : Colonial Research 1958-1959—Reports of the Colonial Research Council, Committee for Colonial Agricultural, Animal Health and Forestry Research, Colonial Economic Research Committee, Colonial Fisheries Advisory Committee, Colonial Medical Research Committee, Colonial Pesticides Research Committee, Colonial Products Council, Colonial Road Research Committee, Colonial Social Sciences Research Council, Tsetse Fly and Trypanosomiasis Committee, Director of the Anti-Locust Research Centre, and Research Matters not covered by the above Reports of the Specialist Advisory Bodies, 501
Colonial Pesticides Research Committee : Report for 1958-59, 501
Colonial Products Council : Report for 1958-59, 501
Colonial Research 1958-59—Reports of the Colonial Research Council, Committee for Colonial Agricultural, Animal Health and Forestry Research, Colonial Economic Research Committee, Colonial Fisheries Advisory Committee, Colonial Medical Research Committee, Colonial Pesticides Research Committee, Colonial Products Council, Colonial Road Research Committee, Colonial Social Sciences Research Council, Tsetse Fly and Trypanosomiasis Committee, Director of the Anti-Locust Research Centre, and Research Matters not covered by the above Reports of the Specialist Advisory Bodies (Colonial Office), 501
Colonial Research Committees, 280
Colonial Research Council : Report for 1958-59, 501
Colonial Road Research Committee : Report for 1958-59, 501
Colonial Social Sciences Research Council : Report for 1958-59, 501
Colour Change in Amphibians : Control of (C. Barker Jørgensen and Lis Olesen Larsen), 641
Colour Modifier in *Aspergillus nidulans* 'Sage', a (B. J. Kilbey), 906
Colour-forming Species in Peroxy Titanium Sulphate : Nature of the (Dr. C. C. Patel and M. S. Mohan), 803
Coloured Sulphur Deposits at Low Temperatures (Dr. B. Meyer and Prof. E Schumacher), 801
Colton, R , and others : Some New Complexes of Rhenium, 233
Columbia Plateau : Miocene Floras of the, Part 1, Composition and Interpretation (Ralph W Chaney) ; Part 2, Systematic Considerations (Ralph W. Chaney and Daniel I. Axelrod), *review* by Prof J. Walton, 66
Comber, H. F. : Elected an Associate *honoris causa* of the Linnean Society of London, 766
Combined Application of Hydrogen Peroxide and Ionizing Rays in Animal Experiments (E. Fleischmann, H Werkgartner and K. Karrer), 324
Combustion (International Symposium on), 938
Comfort, Dr. A. : Dependence of the Sex Ratio at Birth on the Age of the Father, 1065
Comitato Nazionale per le Richerche Nucleari : Fifth Nuclear Congress, 127
Commerce : Appointments in Industry and, 682

Commercial Thermoelectric Cold Box (General Electric Co., Ltd.), 439
Commons, House of : Adjournment Debate on Marine Nuclear Propulsion, 122
  Debate on the Ballistic Missile Early Warning Station at Fylingdales Moor, 357
  Debate on the Crowther Report, 577
  Debate on the Supply of Teachers of Mathematics, 600
Commonwealth : Teachers for the (Conference on), 281
Commonwealth Agricultural Bureaux : Plants Recorded as Resistant to Root-Knot Nematodes (*Meloidogyne* spp.), (Mary T. Franklin and D. J. Hooper), 684
Commonwealth Conference on Mycology (Commonwealth Mycological Institute, 361, 523
Commonwealth Co-operation : State Scholarships and, 935
Commonwealth Entomological Conference (Commonwealth Institute of Entomology), 603
Commonwealth Fund : Harkness Fellowships for 1960, 15
Commonwealth Institute of Entomology : Seventh Commonwealth Entomological Conference, 603
Commonwealth Mycological Conference : Sixth (Commonwealth Mycological Institute), 361, 523
Commonwealth Mycological Institute : Sixth Commonwealth Mycological Conference, 361, 523
Commonwealth Scientific and Industrial Research Organization (Australian) : Appointment of Lord Casey and E. P S. Roberts as members of the Executive, 12
  Rural Research, 29, Mistletoe in Australia (G. C. Greenham), 135
  Appointment of Dr Geoffrey Kesteven as director of fisheries research in the Division of Fisheries and Oceanography at Cronulla, 280
  Appointment of Dr. Douglas F. Waterhouse as chief of the Division of Entomology, 763
  Symposium on Nitrogen in Tropical Agriculture, 941
  Symposium on Visco-Elastic Systems, 942
Commonwealth Society for the Blind (Royal) : Blindness in West Africa (Prof F. C. Rodger), *review* by R. C. Davenport, 64
Commonwealth (British) . Scientific Research in the Overseas Territories of the, 501
  Teaching within the, 281
Commonwealth (British), Association of Universities of the : Report for 1958-59, 600
Communication Research at Keele, 599
Communications from Superior Galactic Communities (Prof. R. N. Bracewell), 670
Communications (International), and Scientific Journals, 358
Communities (Superior Galactic) : Communications from (Prof. R. N. Bracewell), 670
Comparative Biochemistry and Physiology, Vol 1, No. 1, 764
Comparative Studies of Yeasts (J. A. Barnett), 449
Comparison of Adhering and Abscising Fruits of Peach treated with N-1-Naphthyl Phthalamic Acid (Prof. Loyd E. Powell and Charlotte Pratt), 814
Comparison of the Charges of the Electron, Proton and Neutron (A. M. Hillas and T. E. Cranshaw), 459
Comparison of Iodine-124 and Iodine-131 Thyroid Dosimetry (Dr. C. M. E. Matthews and Dr. J. F. Fowler), 983
Competent Cells (Immunologically), in the Chick Embryo : Loss of Specificity on Passage of (Sir Macfarlane Burnet and Georgiana Boyer), 175
Competition for Science Teachers (*Teaching Science*), 126
Complement : Effect of Antibody and, on Volume Control in an Ascites Tumour Cell (Dr H Green and Dr. F. Silverblatt), 646
  Further Evidence for the Dual Nature of the Third Component of (Dr. J. D. Hawkins), 483
C'_4 : Role of, in the Antiglobulin Reaction (G. C Jenkins, Margaret J. Polley and Dr. P L. Mollison), 482
Complex (Metal) : Rate of Ligand Exchange with its, by a Polarimetric Method (B. Bosnich, Dr. F. P. Dwyer and Dr. A. M. Sargeson), 966
Complex (Polynucleotide) : Polyinosinic plus Polycytidylic Acid—a Crystalline (Dr David R Davies), 1030
Complexes of Calcium–Montmorillonite with Polymers (W. W. Emerson), 573
Complexes of Rhenium : Some New (R. Colton, R Levitus and Prof. G. Wilkinson), 233
Complexes of the Type $[M(NH_3)_5X]^{n+}$: Mechanism of the Electroreduction of (Prof. George W Watt and Joe W. Vaughn), 309
Complexes (Copper), and Organic Bases Addition Compounds between (R. C. Traill), 631
Complexes (Metal Hydrazine) · The 'Irving–Williams' Order in the Metal-ligand Stretching Frequencies of some (Prof. L. Sacconi and A. Sabatini), 549
Component (Indoxyl-acetate Splitting), in the α_2-Globulin Region of Normal Human Sera : Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an (Dr. Jan Hirschfeld), 321
Component (Third), of Complement : Further Evidence for the Dual Nature of the (Dr. J D. Hawkins), 483
Components : Semiconductors, 602
Components (Cytochrome), in Chloroplasts · Function of the Two—a Working Hypothesis (Dr. R. Hill and Dr. Fay Bendall), 136
Components (Electrophoretic), of the Proteins in Honeybee Larval Food (N G Patel, M H. Haydak and T. A. Gochnauer), 633
Components (Protein), from Turnip Yellow Mosaic Virus (Dr. J. M. Kaper), 219
Composition (Amino-Acid), of Proteins from Surface Tissue of the Tongue (Dr. C J. Barnes and Dr. L. N Ferguson), 617
Composition (Isotopic), of Potassium (B. R F Kendall), 225
Composition (Mineralogical), of some <2 Micron Fractions in a Sediment Core from the Mindanao Trough (J. Ch. L. Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 5), 609
Composition, Structure, Shape and Function of a Salivary Mucoprotein : Correlation between (Dr Alfred Gottschalk), 949
Compound (Ninhydrin-positive), probably a Peptide : Urinary Excretion of a, after Administration of β-Aminoisobutyric Acid to the Mouse (Dr. James B. Gilbert and Dr. Yuoh Ku), 160
Compounds : Co-ordination—their Chemistry and Applications (Department of Chemical Technology of the Bradford Institute of Technology Symposium on), 440
Compounds labelled with Carbon-14 : Radioassay by Gas Chromatography of (Dr. Arthur Karmen and Harold R. Tritch), 150
Compounds (Addition), between Copper Complexes and Organic Bases (R. C. Traill), 631
Compounds (Aromatic) : Effect of Solvent Polarizability on the Ultraviolet Spectral Shifts of (Dr. F. A. Bovey and S. S. Yanari), 1042
Compounds (Flavonoid), in the Inflorescence of *Helichrysum arenarium* (Z. I. Jerzmanowska and J. T. Grzybowska), 807
Compounds (New Clathrate), of the Inert Gases (J. G. Waller), 429
Compounds (Nitrogenous) : Use of Ionizing Radiation in Spot Tests for (H. J. M. Bowen, E. Arter and P. A. Cawse), 383
Compounds (Organic) : Use of Solvents containing Ethyl Iodide in the Investigation of Phosphorescence Spectra of (Dr. I. J. Graham-Bryce and J. M. Corkill), 965
Compounds (Sulphur) : The Metabolism of (Leslie Young and George A. Maw), *review* by Dr. G D. Greville, 424
Compounds (Sulphydryl) : Effect of Oxygen on the Radiosensitivity of Bacteriophage in the Presence of (Dr. P. Howard-Flanders), 485
Compounds (Sulphydryl), in Rat Liver : Level of, following Feeding with Goitrogenous and Nongoitrogenous Cabbage (Jozef Sedlák), 892
Compounds (Surface-Active) Methods for the Evaluation of the Antibacterial Activity of (Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry Symposium on), 131, *erratum*, 206
Compressible Flow . Introduction to the Theory of (Prof. Shih-I Pai), *review* by Dr. G K Batchelor, 1000
Compston, Dr W , and others : Age of Emplacement of Granites, 702
Computation Centre, Provisional International . *Bulletin*, No. 8, 764
Computer . A New British, 201
  A New British Transistorized (General Electric Co., and International Computers and Tabulators, Ltd), 936
Computer Society, Ltd. (British) : Second Annual Conference, 361
Computers (Electronic), in Population Genetics (W. F. Bodmer), 851 ; (J. L. Crosby), 851
Computers and Tabulators, Ltd., International, (General Electric Co., and) : A New British Transistorized Computer, 936
Concentrated Sodium Hydroxide or Potassium Hydroxide : Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with (J. Wawrzyniak and Dr. B. Sujak), 467
Concentrated Solutions : The Physico-chemical Constants of Binary Systems in (Prof. Jean Timmermans), Vol. 1, Two Organic Compounds (without Hydroxyl Derivatives) ; Vol. 2, Two Organic Compounds (at least one a Hydroxyl Derivative), *review* by Dr. E. F. G Herington, 918
Concentration of Hydrocarbons in 'Painted' Mouse Skin · Effect of Molecular Structure upon (Mary Burnham and Fred G. Bock), 323
Concentration-Dependent Sedimentation of Aggregating Proteins in the Ultracentrifuge (Dr G. A. Gilbert), 882
Concrete Approach to Abstract Algebra (Prof. W. W. Sawyer), *review*, 69, 440
Concurrent Translocation : Evidence of (C. D. Nelson, H. J. Perkins and P. R. Gorham), 205
Condensation Product of Ethylenediamine with Noradrenaline or 3,4-Dihydroxymandelic Acid (Kunio Yagi, Toshiharu Nagatsu and Ikuko Nagatsu), 310
Conditions (Normal and Experimental) : Diurnal Temperature Variation in the Rhesus Monkey under (Dr. Lloyd B. Erikson), 83
Conduction of Heat in Solids (Prof. H. S. Carslaw and Prof J. C. Jaeger), second edition, *review* by Prof. L. S. Goddard, 421
  Mathematics and the, *review* by Prof L. S. Goddard, 421
Conduction in Myelinated, Isolated Nerve Fibres of the Frog : Effect of Curare on (Dr. Wolf D. Dettbarn), 891
Conductivity (Bulk), in Organic Crystals (Dr. H. Kallmann and Dr. M. Pope), 31
Conductivity Detectors (Thermal) : Effect of Carrier Gas on the Sensitivity of (C Bokhoven and A. Dijkstra), 793
Conferences : Guide to Press Arrangements for Scientific, Medical and Technical (edited by Ronald Bedford), 437
Congenital Malformations (International Medical Congress, Ltd., International Conference on), 685
Congo (Belgian) Flora of the, 764
Congo Belge et du Ruanda-Urundi · Flore du (Institut National pour l'Étude Agronomique du Congo Belge), Vol. 9, 764
Conjugation of 3·4-Benzpyrenols in Mouse Skin (Dr. K. H. Harper and Dr. G. Calcutt), 80
Connective Tissue and Osseous Chemistry in Lathyritic Rats : Aortic, Serum, (Dr. R A. Grant, M. Hathorn and Prof. Theodore Gillman), 164
Connell, G E. (Murray, R. K., and) : Elevation of Serum Haptoglobin in Rabbits in Response to Experimental Inflammation, 86
Connexion between S–S Bond Breakage and Inactivation by Radiation of a Dry Enzyme (Dilip K. Ray, Dr. Franklin Hutchinson and H. J. Morowitz), 312
Conquest of the Stars : Man's (Pierre Rousseau), *review* by D. H. P. Jones, 69
Conrad, R , and others : Letter Structure of the English Language, 414
Conrad (Capt. Robert Dexter) Award presented to Dr. R. E. Gibson, 122
Conservation of Nature and Natural Resources, International Union for · Seventh General Assembly, jointly with the eighth Technical Meeting, 206
Conservation of Paintings : Scientific Techniques in the, 437
Consisting Predominantly of Feldspar ? : Do Meteorites exist (Prof. K. Przibram), 300
Constant : The Liquid Friction (Dr. G. H. A. Cole), 301
Constant (Acidic Dissociation), of Alcoholic Hydroxyls of Oxycarboxylic Acids—Mandelic Acid (Dr. M T. Beck and M. Halmos), 388
Constants Galore, *review* by Dr. E. F. G Herington, 918
Constants (Physical and Chemical) : Tables of, and some Mathematical Functions (Dr G W C Kaye and Dr. T. H. Laby), twelfth edition, *review* by T. M. Yarwood, 67
Constants (Physico-chemical), of Binary Systems in Concentrated Solutions (Prof. Jean Timmermans), Vol 1, Two Organic Compounds (without Hydroxyl Derivatives) ; Vol 2, Two Organic Compounds (at least one a Hydroxyl Derivative), *review* by Dr. E. F. G. Herington, 918

Constants (Ultrasonic Propagation), in Supercooled Salol (Dr. S. Parthasarathy and V. N Bindal), 145
Constitution and Properties of the Iridium–Platinum Alloys (Dr. A. S. Darling), 211
Construct 'Reactive Inhibition' in the Interpretation of Age Changes in Performance (Dr. S. Griew and Dr R. Lynn), 182
Construction of Error-correcting Group Codes : A Systematic Method for the (Prof R B. Banerji), 627
Consulting Scientists, Association of Election of Officers for 1960-61, 766
Consumption and Refinery Production, 1958 and 1959 : United Kingdom Petroleum Industry Statistics relating to (Petroleum Information Bureau), 851
Contaminants in Tissue Culture : *L* Forms of Bacteria as (Dr I A. Macpherson and K. Allner), 992
Contamination (Aerial), of Agricultural Land : An Assessment of the Quantities of Fission Products likely to be found in Milk in the Event of (Dr R. J Garner), 1063
Continuity and Change in African Cultures (edited by William R. Bascon and Melville J. Kerskovits), *review* by G W. B. Huntingford, 38
Contractile Proteins in the X-Irradiated Embryo : Synthesis of (Dr. Yoshito Ogawa), 77
Contractility in Depolarized Smooth Muscle . Calcium and (Dr. P. A. Robertson), 316
Control of Colour Change in Amphibians (C Barker Jorgensen and Lis Olesen Larsen), 641
Control (Automatic) : First International Congress on, 439
Control (Automatic), in Soviet Industry (Department of Scientific and Industrial Research), 287
Control (Electronics and), Journal of, Vol. 4, 685
Control (Endocrine), of Sexual Reproduction in *Opalina ranarum* Parasitic in *Rana temporaria* (Dr M El Mofty and Prof. J. D. Smyth), 559
Control (International), of Narcotic Drugs, 21
Control (Nervous), of Movements in the Foregut of *Schistocerca gregaria* Forsk (Dr. K. U. Clarke and H Grenville), 98
Control (Noise) · Acoustic Tiles for, 602
Control (Volume), in an Ascites Tumour Cell : Effect of Antibody and Complement on (Dr H. Green and Dr F Silverblatt), 646
Control and Synthesis in Micro-organisms : Organization, *review* by Dr. B. A. Newton, 49
Controlled Thermonuclear Reactions : Bibliography on Plasma Physics and Magneto-hydrodynamics and their Applications to (J. D Ramer), 522
Convection (Royal Meteorological Society Symposium on), 604
Conversion (Alkaline), of 4-Hydroxyphenylpyruvic Acid to 4-Hydroxybenzaldehyde (Dr. C. H Doy), 529
Conversion (Hydrocarbon) Hydrocarbon Synthesis and (Indian Institute of Science Symposium on), 691
Conway, Dr Elsie . Occurrence of *Falkenbergia rufolanosa* on the West Coast of Scotland, 566
Cook, B. P (Steward, E G , and) . Mosaic Texture of Graphites, 797
Cook, E. R., and others : Synovial Proliferation induced by Polysaccharides, 251
Cook, Dr Gerald B. . Appointed chief chemist of the International Atomic Energy Agency, 854 ; work of, 854
Cook Strait, New Zealand : A Red Water Bloom of Rotifers in (Vivienne Cassie), 328
Cooke, Dr G. V. · Fertilizers and Profitable Farming, *review* by G. V. Jacks, 424
Cooper, J. S. : Appointed lecturer in prosthetics at the University of Bristol, 284
Co-operation in the Field of Scientific and Technical Research (Organization for European Economic Co-operation), 998
Co-operation (Commonwealth) : State Scholarships and, 935
Co-operation (European), for Science, 600
Co-operation (International), and the Production of Calcium-47, 1018
Co-operation (Wider), in Europe : British Dyestuffs and, 829
Co-operative Research in Europe, 520
Co-ordination of Light and Electron Microscopy (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Symposium on), 672
Co-ordination Compounds, their Chemistry and Applications (Department of Chemical Technology of the Bradford Institute of Technology Symposium on), 440
Copan, Thomas P. (Gulbransen, Earl A., and) : Crystal Growths and the Corrosion of Iron, 959
Cope, Dr. R. G : The Delta Plutonium Transition Temperature, 539
Cope, Sir Zachary · The Royal College of Surgeons of England—a History, *review* by Prof. Charles Singer, 35
Copisarow, A. C. . Appointed director of the Forest Products Research Laboratory, 934 ; work of, 934
Coppen, Dr. A J , and Gibbons, Dr. J. L. · Saliva–Serum Ratios of Tritium after the Administration of Tritiated Water, 724
Copper : Growth of Single Crystals of (Rev. D. S. Kemsley), 33 ; (Prof. E N. da C. Andrade), 540
Copper Complexes and Organic Bases : Addition Compounds between (R C. Traill), 631
Copper Protein (A New), from *Chlorella ellipsoidea* (Dr Sakae Katoh), 533
Copper and Solid Oxygen condensed at Very Low Temperatures from a Gas Discharge : Reaction between (Jerome Kruger and William J Ambs), 794
Corbino Disk : The Possibility of a Self-sustaining (Dr. D. Midgley), 377
Core 72 and 723 . Examinations of (W. Dekeyser), (Reports of the Swedish Deep-Sea Expedition, 1947-58, Vol. 10, Special Investigations, No. 2), 609
Core (Sediment), from the Central Equatorial Pacific : X-Ray Determination of Phillipsite in a (F. Lippman), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 10, Special Investigations, No 3), 609
Core (Sediment), from the Mindanao Trough (K. Fredriksson), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No 4), 609
  Mineralogical Composition of some <2 Micron Fractions in a (J. Ch L. Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 5), 609
  A Note on the Foraminifera in a (R A. Reyment), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No 6), 609
  Fragments of Calcareous Algae in a (H Horn af Rantzien), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 7), 609
Cores (Some Bottom), from the Swedish Deep-Sea Expedition, 1947-48 (A. S. Laughton), 609
Cores (Sediment), from the Mediterranean Sea and the Red Sea (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, No. 1), 609
Cores (Sediment) from the North Atlantic Ocean (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Nos. 4-5), 609
Cores (Sediment) from the West Pacific (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Nos. 4-7), 609
Corkill, J M (Graham-Bryce, Dr. I J , and) · Use of Solvents containing Ethyl Iodide in the Investigation of Phosphorescence Spectra of Organic Compounds, 965
Corlett, E. N. · Appointed senior Research Fellow in the Department of Engineering Production in the University of Birmingham, 937
Cormack, R. M. Statistical Methods in Biological and Medical Sciences, *review*, 746
Corn Borer (European) · Effect of Temperature on the Hibernation of the (Stanley D Beck), 774
Cornell University : Summer Laboratory Course in Techniques and Applications of the Electron Microscope, 127
Cornwell, J. F , and Wohlfarth, Dr E. P. : An Energy Band Interpolation Scheme, with Application to Body-centred Cubic Lithium, 379
Correlation : West-Pacific Stratigraphic (Dr. M F Glaessner), 1039
Correlation between Composition, Structure, Shape and Function of a Salivary Mucoprotein (Dr. Alfred Gottschalk), 949
Correlation of Occurrence of Whistlers with Geomagnetic Activities (Atsushi Kimpara), 230
Corrosion of Beryllium in Carbon Monoxide and in Carbon Dioxide Gas : Formation of Beryllium Carbide during the (V. D Scott), 466
Corrosion of Iron : Crystal Growths and the (Earl A Gulbransen and Thomas P. Copan), 959
Corsair, a Digital Differential Analyser (Royal Aircraft Establishment and Semiconductors, Ltd), 201
Corson, Dr Joseph M , and others · The Respiratory Dead Space of the Giraffe, 24
Cortex (Brain) Slices Active Transport of γ-Aminobutyric Acid in, with special reference to Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
Cortex (Rat Kidney) · Increase in 'Alkaline' Ribonuclease of, after Lysozyme and Egg-White Administration (Dr T. Maack, Dr R. Brentani and Dr. M. Rabinovitch), 158
Corticosteroids · Accumulation of Substrate by Isolated Rat Diaphragm—a Possible Mechanism for the Anti-Inflammatory Action of (Prof. Ira G. Wool), 728
Corticosterone Microbiological 11β-Hydroxy Dehydrogenation of (M. Shirasaka, R. Takasaki and M. Tsuruta), 390
Cortisone Acetate, Cholesterol and Lecithin : Enhancement of Staphylococcal Virulence for Mice by Intraperitoneal (Dr Daniel Amsterdam and Dr. S Stanley Schneierson), 101
Corwin, Dr. Laurence M , and Schwarz, Dr. Klaus : Maintenance of α-Ketoglutarate and Succinate Oxidation in E-Deficient Liver Homogenates by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine, 1048
Cosmic Noise : A Relation between Solar Radio Emission and Solar Cap Absorption of (Dr. M R. Kundu and Prof. F T. Haddock), 610
Cosmic Ray Intensity in Interplanetary Space (Dr. H. Elliot), 299
Cosmical Physics : Electromagnetic Phenomena in (edited by B Lehnert), (International Astronomical Union Symposium No. 6, Stockholm 1956), *review* by Dr. R. H Garstang, 67

Creep in the Post-yield Region · Supercontraction of Wool Fibres and (Dr. K. J. Whiteley), 473
Creep (High-Temperature), of Graphite (Dr. D. B. Fischbach), 795
Creger, Dr William P., and Thomas, Phyllis Menna : Micro-electrophoresis of Human White Cells and Platelets, 171
Crepidula fornicata L (Slipper Limpet), in Ireland : Occurrence of the (D. C. Arnold), 95
Cresswell, E. : Methane Exhalation in Sheep, 560
Crick, Dr. F H. C Elected to an Extraordinary Fellowship of Churchill College, Cambridge, 440
Criminology and Psychiatry . Social Science, *review* by Prof E. Stengel, 41
Cristallographie . Société Française de Minéralogie et de : Index of Crystallographic Supplies (edited by Dr. A J. Rose), second edition, 1019
Cronshaw, Dr C. J. T. · Awarded the Hinchley Medal of the British Association of Chemists, 685
Crook, E. M. (edited by) . Glutathione (Biochemical Society, Symposium No. 17, 1958), *review*, 669
Crookall, J. O., and others : Radioactive Fallout during 1959, 925
Crookall, Dr. Robert : Fossil Plants of the Carboniferous Rocks of Great Britain, second edition, *review* by T. M. Harris, 66
Crooks, R. N , and others · Radioactivity of the Atmosphere due to Distant Nuclear Test Explosions, 224
Crop Plant Resistance to Disease · Nature and Exploitation of (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Crop Protection : Scientific Problems of (Hungarian Academy of Sciences International Conference on), 523
Crop Yield : Plant Population and (R Holliday), 22
Crops (Farm) Diseases of (A. Beaumont), *review* by J. M Hirst, 85
Crosby, J. L : Electronic Computers in Population Genetics, 851
Cross, Dr. K. W · Appointed to the University of London chair of physiology in the London Hospital Medical College, 522, 598 ; work of, 598
Cross-Linking (Radiation-induced), in Hydrocarbon Polymers : Mode of (T. F. Williams), 544
Cross-Modal Transfer of Training in Monkeys (D. Burton and Dr. G. Ettlinger), 1071
Crossing-Over (Apparent Double), in a Short Genetic Interval in *Drosophila melanogaster* (Prof. M. M. Green), 990
Crossley, Prof E. L. (edited by) : The United Kingdom Dairy Industry, *review* by Dr. C C. Balch, 504
Crowther, Dr. B M. : At the Scientific Publications Council's Discussion on the Rapid Increase in the number of New Scientific Journals, 18
Croxton, Prof Frederick E. : Elementary Statistics with Applications in Medicine and the Biological Sciences, *review* by R. M. Cormack, 746
Cruickshank, Prof. E. K., and Rodgers, Dr. P. E. Medical Research in the British Caribbean (Spinal Arachnoiditis in Jamaica), 863
Cryptogamic Botany at Manchester, 598
Crystal Growths and the Corrosion of Iron (Earl A. Gulbransen and Thomas P Copan), 959
Crystal Structure of Adenosine-5'-phosphate (J Kraut and L. H Jensen), 798
Crystal Structure of Indanthrene : Electron Microscopy and the (Lewis T. Chadderton), 541
Crystal Structure of Mellitic Acid (S. F. Darlow), 542
Crystal Structure of Potassium Trivanadate (Dr. Stanley Block), 540
Crystal Structure of Tetraphenyl*cyclo*butadiene Iron Tricarbonyl (R. P. Dodge and Dr V. Schomaker), 798
Crystal Structure Determination · Modern Methods of (Manchester College of Science and Technology Summer School in), 766
Crystalline Methacrylic Acid : Polymerization of, initiated by Ultra-violet Radiation (Dr C. H. Bamford, A. D. Jenkins and J C. Ward), 713
Crystalline Modification (Second), in Polyethylene . Effect of a, on X-Ray Crystallinity Measurements (Dr C. G. Vonk), 962
Crystalline Polynucleotide Complex · Polyinosinic plus Polycytidylic Acid —a (Dr. David R. Davies), 1030
Crystallinity Measurements (X-Ray) : Effect of a Second Crystalline Modification in Polyethylene on (Dr. C. G. Vonk), 962
Crystallization of an Algal Cytochrome, *Porphyra tenera*–Cytochrome 553 (Dr. Sakae Katoh), 138
Crystallization of Purified Mouse Encephalomyocarditis Virus Particles (P. Faulkner, E. M. Martin, S. Sved and Dr. T. S Work), 908
Crystallographic Supplies : Index of (edited by Dr. A. J. Rose), second edition (Société Française de Minéralogie et de Cristallographie), 1019
Crystallography, International Union of : Fifth General Assembly, 1020
  Symposium on Thermal Motion in Crystals and Molecules, 1020
  Symposium on Lattice Defects and the Mechanical Properties of Solids, 1020
Crystallography, International Union of (Commission on Crystallographic Apparatus) : Index of Crystallographic Supplies (edited by Dr. A. J. Rose), second edition, 1019
Crystals (Aluminium Single) : First Stage of Work Hardening in (N. A. McKinnon), 148
Crystals (Organic) : Bulk Conductivity in (Dr. M. Kallmann and Dr. H. Pope), 31
Crystals (Silver Single) : Orientation of Stearic Acid Monolayers on (Robert T. Mathieson), 301
Crystals (Single), of Copper · Growth of (Rev. D. S. Kemsley), 33 ; (Prof. E. N da C. Andrade), 540
Crystals (Single), of Potassium Chloride containing Barium Chloride : Micromosaic Patterns in (J. Ewles and J. B. Dawson), 381
Crystals and Molecules : Thermal Motion in (International Union of Crystallography Symposium on), 1020
Cubic Lithium (Body-cenered) : An Energy Band Interpolation Scheme, with Application to (J. F. Cornwell and Dr. E. P. Wohlfarth), 379
Cultivation (Monoxenic), of an Enchytraeid Annelid (Dr. Ellsworth C. Dougherty and Bjørn Solberg), 1067
Cultural Geography (Physical and) : Practical Field Techniques in (Geographical Association Course in), 1020
Culture : Spontaneous Potentials from Explants of Brain Tissue in (Prof. A. W. B. Cunningham, Marshall Dougherty and B. J. Rylander), 477
  Trout and Salmon—Hatchery Methods (Earl Leitritz), 204
Culture of Human Leucocytes on the Chorioallantoic Membrane of the Chick (Eugene Bell), 403
Culture (Pure), of the Trichomycete, *Amoebidium parasiticum* (Dr. Howard C. Whisler), 732
Culture (Quantitative Tissue) · Effect of Supernatant Potassium-Level on Cardiac Activity in (Prof. A. W. B. Cunningham, K. Kleutch and W. Herbst), 241
Culture (Tissue) : Effect of Oxygen and Nitric Oxide on the Radiosensitivity of Human Cells in (Dr. D. L. Dewey), 780
  L Forms of Bacteria as Contaminants in (Dr I A. Macpherson and K. Allner), 992
Culture Filtrates of an Encapsulated *Staphylococcus aureus* : Isolation of a Phagocytosis-inhibiting Substance from (Dr Stephen I Morse), 102
Culture Filtrates (Heated) : Starch–Agar-Gel Electrophoresis of Tuberculoproteins from (T. P. Dekker), 392
Cultures : African, *review* by G. W. B. Huntingford, 38
Cultures (African) Continuity and Change in (edited by William R. Bascon and Melville J Herskovits), *review* by G. W B. Huntingford, 38
Cultures (Dried) · Recovery of Adult *Amoeba lescherae* from (Monica Taylor), 329
Cunningham, Prof. A. W. B., and others : Effect of Supernatant Potassium-Level on Cardiac Activity in Quantitative Tissue Culture, 241
  Spontaneous Potentials from Explants of Brain Tissue in Culture, 477
Cunningham, Dr C. A., and others : An Rh Antibody Specific for V and R's, 171
Cunningham, Prof G J., and others Life-like Preservation of Cytoplasmic Detail in Plant Cells, 1068
Cupric Alkanoate Solutions : Nature of (Dr. D. P Graddon), 715
Curare : Effect of, on Conduction in Myelinated, Isolated Nerve Fibres of the Frog (Dr Wolf D Dettbarn), 891
Curtis, Prof. W E. : *Obituary* of Prof. E. G. Richardson, 678
Curtiss, Dr. L. F. Introduction to Neutron Physics, *review* by Dr. P. A. Egelstaff, 187
Curzon, F. L., and others : Growth of Surface Instabilities in a Linear Pinched Discharge, 624
Cuthbertson, Dr D. P. : *Obituary* of Dr. John Duckworth, 678
  Minor Elements in Nutrition, 939
Cuticle (Insect) : Wetting Properties of (J. W. L. Beament), 408
Cuttings Developments in the Propagation of Clones of *Hevea brasiliensis* by (G H Tinley and R. J Garner), 407
Cyanamid Company (American) . Lederle Medical Student Research Fellowships, 283
Cyanamid European Research Institute, Geneva : Election of Dr. Richard O Roblin as president and director, 361
  Election of Dr Mario Scalera as a vice-president, 361
Cyanamid International, London : New List of Medical and Technical Papers prepared by Research Workers, 523
'Cyclodiene' Insecticides · Mechanisms of Resistance of the Adult Housefly (*Musca domestica*) to (Dr. G T Brooks), 96
Cylindrical Structures : Electromagnetic Radiation from (James R. Wait), *review* by W. Brown, 583
Cynkin, Dr. Morris A , and Ashwell, Dr. Gilbert : Estimation of 3-Deoxy Sugars by means of the Malonaldehyde–Thiobarbituric Acid Reaction, 155
'Cystase' (Snail) : *Volvox* Colonies and (Dr. B C Sharman), 90
Cystine Content in Skin of Rats · Effect of Vitamin A on the (Prof Tatsuo Koyanagi and Satoru Odagiri), 809
Cytidine (A Methyl), from the Ribonucleic Acid of *Anacystis nidulans* (Dr. B. B Biswas and J. Myers), 238
Cytochemical Observations (Quantitative), on a Specific Nucleoprotein Reaction in Cell Nuclei (Dr E. A. Barnard), 447
Cytochemical Reactions : A New Technique for Studying the Quantitative Aspects of, and Its Application to the Feulgen Reaction (P van Duijn and J.-P. Persijn), 805
Cytochrome b_5 (Inactivation of), by Oxygen Flavin Dissociation and (A New Type of Autoxidation Reaction), (J. McD. Armstrong, Dr. J H. Coates and Prof. R K. Morton), 1033
Cytochrome *c* Reductase · Cause of the Instability of (A New Type of Autoxidation Reaction), (Dr. Malcolm Dixon, J M Maynard and P. F W Morrow), 1032
Cytochrome Components in Chloroplasts : Function of the Two—a Working Hypothesis (Dr. R. Hill and Dr Fay Bendall), 136
Cytochrome (Algal), *Porphyra tenera*–Cytochrome 553 · Crystallization of an (Dr. Sakae Katoh), 138
Cytology, (in Russian), Vol. I, No. I, 601
Cytopathogenic Agent from Skin Lesions of Cattle · Isolation of a (Dr. C. Huygelen, D Thienpont and M. Vandervelden), 979
Cytoplasmic Detail in Plant Cells : Life-like Preservation of (Dr J. Chayen, Prof G J. Cunningham, P. B. Gahan and A. A Silcox), 1068
Cytoplasmic Inclusions of the Ageing Neurons of some Teleosts (Prof A. Stolk), 332
Cytoplasmic Particulates : Active Transport of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to Phosphorus-32 Turnover of Phospholipids in (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
Czapski, G., and others Mechanism of the Oxidation and Reduction of Metal Ions by Hydrogen Atoms, 629

Delfini, Dr. Carlo, and others · Characterization of a New Purine Riboside isolated from *Fusarium* Species, 968
Delong, A. (Drahoš, V, and) · A Simple Method for Obtaining Perforated Supporting Membranes for Electron Microscopy, 104
Delphinium · Experimentally Induced Inter-bivalent Redistribution of Chiasmata in (H. K Jain and A. K. Bose), 260
Delta Plutonium Transition Temperature (Dr R G. Cope), 539
Demands (Environmental): Sensory Specialization in Response to (Zoological Society of London Symposium on), 688
Demer, L J. (Westwood, A. R. C., and): Piling-up of Dislocations beneath a Surface Film, 146
Demetsopoullos, I. C., and others: Self-Quenching Geiger Counters containing Mixtures of Permanent Gases, 876
Demonstration of Interference by Noncytocidal Strains of Rabies Virus: An Indicator Plaque-forming System for (Dr. Martin M Kaplan, Dr. Eberhard Wecker, Dr. Zlatko Forsek and Dr. Hilary Koprowski), 821
Demonstration of their Renal Origin: Ultrastructure of the Clear Cells in Renal Carcinomas and its Importance for the (Prof. Ch. Oberling, M. Rivière and Fr Haguenau), 402
Demonstration (Agar-gel Electrophoretic), of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera (Dr. Jan Hirschfeld), 321
Demonstration (Histochemical), of Ascorbic Acid in the Locus Coeruleus of the Mammalian Brain (Dr. Nobuo Shimizu, Tomokazu Matsunami and Satoko Onishi), 479

Denatured Ferritin and Apoferritin : X-Ray Diffraction Study of (Vladimir Kleinwachter), 313
Dendrocoelum Œrsted (Genus), (*Turbellaria tricladida paludicola*) Chromosome Numbers of Four Species of the (Dr. Anders G. Dahm), 334
Denervation: Effect of, on Potassium-42 Uptake by the Rat Muscle *in vitro* (Dr. Z Drahota and O. Hudlická), 396
Denhardt, Dr. D. T. : A Possible Basis for Immunological Tolerance, 728
Dennis, J. A., and others : Self-Quenching Geiger Counters containing Mixtures of Permanent Gases, 876
Densities (Helium) : Structure of High-Rank Coals deduced from (T. S. Polansky, H. J. Donald and Prof C R. Kinney), 792
Density : Adsorption of Helium on Carbons—Influence on Measurement of (Dr F. A. P. Maggs, P. H. Schwabe and J. H. Williams), 956
Density of the Upper Atmosphere and its Dependence on the Sun, as revealed by Satellite Orbits (D G King-Hele and D. M. C. Walker), 928
Density (Electron) Measurements in the Upper Ionosphere using the Faraday Rotation of Radio Signals from Artificial Satellites (Dr. D. McL. A. Wilson), 623
Density (Upper-Atmosphere Air), at the Height of 180-212 km derived from the Orbit of *Sputnik III* : Profile of (Z. V. Bochníček), 460
Dental Caries and certain Soil Conditions in New Zealand : An Association between (T. G. Ludwig, W B Healy and Capt. F L. Losee), 695
Dental Research in Britain, 600
Dental Hospital (Royal), of London School of Dental Surgery : Appointment of Dr H. J J Blackwood as reader in oral anatomy, 938
Denton, Dr. E. J : Sensory Specialization in Response to Environmental Demands (Design of Fish and Cephalopod Eyes in relation to their Environment), 689
3-Deoxy Sugars : Estimation of, by means of the Malonaldehyde–Thiobarbituric Acid Reaction (Dr. Morris A. Cynkin and Dr. Gilbert Ashwell), 155
Deoxy Sugars and Sialic Acids : Thiobarbituric Acid Spray Reagent for (Dr. Leonard Warren), 237
5-Deoxycytidylic Acid : Enzymatic Deamination of, and of 5-Methyl-5'-deoxycytidylic Acid in Growing and Non-growing Tissues (Dr. Eduardo Scarano, Massimo Talarico, Luisa Bonaduce and Benita De Petrocellis), 237
Deoxyribonucleic Acid : Mechanism of the Radiation Effect on the Synthesis of (Dr. R. J. Berry, E. Hell, Dr. L G. Lajtha and Dr. M. Ebert), 563
Deoxyribonucleic Acid in Dilute Aqueous Solution : Chemical Effects of Ionizing Radiation on (G. Hems), 710
Deoxyribonucleic Acid Content of Mouse Sarcoma 37 Cells : Changes in the, following Serial Irradiation (Dr. A. E. G. Pearson and N. B. Atkin), 647
Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat : Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the (S L. Liu), 475
Deoxyribonucleic Acid Label in Man : Hazard of Tritium as a (R. Oliver and Dr. L. J. Lajtha), 91
Deoxyribonucleic Acids from Human Leucocytes : Infra-Red Spectra of (G. Zerbi, P. A. Bianchi and E. E. Polli), 964
Dependence of the Sex Ratio at Birth on the Age of the Father (Dr. Leo Szilard), 649 ; (Dr. A. Comfort), 1065
Dependence on the Sun : Density of the Upper Atmosphere and its, as revealed by Satellite Orbits (D. G. King-Hele and D. M. C. Walker), 928
Depolarization of the Fluorescence of Proteins labelled with various Fluorescent Dyes (C S Chadwick, Dr. P. Johnson and E G. Richards), 239
Depolarized Smooth Muscle : Calcium and Contractility in (Dr. P. A. Robertson), 316
Deposition of Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith) : Effect of a Sewage Effluent Discharge on the (R. W. Edwards and J. Heywood), 492
Deposits (Dieldrin) : Determination of, on Sprayed Mud Surfaces (Dr R. E. Ford), 994
Depression : Treatment of, by Drugs and other Means (Dr. Linford Rees), 114
Depressions (Freezing-Point), of Hoagland's 'Carbowax' Systems (Howard G Applegate), 232
Derby, Earl of : Presidential Address to the Textile Institute, 436
Derivatives (Guanidine) : Antimalarial Properties of some (Y Ch. Chin, Y. Y. Wu, B. Skowrońska-Serafin, Prof. T. Urbański and J. Venulet), 170
Desalting of Urine by Electrodialysis (Dr. T. Wood), 634
Design (Optical) : Research in, at the Imperial College, London, 934
Designs (Roof) : Snow Loads and, 603
Detail (Cytoplasmic), in Plant Cells : Life-like Preservation of (Dr. J. Chayen, Prof. G. J. Cunningham, P. B. Gahan and A. A. Silcox), 1068
Detection of Negative Ions formed by Charge Transfer (T. M. Donahue and F. Hushfar), 1038
Detection of Nitrous Acid : Application of Pyramidone to (Dr. Wiktor Wawrzyczek), 883
Detection of N-Oxides of the Pyrrolizidine Alkaloids (A. T. Dann), 1051
Detection of Recently Produced Fission Products in the Atmosphere (Dr. W. Anderson, Dr. R. E. Bentley, L. K. Burton and Dr. C. A. Greatorex) 223
Detection (Optical), of Nuclear Magnetic Resonance (J. Brossel), 440
Detection (Specific), of Glucose on Paper Chromatograms (Dr. M. R. J. Salton), 966
Detection and Estimation of a Facial Eczema Toxin, Sporidesmin (G. R. Russell), 788
Detectors (Thermal Conductivity) : Effect of Carrier Gas on the Sensitivity of (C. Bokhoven and A Dijkstra), 793
Determination of Adsorption in Double Layers involving Solid Metals (Dr. Erik A. Blomgren and Dr. John O'M. Bockris), 305
Determination of Calcium in Blood Serum by Atomic Absorption Spectroscopy (J B. Willis), 249
Determination of Dieldrin Deposits on Sprayed Mud Surfaces (Dr. R. E. Ford), 994
Determination of Physiological Age for Female *Glossina morsitans* (D. S. Saunders), 651
Determination of Small Rapid Volume Changes in a Muscle during Activity (Prof. B. C. Abbott and R. J. Baskin), 1055
Determination of Sulphate : A Modification for Washing the Benzidine Sulphate Precipitate in the (Dr I. P T. Hakkinen), 232
Determination (Age), in the Harbour Seal, *Phoca vitulina* L. (A. W Mansfield and H. D. Fisher), 92
Determination (Crystal Structure) : Modern Methods of (Manchester College of Science and Technology Summer School in), 766
Determination (Environmental), of Sex in a Parthenogenetic Parasite (F. Wilson and L. T. Woolcock), 99
Determination (X-Ray), of Phillipsite in a Sediment Core from the Central Equatorial Pacific (F. Lippman), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 10, Special Investigations, No 3), 609
Determining the Rheological Properties of Dough made from Wheaten Flour : A Role for Thiol and Disulphide Groups in (R. Frater, Dr. F. J. R. Hird, H. J. Moss and J. R. Yates), 451
Detonations, Flammability and Ignition : Explosions, Part I (Prof. S. S. Penner) ; Part 2 (B. P. Mullins), *review* by Dr H F Coward, 666
Detoxication during Secondary Growth in Plants (C. M. Stewart), 374
Dettbarn, Dr. Wolf D. : Effect of Curare on Conduction in Myelinated, Isolated Nerve Fibres of the Frog, 891
Deuchar, Dr. D. C. : Cardiac Neuroses, *review*, 423
Deuterium-labelled Carbohydrates : Infra-red Spectra of (Dr S. A. Barker, R. H. Moore, Prof. M. Stacey and Dr. D H. Whiffen), 307
Deutsche Akademie der Naturforscher, Halle : Election of new Members, 766
Deutsche Geologische Vereinigung : Jubilee Meeting (Discussion on Orogens), 206, 689
  Steinmann Medal awarded to Prof H. H. Read, 206, 690
Development : A Bibliography on the Economic and Social Implications of Scientific Research and (United States National Science Foundation), 14
  Projects in Colleges and Universities on the Economic and other Impacts of Scientific Research and (United States National Science Foundation), 14
Development in Britain : Amenities and, 265
Development of Ballistic Missiles, 358
Development of Carrageenin Granuloma : Biological Significance of Peptide containing Hydroxyproline during the (Dr. M Chvapil and B. Cmuchalová), 806
Development of 5-Hydroxytryptophan Decarboxylase Activity in Rat Kidney (Dr. Irene Huang, Sheila Tannenbaum and Dr. David Yi-Yung Hsia), 717
Development of the Infective Larvae of *Oesophagostomum radiatum* (Rud. 1803) (Strongylidae : Nematoda) : Effect of X-Rays on the (R. F. Riek and R. K. Keith), 981
Development of Learning in the Rhesus Monkey (Harry F. Harlow and colleagues), 211
Development of Nuclear Energy in Britain, 1
Development of Resistance in Mice to Tumour Induction by *S E* Polyoma Virus (Sarah E. Stewart, Bernice E. Eddy, Marjean Irwin and Stephanie Lee), 615
Development of Science in South-East Asia (Unesco South-East Asia Science Co-operation Office and the Indonesian Council of Sciences Discussion on), 859
Development of the Teaching of Chemistry : Status and (Organization for European Economic Co-operation Seminar on the), 208
Develoment (Academic Research and) : United States Expenditure on, 1016
Development (Aeronautical Research and), Advisory Group for (NATO) : AGARDOgraph No 31, Explosions, Detonations, Flammability and Ignition, Part I (Prof. S. S. Penner) ; Part 2 (B. P. Mullins), *review* by Dr. H. F. Coward, 666
  Meeting on Ionospheric Research, 685
  Discussion on Boundary Layer Research, 1022
Development (The Future), of Management Education and of Business Studies—Revision of Joint Examination Schemes (Ministry of Education, Circular 1/60), 743
Development (Overseas) : Assistance from the United Kingdom for (White Paper on), 501
Development (Progressive), in *Habrobracon* Females : Divergence between Lethal Doses and Sterilizing Doses of X-Rays wtih (Dr. Howard E. Erdman), 254
Development (Research and), in Colleges and Universities in the Fiscal Year 1958 (United States National Science Foundation Report on), 1016
Development (Retarded) of *Ostertagia* Species in Sheep (J. D. Dunsmore), 986
Development Commissioners, and others : Postgraduate Training Grants in Fishery Research, 360
Development Expenditure : Industrial Research and, 1958 (Department of Scientific and Industrial Research), 997
Development Stages (Adult Male and Nymph), of *Triatoma infestans* : Non-Identity of Triosephosphate Dehydrogenase of (Prof. M. Agosin, A. Neghme and N. Scaramelli), 1052
Development and Productivity of Rice Plants : Stimulating Effects of Nuclear Radiations on (Dr. Maung Mya Thaung), 982
Developments in the Applications of Nuclear Science for Peaceful Purposes : Recent (CENTO Institute of Nuclear Science Symposium on), 685
Developments in the Propagation of Clones of *Hevea brasiliensis* by Cuttings (G. H. Tinley and R. J Garner), 407
Deverall, B. J. : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Deviants (Chromsomal) : Triploid Rat Embryos and other, after Colchicine Treatment and Polyspermy (L. Piko and O. Bomsel-Helmreich), 737
Devon (North) Countryside : Preservation of, 935
Dewar, Prof. M. J. S. : Elected a Fellow of the Royal Society, 11
  Appointed to the chair of organic chemistry in the University of Chicago, 762 ; work of, 762
Dewey, Dr. D. L. : Effect of Oxygen and Nitric Oxide on the Radiosensitivity of Human Cells in Tissue Culture, 780
Dewhirst, Dr. D. W. : The New Cosmography, *review*, 109
Dexter, R. R., and others (edited by) : Advances in Aeronautical Sciences—Proceedings of the First International Congress on the Aeronautical Sciences (Madrid 1958), *review* by Prof. A. R. Collar, 665
Dextranase (Bacterial) : Action of a, on Branched Dextrans (R W. Bailey, Dr. D. H. Hutson and Dr. H. Weigel), 553

Dextrans (Branched) · Action of a Bacterial Dextranase on (R W. Bailey, Dr. D H. Hutson and Dr. H. Weigel), 553
Diagnosis : Growth (Leona M. Bayer and Nancy Bayley), *review* by Dr. K. M. Hawkins, 45
Diagnosis of Human Growth, *review* by Dr. K. M. Hawkins, 45
Diamond, R., and Hirsch, P. B. . X-Ray Studies of some Carbonized Coals, 204
Diamond : Intrinsic Recombination Radiation in (J. C. Male and J. R. Prior), 1037
Diapause Eggs of *Acheta commodus* (Walk) : Effect of Sub-Zero Temperatures on (T W. Hogan), 98
Diaphragm (Isolated Rat) Accumulation of Substrate by—a Possible Mechanism for the Anti-Inflammatory Action of Corticosteroids (Prof. Ira G Wool), 728
Diaphragm (Rat) : Release of Acetylcholine in (K. Krnjević and J. F. Mitchell), 241
Diatomic Radicals containing Boron or Silicon : Absorption Spectra of (Dr. B. A. Thrush), 1044
2,6-Dichlorobenzonitrile, a New Herbicide (Dr. H. Koopman and J. Daams), 89
Dichotic Stimulation and Memory Disorder (Prof James Inglis), 181
Dickinson, H (Azam, M. N , and) Time-lags in the Intrinsic Electrical Breakdown of Glass, 146
Dictionary : Russian Machine Translation (H. S H. Massey), 852
Dictionary of Indian Raw Materials and Industrial Products : The Wealth of India, a— Raw Materials, Vol. 5, H–K, *review* by Dr F. N. Howes, 70
Dictionary of Nuclear Science, Engineering and Technology, in Four Languages (English–German–French–Italian) Atomic Terminology, a (compiled by Dr. Lore Lettenmeyer), *review* by Dr J B. Sykes, 67
Diczfalusy, E., and others : A New Class of Hormonally Active Steroids, 168
Dieldrin · Genetics of Resistance to, in *Lucilia cuprina* Wied. (G. J. Shanahan), 181
  Normal Susceptibility Levels of *Anopheles pharoensis* Theobald to DDT and (Dr. F. Kuhlow), 410
  Selection for High-Order Resistance to, in *Lucilia cuprina* Wied. (G. J. Shanahan), 100
Dieldrin Deposits : Determination of, on Sprayed Mud Surfaces (Dr. R. E. Ford), 994
Diet (British) : Strontium-90 Content of, 852
Dietary Intake of certain Insecticides : Influence of, on the Haemoglobin and Erythrocyte Contents of Chick Blood (Prof B. K. Srivastava, H. C. Saxena and J. C. Sharma), 172
Diethyl β-Acetamidoglutarate : Requirements for Stereospecificity in Hydrolysis by Chymotryptin— (Prof. Saul G. Cohen and Ezra Khedouri), 75
Diethylstilboestrol : Duration of Stimulation of Phagocytic Activity of the Reticulo-Endothelial System after Cessation of Treatment with (C. C. Ware and Prof. T Nicol), 974
Difference (Sex), in Accidental Mortality of Guppies exposed to Elevated Temperature (Prof John A. Freeman), 491
Differences in Numbers of Erythrocytes between Inbred Lines of Chickens (Dr. P. Jaffe), 978
Differences (Seasonal), in Ovulating Hormone in the Merino Ewe (Dr. D. R. Lamond), 971
Different Tensions of Oxygen : Some Effects of, on the Respiration and Growth of *L*-Strain Fibroplasts (A. R. Fisher), 315
Differential Analyser : The *Corsair*, a Digital (Royal Aircraft Establishment and Semiconductors, Ltd.), 201
Differential Geometry (Prof. Erwin Kreyszig), *review*, 70
Differential Test of Arts/Science Aptitude (L. Hudson), 413
Differentiation : Intraspecific—Biological and Social Aspects (Dr. Max Pettersson), 431
Differentiation (Sexual) : Evolutionary Origin of, and the Sex-Ratio (Dr. H. Kalmus and Dr. C. A. B. Smith), 1004
Differently Saturated Fats for Three Years : Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving (Prof. H. Fisher and A. S Feigenbaum), 85
Diffraction (Micro-) : A Technique for Sampling Oxide Layers and Brittle Materials for (A. M. Adams, M. A. Silva and Veronica M. Spiers), 147
Diffraction Study (X-Ray), of Denatured Ferritin and Apoferritin (Vladimir Kleinwächter), 313
Diffusion of Proteins through Lipophilic Agar Cells (Dr. Ch. Wunderly), 885
Digital Differential Analyser : The *Corsair*, a (Royal Aircraft Establishment and Semiconductors, Ltd), 201
1,4-Dihydrazinophthalazine · Effects of, on the Catechol Amines (M. Bygdeman and L. Stjarne), 82
Dihydrocodeine and Aminopyrine Analgesia (Morphine,) : Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), 893
3,4-Dihydroxymandelic Acid : Condensation Product of Ethylenediamine with Noradrenaline or (Kunio Yagi, Toshiharu Nagatsu and Ikuko Nagatsu), 310
Dihydroxyphenylalanine and 5-Hydroxyindoles · Vanadium Catalysis of the Oxidation of Catechol Amines, (Dr. G. M Martin, E. P. Benditt and N. Eriksen), 884
Dijkstra, A. (Bokhoven, C , and) : Effect of Carrier Gas on the Sensitivity of Thermal Conductivity Detectors, 793
Dikshit, Mandakini B. (Chaudhury, Prof. Ranjit Roy, and) . Milk-ejecting Action of Ergot, 722
Dilemma of the Far East, *review* by Prof. W. D. Borrie, 664
Dilli, S., and Green, Dr. J. H. : Radiation Synthesis of Urea, 383
Dilute Aqueous Solution : Chemical Effects of Ionizing Radiation on Deoxyribonucleic Acid in (G. Hems), 710
Dimer (Pyrene) · Radiative Life-time of the, and the Possible Role of Excited Dimers in Energy Transfer Processes (Dr. B. Stevens and E. Hutton), 1045
Dimerization of the Benzyloxyl Free Radical in Solution : Disproportionation and (Dr. J. B. de Sousa and S. K. Ho), 776
Dimers (Excited), in Energy Transfer Processes : Radiative Life-time of the Pyrene Dimer and the Possible Role of (Dr. B. Stevens and E. Hutton), 1045
Dimers and Hexamers (Insulin) : Symmetry of (Prof. Barbara W. Low and J. Ralph Einstein), 470
αω-Dimethanesulphonoxyalkanes : Optical Properties of the (Dr. A. C. Bishop and Dr. R. D. Marshall), 74
Dimethyl Siloxane Polymers · Proton Magnetic Resonance in a Series of—a Specific Long-Chain ? (Dr. J. G. Powles and A Hartland), 26
Dimond, A. E. (edited by J. G Horsfall and) Plant Pathology, an Advanced Treatise, Vol. I, The Diseased Plant, *review* by W C. Moore, 47
Dinesen, A. (Brotzen, F , and) : On the Stratigraphy of some Bottom Sections from the Central Pacific (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 10, Special Investigations, No. 4), 609
Dingle, Prof. Herbert · Modern Philosophy of Science, *review*, 503
Dingle, J. T , and others : Synovial Proliferation induced by Polysaccharides, 251
2,4-Dinitrophenol : Effect of Thyroxine and, on Levels of Ubiquinone and Ubichromenol in the Rat (E. E. Edwin, J. Green, A. T. Diplock and J. Bunyan), 725
Dintenfass, L. : Visco-Elastic Systems (Rheological Classification of Suspensions), 943
Dinucleotide (Nicotinic Acid Adenine) Excretion of Nicotinic Acid and, by Biotin-deficient Yeast (Dr. Anthony H. Rose), 139
Dioscorea Saponin Smilagenone and *Epi*-Smilagenin from (D. Chakravarti, Prof. R N Chakravarti and M N Mitra), 236
Dioxide (Carbon), and in Carbon Monoxide Oxidation of Beryllium in (Dr S J. Gregg, Dr R J Hussey and Dr. W B Jepson), 468
Dioxide (Carbon) Gas . Formation of Beryllium Carbide during the Corrosion of Beryllium in Carbon Monoxide and in (V. D. Scott), 466
Dipeptidase Activity of Brain (L. Lahut Uzman, Marilynn K Rumley and Stanley van den Noort), 559
Diphenylamine Effect of, on the Synthesis of Carotene (Gy. Schneider, Dr. B. Matkovics, J Zsolt and Ó Kovács), 235
Diphenylphenylenediamine . Maintenance of α-Ketoglutarate and Succinate Oxidation in E-Deficient Liver Homogenates by α-Tocopherol, a Tocopherol Metabolite, Menadione and (Dr Laurence M. Corwin and Dr. Klaus Schwarz), 1048
Diplock, A. T., and others : Ubiquinones and Ubichromenols in the Rat, 554
  Effect of Thyroxine and 2,4-Dinitrophenol on Levels of Ubiquinone and Ubichromenol in the Rat, 725
Diploid-like Meiotic Behaviour of Wheat : Position of the Gene determining the (Dr. Ralph Riley, Victor Chapman and Gordon Kimber), 259
Dirac's Cosmology and the Origin of the Solar System (Prof. L. Egyed), 621
Direct Current Signals : Transistor Modulators for Low-level (J. F. Evans), 626
Direct Entry into First Degree Courses in the Faculty of Science : Report of an Enquiry into the Suitability of the General Certificate of Education Advanced Level Syllabuses in Science as a Preparation for (University of Birmingham), 687
Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes— (Prof. S. Rapoport and D. Scheuch), 967
Directory of Radioisotopes · International, Vol. I, Unprocessed and Processed Radioisotope Preparations and Special Radiation Sources ; Vol. 2, Compounds of Carbon-14, Hydrogen-3, Iodine-131, Phosphorus-32 and Sulphur-35 (International Atomic Energy Agency), 282
Discharge (Gas) : Reaction between Copper and Solid Oxygen condensed at Very Low Temperatures from a (Jerome Kruger and William J. Ambs), 794
Discharge (Gas) Harmonic Generator : Coherence and Band-width of a (N. R Bierrum, D. Walsh and J. C. Vokes), 626
Discharge (Linear Pinched) : Growth of Surface Instabilities in a (Dr. R. Latham, J. A. Nation, F. L. Curzon and Dr A Folkierski), 624
Discharge (Sewage Effluent) : Effect of a, on the Deposition of Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith), (R. W Edwards and J. Heywood), 492
Discrimination of Polarized Light by *Octopus* (The Visual System of *Octopus*), (M. F. Moody and J R Parriss), 839
Discrimination (Form) : Regularities in the Retina and Optic Lobes of *Octopus* in relation to (The Visual System of *Octopus*), (Prof. J Z. Young), 836
Discrimination (Shape), in *Octopus* : Theories of (The Visual System of *Octopus*), (Dr. N. S. Sutherland), 840
Disease : Monkeys and, *review* by Dr C. R. Coid, 506
  Nature and Exploitation of Crop Plant Resistance to (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Disease (Foot-and-Mouth) : Influence of Route of Inoculation and Strain of Mouse on Infectivity Titrations of the Virus of (Wendy Heatley, H. H. Skinner and H. Subak-Sharpe), 909
Disease (Parabiotic) : Graft versus Host Reaction in (Dr. B. Nakič, Z. Nakič and V Silobrčič), 322
Diseased Plant : The (Plant Pathology, an Advanced Treatise, edited by J. G. Horsfall and A. E Dimond, Vol. I), *review* by W. C Moore, 47
Diseases of Farm Crops (A. Beaumont), *review* by J. M. Hirst, 65
Diseases of Laboratory Primates (Prof. Theodore C. Ruch), *review* by Dr. C. R. Coid, 506
Diseases (Infective) · The Aetiology of (Prof Reginald Lovell), *review* by Dr. G. Lapage, 581
  Factors and Causes of, *review* by Dr. G. Lapage, 581
Dislocations beneath a Surface Film : Piling-up of (A. R C. Westwood and L. J. Demer), 146
Disorder (Memory) : Dichotic Stimulation and (Prof. James Inglis), 181
Dispersal by Flight : A Basis for a General System of Insect Migration and (C. G. Johnson), 348
Disproportionation and Dimerization of the Benzyloxyl Free Radical in Solution (Dr J. B de Sousa and S. K. Ho), 776
Dissection (Micro-) : Collagenase Maceration of Kidney for (Nancy J. Hayward), 403
Dissociation of Two Types of Immunity : Non-Specific Tolerance of Graft and the (Dr. Milan Hašek and Dr. Jan Hort), 985
Dissociation (Flavin), and Inactivation of Cytochrome b_5 by Oxygen (A New Type of Autoxidation Reaction), (J McD. Armstrong, Dr. J. H. Coates and Prof. R. K. Morton), 1033
Dissociation Constant (Acidic), of Alcoholic Hydroxyls of Oxycarboxylic Acids—Mandelic Acid (Dr. M. T. Beck and M. Halmos), 388
Distance Scale : The Extragalactic (Paul W. Hodge), 622
Distant Nuclear Test Explosions : Radioactivity of the Atmosphere due to (D. H Peirson, R. N. Crooks and E. M. R. Fisher), 224
Distensible Vessels (Tapered), Reflexions, and the Hosie Phenomenon : Pulsatile Flow through (Robert L. Evans), 290

Distillation · Preparation of Tritiated Water Samples by (J. D. Simpson and Dr J. R Greening), 467
Distinct (Metabolically) Classes of Ribonucleic Acids in Animal Cells: Fractionation of Two, and its Bearings on Cancer (Prof A. Sibatani, K. Yamana, K. Kimura and T Takahashi), 215
Distribution of Chromactivating Hormones in the Pituitary of the Minnow (A. K Kent), 395
Distribution (Binomial) · The Meaning of (A. W. F. Edwards), 1074
Distribution (Size), of Tobacco Smoke Droplets by a Replica Method (W. J. Harris), 537
Distribution (World), of ABO Blood Groups, *review* by Dr. F. Stratton, 581
Distribution-Free Interpretation of Spray-Drop Data (John B. Opfell), 822
Distribution Space of Glucose in the Dog Abrupt and Delayed Effects of Insulin on the (Dr G. Hetenyi, jun, and Prof. G A. Wrenshall), 808
Distribution and Form of Sponges · Influence of Environment on the (Prof M. A. Ali), 177
Distribution and Prevalence of *Fusarium moniliforme* Sheld. (*Gibberella fujikuroi* (Saw) Wr) producing Substances with Gibberellin-like Biological Properties (Prof. W. L. Gordon), 698
Distributions (Intensity), in the N_2 Lyman–Birge–Hopfield and CO Fourth Positive Band Systems Interpretation of (Prof R W Nicholls), 958
Disulphide Groups: A Role for Thiol and, in Determining the Rheological Properties of Dough made from Wheaten Flour (R Frater, Dr. F. J R Hird, H J Moss and J R. Yates), 451
Ditchburn, Prof R. W. New Physics Laboratory of the University of Reading, 768
Dittmer, Dorothy S (edited by): Handbook of Toxicology, Vol 5, Fungicides (analysis and compilation by Everett F. Davis, Barbara L. Tuma and Lucy C. Lee), *review*, 64
Diurnal Temperature Variation in the Rhesus Monkey under Normal and Experimental Conditions (Dr Lloyd B. Erikson), 83
Divergence between Lethal Doses and Sterilizing Doses of X-Rays with Progressive Development in *Habrobracon* Females (Dr. Howard E. Erdman), 254
Diversity of Trends in Medicine, *review* by Prof L J. Witts, 42
Dixon, J M S · Fate of Bacteria in the Small Intestine, 521
Dixon, Dr Malcolm, and others: A New Type of Autoxidation Reaction—Cause of the Instability of Cytochrome *c* Reductase, 1032
Dlouhá, H. (Nováková, V, and): Effect of Severing the Olfactory Bulbs on the Intake and Excretion of Water in the Rat, 638
Dobzhansky, Prof. Th. (Wallace, Prof. Bruce, and): Radiation, Genes and Man, *review* by Dr. A. G Searle, 109

Effect of S-β-Aminoethyl*iso*thiouronium Bromide Hydrobromide on X-Ray Damage to Guinea Pig Skin (Dr. J B Walter and Prof D. Slome), 177
Effect of Antibody and Complement on Volume Control in an Ascites Tumour Cell (Dr. H. Green and Dr. F. Silverblatt), 646
Effect of Carrier Gas on the Sensitivity of Thermal Conductivity Detectors (C Bokhoven and A Dijkstra), 793
Effect of Cathode Surface Roughness and Oxidation on Arc Movement (Dr. T. J. Lewis and Dr P. E. Secker), 30
Effect of Centrifugation on the Macronucleus of *Spirostomum* and *Blepharisma* (Prof. B. R Seshachar), 333
Effect of Curare on Conduction in Myelinated, Isolated Nerve Fibres of the Frog (Dr. Wolf D Dettbarn), 891
Effect of 'Degranol' on it : Heterogeneity of Tumour Ribonucleic Acid and the (F. Antoni, E. J Hidvégi and K. Lapis), 81
Effect of Denervation on Potassium-42 Uptake by the Rat Muscle *in vitro* (Dr. Z. Drahota and O. Hudlická), 396
Effect of Diphenylamine on the Synthesis of Carotene (Gy. Schneider, Dr. B. Matkovics, J Zsolt and O. Kovács), 235
Effect of Electrical Stimulation on a Muscle Fibre Model in the Presence of Adenosine Triphosphate (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat · Histophotometrical Study of the (S. L Liu), 475
Effect of Manganese Edetate on Blood Formation in Rats (T. J Sullivan), 87
Effect of Methylpentynol on Acetylcholine in the Rat's Brain (Giancarlo Pepeu and Prof. Nicholas J. Giarman), 638
Effect of Moisture on Carboxylic Acid Adsorption to Steel (M. E. Schrader and J. L. Kalinsky), 710
Effect of Molecular Structure upon Concentration of Hydrocarbons in 'Painted' Mouse Skin (Mary Burnham and Fred G. Bock), 323
Effect of Oxygen on the Inactivation of Trypsin by Ionizing Radiation (Prof. J. A. V Butler and Dr. A. B. Robins), 697
Effect of Oxygen on the Radiosensitivity of Bacteriophage in the Presence of Sulphydryl Compounds (Dr P. Howard-Flanders), 485
Effect of Oxygen and Nitric Oxide on the Radiosensitivity of Human Cells in Tissue Culture (Dr. D. L Dewey), 780
Effect of pH on Biological Activity of Pregnant Mare Serum Gonadotropin (Bengt H. Persson and Stig E. J. Melander), 163
Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of Isolated Rat Liver Mitochondria (C. N. Graymore, A. H. Melhuish and A. L. Greenbaum), 392
Effect of Relative Humidity on Hatching and on Toxicity of Ovicides to Eggs of the Red Spider Mite, *Tetranychus telarius* (L.) (Acarina : Tetranychidae), (R. A Harrison and A. G. Smith), 409
Effect of a Second Crystalline Modification in Polyethylene on X-Ray Crystallinity Measurements (Dr C G. Vonk), 962
Effect of Severing the Olfactory Bulbs on the Intake and Excretion of Water in the Rat (V. Nováková and H Dlouhá), 638
Effect of a Sewage Effluent Discharge on the Deposition of Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith), (R. W. Edwards and J. Heywood), 492
Effect of Solvent Polarizability on the Ultra-violet Spectral Shifts of Aromatic Compounds (Dr. F. A. Bovey and S. S. Yanari), 1042
Effect of Sub-Zero Temperatures on Diapause Eggs of *Acheta commodus* (Walk.), (T. W. Hogan), 98
Effect of Supernatant Potassium-Level on Cardiac Activity in Quantitative Tissue Culture (Prof. A W. B. Cunningham, K. Kleutch and W. Herbst), 241
Effect of Temperature on Growth in Weight and Tail-length of Inbred and Hybrid Mice (Prof S. C. Harland), 446
Effect of Temperature on the Hibernation of the European Corn Borer (Stanley D. Beck), 774
Effect of Thyroxine and 2,4-Dinitrophenol on Levels of Ubiquinone and Ubichromenol in the Rat (E. E. Edwin, J. Green, A. T. Diplock and J. Bunyan), 725
Effect of Vitamin A on the Cystine Content in Skin of Rats (Prof. Tatsuo Koyanagi and Satoru Odagiri), 809
Effect of X-Rays on the Development of the Infective Larvae of *Oesophagostomum radiatum* (Rud. 1803) (Strongylidae : Nematoda), (R. F. Riek and R. K. Keith), 981
Effect (Antioxidative), of Amino-Acids (Dr. Reinhard Marcuse), 886
Effect (Blocking), of Tetrahydroaminacrin on a New Psychotomimetic Agent (Dr. Samuel Gershon), 1072
Effect (Faraday), in the Transmissions from Fast Spinning Satellites (R. S. Roger and J. H. Thomson), 622
Effect (Kirkendall) : Analogy to the, in the Gas Phase (L. Miller and P. C. Carman), 549
Effect (Long-Chain) ? : Proton Magnetic Resonance in a Series of Dimethyl Siloxane Polymers—a Specific (Dr. J. G. Powles and A. Hartland), 26
Effect (Radiation) : Mechanism of the, on the Synthesis of Deoxyribonucleic Acid (Dr. R. J. Berry, E. Hell, Dr. L. G. Lajtha and Dr. M. Ebert), 563
Effect (A Trace Element), in Alloys based on the Aluminium–Zinc–Magnesium System (I. J. Polmear), 303

Effects of Chloramphenicol on the Recovery of Ultra-violet-irradiated *Escherichia coli B* (H. Okagaki and Prof. A. Sibatani), 818
Effects of 1,4-Dihydrazinophthalazine on the Catechol Amines (M. Bygdeman and L. Stjarne), 82
Effects of Fatty Acids on the ^{32}P-Adenosine Triphosphate Exchange Reaction in Rat Liver Mitochondria (K. Ahmed and Dr. P G. Scholefield), 1046
Effects of *Gibberella fujikuroi* on Fungal Root-Infections of *Pinus* (Dr. Ida Levisohn), 987
Effects of Injection of Bovine Pineal Extract on the Nuclei of Rat Pineal Parenchymal Cells (Dr Uno Holmgren, Dr. Mark D. Altschule and Dr Richard J. Wurtman), 393
Effects of Non-Ionic Surfactants upon Animal Tissues (Helen Goldhammer and W R. McManus), 317
Effects of Radiation of Human Heredity, 125
Effects (Abrupt and Delayed), of Insulin on the Distribution Space of Glucose in the Dog (Dr G Hetenyi, jun., and Prof G. A. Wrenshall), 808
Effects (Cardiovascular), of Nicotine and of Smoking (New York Academy of Sciences Symposium on), 525
Effects (Catalytic), in the Alkaline Oxidation of Cellulose (Dr. W. A. Bell), 963
Effects (Chemical), of Ionizing Radiation on Deoxyribonucleic Acid in Dilute Aqueous Solution (G. Hems), 710
Effects (Ionospheric), associated with the Solar Flare of July 10, 1959 (V. A. H. Harrison), 228
Effects (Quantum), on a Macroscopic Scale, *review* by Dr. J G. Valatin, 345
Effects (Some), of Different Tensions of Oxygen on the Respiration and Growth of *L*-Strain Fibroblasts (A R. Fisher), 315
Effects (Stimulating), of Nuclear Radiations on Development and Productivity of Rice Plants (Dr. Maung Mya Thaung), 982
Efficiency (Anthelmintic), of Tetrachlorodifluoroethane against *Fasciola hepatica* in Sheep (J. C. Boray and I. G Pearson), 252
Effluent Discharge (Sewage): Effect of a, on the Deposition of Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith), (R. W. Edwards and J. Heywood), 492
Effluents (Trade): Water Pollution by, 210
Efford, I E.: Appointed by the Royal Society to a John Murray Travelling Studentship in Oceanography and Limnology, 127

Electron Transfer Reactions involving *s*-Trinitrobenzene (Dr. R. E Miller and Prof W. F. K. Wynne-Jones), 149
Electronic Computers in Population Genetics (W F. Bodmer), 851; (J. L. Crosby), 851
Electronic Engineers: New Instruments for, 852
Electronic Structure of Molecules, *review* by Prof C. A. Coulson, 54
Electronics: Medical (Electronics and Communications Section of the Institution of Electrical Engineers and the International Federation for Medical Electronics International Conference on, and associated Exhibition), 523
  Nuclear—Proceedings of the International Symposium on Nuclear Electronics organized by the French Society of Radioelectricians, (Sessions 1-5), *review* by W Abson, 583
Electronics, Institute of: Annual Electronics and Instruments Exhibition and Convention, 685
Electronics (Medical), International Federation for (Electronics and Communications Section of the Institution of Electrical Engineers and the): International Conference on Medical Electronics, and associated Exhibition, 523
Electronics (Solid State), No 1, 850
Electronics and Control, Journal of, Vol. 4, 685
Electronics and Instruments Exhibition and Convention: Annual (Institution of Electronics), 685
Electrons (Self-trapped) ('Polarons'): Primary Processes in the Action of Ionizing Radiations on Water—Formation and Reactivity of (Prof. Joseph Weiss), 751
Electrophoresis (Agar-gel): Variations in Electrophoretic Position of Haptoglobin Mixtures in (Dr. Jan Hirschfeld), 894
Electrophoresis (Micro-) of Human White Cells and Platelets (Dr. William P. Creger and Phyllis Menna Thomas), 171
Electrophoresis (Starch-gel): Separation of the α- and β-Chains of Globins by means of (C. J. Muller), 643
Electrophoresis (Starch–Agar-Gel), of Tuberculoproteins from Heated Culture Filtrates (T. P. Dekker), 392
Electrophoretic Components of the Proteins in Honeybee Larval Food (N. G. Patel, M H. Haydak and T. A Gochnauer), 633
Electrophoretic Demonstration (Agar-gel), of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera (Dr. Jan Hirschfeld), 321
Electrophoretic Medium (A New), and its Application to the Resolution of Human Haemoglobin Variants (Dr. E. R. Huehns and Dr. A. O. Jakubovic), 729
Electrophoretic Position of Haptoglobin Mixtures: Variations in, in Agar-gel Electrophoresis (Dr. Jan Hirschfeld), 894
Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera: Agar-gel Electrophoretic Demonstration of Individual Variations in (Dr. Jan Hirschfeld), 321
Electroreduction of the Complexes of the Type $[M(NH_3)_5X]^{n+}$: Mechanism of the (Prof George W. Watt and Joe W. Vaughn), 309
Element (The Human), in Research Management (Dr. B. E Noltingk), *review* by E. S. Hiscocks, 579
Element (Trace) Effect in Alloys based on the Aluminium–Zinc–Magnesium System (I. J. Polmear), 303
Elementary Particles: Mass of (Dr S. E. Hornig), 708
Elementary Statistics with Applications in Medicine and the Biological Sciences (Prof Frederick E. Croxton), *review* by R. M. Cormack, 746
Elements: Periodic Classification of (W. P. Thistlethwaite), 153; (L. M. Simmons), 154, (A. A. Clifford), 154
  Radiochemistry of the, 602
Elements (Genetic): Structure and Function of—Report of Symposium held June 1959 (Brookhaven Symposia in Biology, No. 12), *review* by Prof. S. C Harland, 63
Elements (Minor), in Nutrition (Nutrition Society Symposium on), 939
Elements (Rare-Earth), Lanthanum to Lutetium, in Chondritic Meteorites: Abundances of the (Dr. R. A. Schmitt, A. W. Mosen, C. S. Suffredini, J E. Lasch, Dr. R. A. Sharp and D. A. Olehy), 863
Elevated Temperature: Sex Difference in Accidental Mortality of Guppies exposed to (Prof. John A. Freeman), 491
Elevation of Serum Haptoglobin in Rabbits in Response to Experimental Inflammation (R. K. Murray and G. E. Connell), 86
Elimination (Selective), of Single Sense Cells with Methylene Blue (Dr. Ulrich Clever), 812
Elizabeth the Queen Mother, H.M. Queen: To open the Brunswick Square building of the School of Pharmacy, University of London, 284
Elkind, Dr. M. M, and others: The Sigmoid Survival Curve in Radiobiology, 1062
Elliot, Dr. H.: Cosmic Ray Intensity in Interplanetary Space, 299
Elliott, Daphne C, and others (edited by): Data for Biochemical Research, *review* by Dr. K. S. Dodgson, 50
Elliott, W. H., and others (edited by): Data for Biochemical Research, *review* by Dr. K S Dodgson, 50
Ellis, G. R. A.: Observations of Atmospheric Radio Noise, 229
Ellis, J. A. (Leatherman, Gerald H., and): Fluoridation of Drinking Water, 438
Ellis, J. R.: Appointed professor of automobile engineering and first director of the Advanced School of Automobile Engineering at Cranfield, 762; work of, 762
Ellison, Prof. M. A.: The Sun and its Influence, second edition, *review* by Prof. C. W. Allen, 69

Elminius modestus Darwin in South-West Scotland (H Barnes and Margaret Barnes), 989
Elmore, Dr. D T. : Sterols and Terpenes, *review*, 745
Elton, Dr. L. R B. : Introductory Nuclear Theory, *review* by Dr. T. E. Allibone, 917
Elvin, Prof H. L. . Education in Sociology, *review*, 420
Embedding Media for Preparation of Ultra-Thin Sections Water-Soluble Methacrylates as (Dr O Wichterle, Dr P. Bartl and Dr. M. Rosenberg), 494
Embryo (Chick) Loss of Specificity on Passage of Immunologically Competent Cells in the (Sir Macfarlane Burnet and Georgiana Boyer), 175
Embryo (X-Irradiated) Synthesis of Contractile Proteins in the (Dr. Yoshito Ogawa), 77
Embryos of the Australian Cattle Tick Sulphydryl Content of the (W. J. Roulston and C. A. Schuntner), 1069
Embryos (Triploid Rat), and other Chromosomal Deviants after Colchicine Treatment and Polyspermy (L. Piko and O. Bomsel-Helmreich), 737
Emerson, W. W : Complexes of Calcium–Montmorillonite with Polymers, 573
Emin, I. (edited by) Russian–English Glossary of Solid State Physics, *review* by Prof S I Tomkeieff, 347
Emission (Photo-stimulated), of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide (J Wawrzyniak and Dr B. Sujak), 467
Emission (Solar Radio), and Polar Cap Absorption of Cosmic Noise · A Relation between (Dr. M. R Kundu and Prof F T Haddock), 610
Emission (X-Ray) Solar Limb Surges accompanied by (Dr. J Kleczek and Dr L Křivsky), 1035
Emmelot, Dr P , and others · Swelling of Fresh and Aged Liver Mitochondria as affected by Succinate, Adenine Nucleotides and Thyroxine, 556
Empire · The End of (John Strachey), 501
Emplacement of Granites · Age of (Dr. W Compston, Dr. P. M. Jeffery and G H Riley), 702
Employment of Women in Britain, 365
Emulsion Mosaics (Photographic) : Spectroscopic Applications of (Prof R. W Nicholls), 715
Encapsulated *Staphylococcus aureus* . Isolation of a Phagocytosis-inhibiting Substance from Culture Filtrates of an (Dr. Stephen I Morse), 102
Encephalomyocarditis Virus Particles Crystallization of Purified Mouse (P. Faulkner, E M. Martin, S. Sved and Dr T Work), 908
Enchytraeid Annelid : Monoxenic Cultivation of an (Dr. Ellsworth C. Dougherty and Bjørn Solberg), 1067
End of Empire (John Strachey), 501
Endocrine Control of Sexual Reproduction in *Opalina ranarum* Parasitic in *Rana temporaria* (Dr. M El Mofty and Prof. J D Smyth), 559
Endocrinology : International Congress of, 523
Energy Band Interpolation Scheme, with Application to Body-centred Cubic Lithium (J F. Cornwell and Dr. E. P. Wohlfarth), 379
Energy Transfer Processes · Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in (Dr B. Stevens and E. Hutton), 1045
Energy (Low-) Nuclear Physics, *review* by Dr. E. Bretscher, 58
Engineering Textile, *review* by Prof C. S Whewell, 189
Engineering in American Industry Science and—Report of a 1956 Survey (United States National Science Foundation), 763
Engineering (Automobile), Advanced School of (Cranfield) : Appointment of J. R. Ellis as professor of automobile engineering and first director, 762
Engineering (Biological) Society : Inauguration of the, 1019
  Election of Officers, 1019
Engineering (Chemical), at Birmingham, 849
Engineering (Chemical), at Nottingham, 933
Engineering (Chemical) : Education and Training in (Supplement to Chemical Engineering, a Career), (Institution of Chemical Engineers), 125
  Scholarships in (John Brown, Ltd , and the Institution of Chemical Engineers), 522
Engineering (Electrical), at Cambridge, 680
Engineering (Illuminating) Society : Summer Meeting, 206
Engineering (Mechanical), at Manchester, 1015
Engineering (Textile) Processes (edited by Prof. A H. Nissan), *review* by Prof. C. S Whewell, 189
Engineers (Agricultural), Institution of : Bursaries and a Scholarship, 284
Engineers (Chemical), Institution of : Education and Training in Chemical Engineering (Supplement to Chemical Engineering, a Career), 125
Engineers (Chemical), Institution of (John Brown, Ltd , and the) · Scholarships in Chemical Engineering, 522
Engineers (Electrical), Institution of (Electronics and Communications Section), and the International Federation for Medical Electronics : International Conference on Medical Electronics, and associated Exhibition, 523
Engineers (Electronic) : New Instruments for, 852
Engineers (Mining), Institute of : Summer Meeting, 127
English Language : Letter Structure of the (A. D. Baddeley, R. Conrad and W. E Thomson), 414
Enhanced Resistance of Mice to Infection with *Pasteurella pestis* following Vaccination with Fractions of Phenol-killed Tubercle Bacilli (Prof. David W Weiss), 1060
Enhancement of Peroxidase Action by Polysaccharides (Dr. B. Z. Siegel and Dr. S. M Siegel), 391
Enhancement of Staphylococcal Virulence for Mice by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin (Dr. Daniel Amsterdam and Dr. S. Stanley Schneierson), 101
Enstatite Chondrites : Silicon in the Metal Phase of (A E. Ringwood), 465
Entomological Conference : Seventh Commonwealth (Commonwealth Institute of Entomology), 603
Entomology : International Congress of, 938
Entomology, Commonwealth Institute of : Seventh Commonwealth Entomological Conference, 603
Entropies (Heats and), of Reaction of Transition Metal Ions with Ethylenediamine (M. Ciampolini, P. Paoletti and Prof L Sacconi), 880
Environment : Influence of, on the Distribution and Form of Sponges (Prof M A. Ali), 177
Environmental Demands · Sensory Specialization in Response to (Zoological Society Symposium on), 688
Environmental Determination of Sex in a Parthenogenetic Parasite (F. Wilson and L. T. Woolcock), 99
Environmental Temperature Oxygen Consumption in Cattle in relation to Rate of Increase in (Prof. H. H. Kibler), 972
Enzymatic Deamination of 5-Deoxycytidylic Acid and of 5-Methyl-5'-deoxycytidylic Acid in Growing and in Non-growing Tissues (Dr. Eduardo Scarano, Massimo Talarico, Luisa Bonaduce and Benita De Petrocellis), 237
Enzyme (Dry) A Connexion between S–S Bond Breakage and Inactivation by Radiation of a (Dilip K Ray, Dr Franklin Hutchinson and H J. Morowitz), 312
Enzyme Status in Intact Cells : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the (Prof S Rapoport and D. Scheuch), 967
Enzymes—Lectures held at the Conference on Enzymes and their Action, Wageningen, 1959, *review* by Prof J Brachet, 267
Enzymic Basis for Pathogenic Specificity (Elizabeth M C Turner), 325
Enzymic Oxidation of Stilboestrol labelled with Carbon-14 (P H Jellinck), 157
Enzymic (Non-) Reactions of Indoles with Coenzyme I (Prof S G. A. Alivisatos, G A. Mourkides and A. Jibril), 718
Enzymology Modern Trends in, *review* by Prof. J Brachet, 267
Epi-Smilagenin from *Dioscorea* Saponin : Smilagenone and (D Chakravarti, Prof. R N Chakravarti and M N Mitra), 236
Epps, F. J : South-Eastern Union of Scientific Societies, 770
Equation of State (A Monte Carlo), for Mixtures of Hard-Sphere Molecules (E. B. Smith and K R. Lea), 714
Equator Regular Micropulsations of the Earth's Field at the (Rosemary Hutton), 955
Equatorial Pacific (Central) . X-Ray Determination of Phillipsite in a Sediment Core from the (F Lippman), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 3), 609
Equilibria (Biological), in Human Cancer (Dr. Kenneth W Starr), 1006
Equilibrium of Celestial Bodies Figures of, with Emphasis on Problems of Motion of Artificial Satellites (Prof. Zdenek Kopal), *review* by D G. King-Hele, 747
Equilibrium (Non-) Theory of Gas–Liquid Chromatography (Dr. M. A. Khan), 800
Equilibrium (Oxygen), of Haemoglobin from *Thunnus thynnus* (Prof A. Rossi-Fanelli and E Antonini), 895
Equilibrium (Oxygen), of Myoglobin from *Thunnus thynnus* (Prof A. Rossi-Fanelli, E. Antonini and R Giuffrè), 896
Equivalence of Light and Adenosine Triphosphate in Bacterial Photosynthesis (Dr. M. Losada, Dr. A. V. Trebst, S Ogata and Prof. Daniel I. Arnon), 753
'Equivalent Redox Potential' · Significance of the, in Aqueous Solutions under Ionizing Radiation (Dr G. H. Cartledge), 370
Era · The Pleistocene, *review* by D F. W. Baden-Powell, 833
Erdman, Dr Howard E. Divergence between Lethal Doses and Sterilizing Doses of X-Rays with Progressive Development in *Habrobracon* Females, 254
Ergot : Milk-ejecting Action of (Prof Ranjit Roy Chaudhury and Mandakini B. Dikshit), 722
Erickson, Charlotte · British Industrialists—Steel and Hosiery, 1850-1950, *review* by R. Brightman, 347
Eriksen, N , and others . Vanadium Catalysis of the Oxidation of Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles, 884
Erikson, Dr. Lloyd B Diurnal Temperature Variation in the Rhesus Monkey under Normal and Experimental Conditions, 83
Error-correcting Group Codes A Systematic Method for the Construction of (Prof. R B. Banerji), 627
Erwinia amylovora . An Association between Capsulation and Phage Sensitivity in (Eve Billing), 819
Erythrocyte Contents of Chick Blood · Influence of Dietary Intake of certain Insecticides on the Haemoglobin and (Prof B K. Srivastava, H. C. Saxena and J C Sharma), 172
Erythrocytes : Differences in Numbers of, between Inbred Lines of Chickens (Dr. P. Jaffe), 978
Erythrocytes (Human) · Age Difference in Nicotinamide Mononucleotide Synthesis by (Dr. Vlastimil Habermann and Sona Habermannová), 389
Erythropoietine Production in the Dog (Dr. F. W. Kinard, F. F. Griffin, jun , and F. W Kinard, jun), 561
Esashi, —., and Nagao, —. : Factors affecting Tubers in *Begonia evansiana* Andr., 766
Escherichia coli T_1 and λ Phage Adsorption on Protoplast-like Bodies of (Dr P. H. Hofschneider), 568
Escherichia coli B · Effects of Chloramphenicol on the Recovery of Ultra-violet-irradiated (H Okagaki and Prof A. Sibatani), 818
Eskola, Dr P. : Orogens (Juvenile Granites produced by Intrusive Magmas), 690
Essay on Die Ruckkoppelung als Urprinzip der Lebensvorgange : Prize of 8,000 D. marks for an (Bayerische Akademie der Wissenschaften), 938
Essay Competition : Waverley Gold Medal (*Research*), 937
Essen, Dr. L. · Elected a Fellow of the Royal Society, 11
Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years (Prof. H. Fisher and A. S. Feigenbaum), 85
Essigsaure : Die Aktivierte (Dr Karl Decker), *review* by Prof. D. C. Harrison, 66
Estimate of the Peak Sunspot Number in 1968 (C. M. Minnis), 462
Estimated United Kingdom Power Output 1960-65, 122
Estimates, Select Committee on : Fifth Report from the, Session 1958-59, United Kingdom Atomic Energy Authority (Production Group and Development and Engineering Group), 1
Estimation of 3-Deoxy Sugars by means of the Malonaldehyde–Thiobarbituric Acid Reaction (Dr. Morris A. Cynkin and Dr. Gilbert Ashwell), 155
Estimation of a Facial Eczema Toxin, Sporidesmin Detection and (G R. Russell), 788
Estimation of Mouse Tumour Blood Volumes employing a Radioactive Isotope Technique (F. S. Stewart and Dr. A. E. G. Pearson), 250
Estimation (Histochemical) . Localization of Amino-acids for (Helen M. Notovny and Robert G Owens), 1057

Estuary (Stour) : Mud Fauna of the (Frances Bull, Helen Honeyman and Susan Knott), 1018
Ethology : Early, *review* by Dr R A Hinde, 43
Ethyl Iodide : Use of Solvents containing, in the Investigation of Phosphorescence Spectra of Organic Compounds (Dr. I J. Graham-Bryce and J M. Corkill), 965
Ethylene Production by Tomato and Apple Fruits (D. F. Meigh, K. H. Norris, C. C. Craft and M. Lieberman), 902
Ethylenediamine : Heats and Entropies of Reaction of Transition Metal Ions with (M. Ciampolini, P. Paoletti and Prof L. Sacconi), 880
Ethylenediamine with Noradrenaline or 3,4-Dihydroxymandelic Acid : Condensation Product of (Kunio Yagi, Toshiharu Nagatsu and Ikuko Nagatsu), 310
Eton College Natural History Society : Report, 282
Ettlinger, Dr. G. (Burton, D., and) : Cross-Modal Transfer of Training in Monkeys, 1071
l'Étude Agronomique du Congo Belge, Institut National pour . Flore du Congo Belge et du Ruanda-Urundi, Vol 9, 764
Europe : British Dyestuffs and Wider Co-operation in, 829
  Co-operative Research in, 520
European Barley Convention Ninth Annual Report of the Barley Committee, 16
European Calendar of Short Summer Courses (Bureau Européen de l'Education Populaire), 685
European Co-operation for Science, 600
European Corn Borer : Effect of Temperature on the Hibernation of the (Stanley D Beck), 774
European Economic Co-operation, Organization for : Seminar on the Status and Development of the Teaching of Chemistry, 208
  Seminar on Policy for School Science, 850
  Co-operation in the Field of Scientific and Technical Research, 998
European Economic Co-operation, Organization for, and the Scientific Future, 520
European Economic Co-operation, Organization for, and the United States National Science Foundation Award of Senior Visiting Fellowships in Science, 1019
European Organization for Nuclear Research (CERN) : Appointment of J B Adams as interim director-general, 523
  Personal library of the late Prof. Wolfgang Pauli transferred to the, 1017
European Organizations (Political and Economic Planning), 830
Evaluation of the Antibacterial Activity of Surface-Active Compounds : Methods for the (Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry Symposium on), 131, *erratum*, 206
Evans, Dr. D. G. : Elected a Fellow of the Royal Society, 11
Evans, J F. Transistor Modulators for Low-level Direct Current Signals, 626
Evans, Dr. P. R. V. Awarded the Andrew Carnegie Silver Medal for 1959 of the Iron and Steel Institute, 13
Evans, Robert L Pulsatile Flow through Tapered Distensible Vessels, Reflexions, and the Hosie Phenomenon, 290
Evans, Dr S, and Thomas, Dr. G M. : Results of the Royal Society's International Geophysical Year Expedition (Visual Work on Aurora), 192
Event of Aerial Contamination of Agricultural Land : An Assessment of the Quantities of Fission Products likely to be found in Milk in the (Dr R J. Garner), 1063
Everett, Prof D. H An Introduction to the Study of Chemical Thermodynamics, *review* by Prof A. R Ubbelohde, 55
Evidence of Concurrent Translocation (C. D. Nelson, H. J Perkins and P R. Gorham), 205
Evidence for the Existence of an Inner Zone : Geometry of the Southern Auroral Zone and the (Dr T Hatherton), 288
Evidence for a New Allele in the Kidd Blood Group System in Indians of Northern Mato Grosso, Brazil (Dr. Richard T. Silver, Jane M. Haber and Dr Aaron Kellner), 481
Evidence (Direct), for the Importance of Glutathione for the Enzyme Status in Intact Cells : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes— (Prof S Rapoport and D. Scheuch), 967
Evidence (Further), for the Dual Nature of the Third Component of Complement (Dr. J. D. Hawkins), 483
Evolution : The Eye in (Sir Stewart Duke-Elder), *review* by R C Davenport, 42
Evolution (Invertebrate) Exhibit of (Australian Museum), 438
Evolutionary Origin of Sexual Differentiation and the Sex-Ratio (Dr. H. Kalmus and Dr. C. A. B Smith), 1004
Ewe (Merino) Seasonal Differences in Ovulating Hormone in the (Dr. D. R Lamond), 971
Ewers, Wm H. Multiple Infections of Trematodes in a Snail, 990
Ewles, J, and Dawson, J B. Micromosaic Patterns in Single Crystals of Potassium Chloride containing Barium Chloride, 381
Examinations : The Lack of Thinking in (Dr. Margaret Sutherland), 607
Examinations of Core 72 and 723 (W. Dekeyser), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 10, Special Investigations, No. 2), 609
Excavations at La Venta, Tabasco, 1955 (Philip Drucker, Robert F. Heizer and Robert J Squier), 134
Exchange of Genetic Material—Mechanisms and Consequences (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 23), *review* by Prof. Kenneth Mather, 832
Exchange (Ligand), with its Metal Complex : Rate of, by a Polarimetric Method (B Bosnich, Dr. F. P. Dwyer and Dr. A M Sargeson), 966
Exchange Reaction (^{32}P-Adenosine Triphosphate), in Rat Liver Mitochondria . Effects of Fatty Acids on the (K Ahmed and Dr. P. G. Scholefield), 1046
Exchanger (Anion) : Fractionation of Heparin on an (Dr. J. P. Green), 472
Excited Dimers in Energy Transfer Processes : Radiative Life-time of the Pyrene Dimer and the Possible Role of (Dr. B. Stevens and E. Hutton), 1045
Excretion of Nicotinic Acid and Nicotinic Acid Adenine Dinucleotide by Biotin-deficient Yeast (Dr. Anthony H. Rose), 139
Excretion (Intake and), of Water in the Rat : Effect of Severing the Olfactory Bulbs on the (V. Nováková and H. Dlouhá), 638
Excretion (Urinary), of a Ninhydrin-positive Compound, probably a Peptide, after Administration of β-Aminoisobutyric Acid to the Mouse (Dr. James B Gilbert and Dr. Yuoh Ku), 160
Executive Health of the (Diagnostic Clinic of the Graduate School of Medicine, University of Pennsylvania, Medical Affairs, Vol. 1, No. 3), 765
Exhalation (Methane), in Sheep (E. Cresswell), 560
Exhibit of Invertebrate Evolution (Australian Museum), 438
Exhibition : Annual Electronics and Instruments, and Convention (Institution of Electronics), 685
  Tercentenary (Royal Society), 1016
Existence of an Inner Zone : Geometry of the Southern Auroral Zone and the Evidence for the (Dr. T. Hatherton), 288
Existence of Net Electric Charges on Stars (Prof V A Bailey), 508
Exo-electrons : Photo-stimulated Emission of, from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide (J Wawrzyniak and Dr. B. Sujak), 467
Expansion of University Education, 1960-1970 Memorandum to the University Grants Committee on the (National Union of Students), 687
Expedition . The New Zealand Antarctic (Sir Edmund Hillary), 526
Expedition (International Geophysical Year) : Results of the Royal Society's (Royal Society Discussion on), 191
Expenditure Industrial Research and Development, 1958 (Department of Scientific and Industrial Research), 997
Expenditure (United States), on Academic Research and Development, 1016
d'Expérience (Plans) : Analyse de Variance et (Prof Daniel Dugué et Prof Maurice Girault), *review* by Dr. D J Finney, 68
Experimental Biology at Rehovoth, 681
Experimental Cirrhosis : Histochemical and Biochemical Studies of Rat Liver in after Partial Hepatectomy (I. Bartók, Gy Domján, E. Horváth and Prof. B. Korpássy), 397
Experimental Conditions (Normal and) . Diurnal Temperature Variation in the Rhesus Monkey under (Dr Lloyd B Erikson), 83
Experimental Inflammation : Elevation of Serum Haptoglobin in Rabbits in Response to (R. K Murray and G. E. Connell), 86
Experimental Physics at Cambridge, 762
Experimental Production of Liver Cancer : Effect of 3-Amino-1,2,4-triazole on the (Munemitsu Hoshino), 174
Experimentally Induced Inter-bivalent Redistribution of Chiasmata in *Delphinium* (H K Jain and A K. Bose), 260
Experiments in the Field of Parametric Amplification (B Bollée and G. de Vries), 1019
Experiments (Animal) : Combined Application of Hydrogen Peroxide and Ionizing Rays in (E Fleischmann, H. Werkgartner and K. Karrer), 324
Experiments (Long-range Clock Synchronization) : Preliminary Flight Tests of an Atomic Clock in Preparation of (Friedrich H Reder and Gernot M R Winkler), 593
Explants of Brain Tissue in Culture : Spontaneous Potentials from (Prof. A W B. Cunningham, Marshall Dougherty and B. J. Rylander), 477
Exploitation of Crop Plant Resistance to Disease : Nature and (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Explorations of the Galápagos Islands (Dr. L Harrison Matthews), 365
Exploratory Behaviour in the Rat (Roger G A Stretch), 454
Explosion of Gases and Vapours : Flame and, *review* by Dr. H F. Coward, 666
Explosions : Radioactivity of the Atmosphere due to Distant Nuclear Test (D. H Peirson, R. N Crooks and E. M. R Fisher), 224
Explosions, Detonations, Flammability and Ignition Part 1 (Prof. S. S. Penner) ; Part 2 (B. P Mullins), *review* by Dr. H. F. Coward, 666
Explosives : Modern (the late Dr. Wilfrid Taylor), 204
Export : British Books for, 600
Exposure Ages for Iron Meteorites (Oliver A. Schaeffer and David E. Fisher), 1040
Extracellular χ-Phage of *Serratia* : Induction and Reversion of *c*-Mutations by Irradiation of the (Prof. R. W Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
Extracellular Unit Action Potentials from the Central Nervous System : 'Weightless' Micro-electrodes for Recording (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Extract (Bovine Pineal) : Effects of Injection of, on the Nuclei of Rat Pineal Parenchymal Cells (Dr. Uno Holmgren, Dr. Mark D Altschule and Dr. Richard J. Wurtman), 393
Extraction of Metals : Principles of the (Dr D J. G. Ives), 765
Extracts of *Azotobacter vinelandii* : Nitrogen Fixation in (Dr. D. J. D. Nicholas and D J Fisher), 735
Extracts (Alcoholic Plant) : An Ion-Exchange Resin Method for the Fractionation of (Dr. Dalwon Wang), 326
Extracts (Cardioactive Acetone), of Ox Spleen : Absence of Catecholamines in (Dr. L. B. Cobbin and Prof. R. H Thorp), 473
Extracts (Plant) . Treatment of Injured and Regenerating Muscles with (S. Hoja and J. Vittek), 283
Extragalactic Distance Scale (Paul W. Hodge), 622
Extreme Ultra-violet Radiation (Solar), as a Source of Interplanetary Ionization (Dr Hans E. Hinteregger), 523
Extreme Ultra-violet and Soft X-Rays : A Self-supporting Metal Fresnel Zone-plate to focus (Dr. Albert V. Baez), 958
Eye : The Biochemistry of the (Dr Antoinette Pirie), 352
Eye in Evolution (Sir Stewart Duke-Elder), *review* by R. C Davenport, 42
Eye and Vision, *review* by R. C. Davenport, 42
Eyles, A. G. : Nitrogen in Tropical Agriculture, 941
Eyles, Dr V A : Glossary of Geological Terms, *review*, 57
Eysenck, Prof. H. J. Dowsing—Fact or Fiction?, *review*, 346

FACIAL Eczema Toxin, Sporidesmin : Detection and Estimation of a (G. R. Russell), 788
Factor (Possible), in Sympatric Speciation : Selective Visits of Butterflies to Flowers—a (K. R. Dronamraju), 178
Factories : Structural Loading in (Department of Scientific and Industrial Research), 851
Factories (Ionizing Radiations) Special Regulations : Second Preliminary Draft of Regulations (Ministry of Labour), 13
Factors affecting Tubers in *Begonia evansiana* Andr. (— Esashi and —. Nagao), 766 ; (—. Nagao and —. Mitsui), 766

Factors (Recovery), in Rats receiving an Acute Whole-body Dose of X-Rays : Yeast Ribonucleic Acid and its Nucleotides as (Prof. J Maisin, P. Dumont and A. Dunjic), 487
Factors and Causes of Infective Diseases, *review* by Dr. G. Lapage, 581
Fagg, William : Grooved Rocks at Apoje, Nigeria, 205
Fairbairn, W. M. Ionization of *n*-Paraffin Molecules, 151
Fairbrother, Dr. R. W. : A Text-Book of Bacteriology, eighth edition, *review* by Dr. R H. Gorrill, 111
Falcon, N. L. : Elected a Fellow of the Royal Society, 11
Falkenbergia rufolanosa on the West Coast of Scotland : Occurrence of (Dr. Elsie Conway), 566
Fall-out (Radioactive), during 1959 (W. Anderson, R. E. Bentley, L. K. Burton, J. O. Crookall and C. A. Greatorex), 925
Fall-out Radioactivity in Southern Sweden (Prof Pontus Ljunggren), 655
Fallow : Red, Roe and, *review* by R. S. R. Fitter, 45
False-Positive Reactions (Bacterially Mediated), in Lytic Blood-Typing Tests (Prof. Clyde Stormont, Yoshiko Suzuki and W. J. Miller), 247
Family : The Free (Paul and Jean Ritter), *review* by Prof. M. D. Vernon, 38
Far East : The Dilemma of the, *review* by Prof W D. Borrie, 664
  Population and Progress in the (Prof. Warren S. Thompson), *review* by Prof. W. D. Borrie, 664
Faraday Effect in the Transmissions from Fast Spinning Satellites (R. S. Roger and J. H Thomson), 622
Faraday Rotation of Radio Signals from Artificial Satellites : Electron Density Measurements in the Upper Ionosphere using the (Dr. D. McL. A. Wilson), 623
Farm Animals : Feeding Antibiotics to (Agricultural Research Council and the Medical Research Council Joint Committee on), 280
Farm Crops : Diseases of (A. Beaumont), *review* by J. M. Hirst, 65
Farming (Profitable) : Fertilizers and (Dr. G. V. Cooke), *review* by G. V. Jacks, 424
Fasciola hepatica in Sheep : Anthelmintic Efficiency of Tetrachlorodifluoroethane against (J. C. Boray and I G Pearson), 252
Fast Spinning Satellites : Faraday Effect in the Transmissions from (R. S. Roger and J. H. Thomson), 622
Fate of Bacteria in the Small Intestine (J. M. S. Dixon), 521
Father : Dependence of the Sex Ratio at Birth on the Age of the (Dr. Leo Szilard), 649 ; (Dr. A. Comfort), 1065
Father of Chemistry : Robert Boyle— (Dr. Roger Pilkington), *review* by Dr. W. A. Smeaton, 63
Fats (Differently Saturated) : Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving, for Three Years (Prof. H. Fisher and A. S. Feigenbaum), 85
Fatty Acids : Effects of, on the ^{32}P-Adenosine Triphosphate Exchange Reaction in Rat Liver Mitochondria (K. Ahmed and Dr. P. G. Scholefield), 1046
Fatty Acids (Essential), of Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years (Prof. H. Fisher and A. S. Feigenbaum), 85
Faulkner, P., and others . Crystallization of Purified Mouse Encephalomyocarditis Virus Particles, 908
Fauna Preservation Society : Annual Report for 1959, 1017
Fauna (Late Precambrian), in South Australia (M. F. Glaessner and B. Daily), 205
Fauna (Mud), of the Stour Estuary (Frances Bull, Helen Honeyman and Susan Knott), 1018
Favejee, J. Ch. L. : Mineralogical Composition of some <2 Micron Fractions in a Sediment Core from the Mindanao Trough (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 5), 609
Fazekas de St. Groth, Dr. S. : Elected a Fellow of the Australian Academy of Science, 519
Features (Geological) . Influence of, on Very Low Frequency Geomagnetic Fluctuations (H. J. Duffus, J. A. Shand and Sir Charles Wright), 141
Federation of British Industries : Handbook on the Technical Colleges and their Government, 769
Federation of Malaya, Government of the, and others : International Conference on Natural Rubber Research, 767
Federation for Medical Electronics, International (Electronics and Communications Section of the Institution of Electrical Engineers and the) : International Conference on Medical Electronics, and associated Exhibition, 523
Federation of Rhodesia and Nyasaland : Government Organizations and Statutory Bodies concerned with Scientific Research and Technical Services in the, 202
Feeding Antibiotics to Farm Animals (Agricultural Research Council and the Medical Research Council Joint Committee on), 280
Feeding with Goitrogenous and Non-goitrogenous Cabbage : Level of Sulphydryl Compounds in Rat Liver following (Jozef Sedlák), 892
Feeding (Thyroid-Powder), and Liver Nitrogen in Mice (Dr. A. N. Granitsas, M. Kukku and M. Konstantinidu), 890
Feigenbaum, A. S. (Fisher, Prof H., and) : Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years, 85
Feldspar? : Do Meteorites exist Consisting Predominantly of (Prof. K. Przibram), 300
Fell, J. : Nuclear Reactor Physics, *review*, 78
Feller, Prof. W. : Elected a member of the United States National Academy of Sciences, 773
Fellowship : Research (Royal Geographical Society), 684
Fellowships (City and Guilds of London Institute), 13
  Carlsberg–Wellcome Travelling Research (Wellcome Trust), 283
  Lederle Medical Student Research (American Cyanamid Company), 283
  Senior Research (United States Public Health Service), 439
  Studentships and (Agricultural Research Council), 126
Fellowships for 1960 : André Mayer (Food and Agriculture Organization of the United Nations), 15
Fellowships for 1960-61 (Ciba Fellowship Trust Awards), 684
Fellowships in Animal Reproduction : Ford Research (Zoological Society of London), 519
Fellowships for Medical Research (Beit Memorial Trust Elections), 520
Fellowships (Graduate), for 1960-61 (United States National Science Foundation Awards), 684
Fellowships (Harkness), of the Commonwealth Fund (Elections for 1960), 15
Fellowships (Senior Visiting), in Science (Organization for European Economic Co-operation and the United States National Science Foundation Awards), 1019
Female (Unfertilized), of the Spider *Uloborus walckenaerius* Latrielle · Unusual Web Pattern made by an (Dr. Rasza Szlep), 94
Female *Glossina morsitans* : Determination of Physiological Age for (D. S. Saunders), 651
Females (*Habrobracon*) · Divergence between Lethal Doses and Sterilizing Doses of X-Rays with Progressive Development in (Dr Howard E. Erdman), 254
Fennah, R. G. : The Aradidae, *review*, 46
  Meyrick's Microlepidoptera, *review*, 188
Fensom, D. S. · Bio-electric Potentials of Plants, 853
Feral Goat Herd · Home Range in a (Thane Riney and Graeme Caughley), 125
Ferguson, Dr L. N. (Barnes, Dr. C. J , and) · Amino-Acid Composition of Proteins from Surface Tissue of the Tongue, 617
Fern (Male), in Pharmacognosy : Indian Substitutes of (Prof. P. N. Mehra and T. C. Mittal), 722
Fern Species : Purification of a Specific Inducer of the Male Sex Organ in certain (Ross B. Pringle, Ulrich Naf and Armin C. Braun), 1066
Ferrari, I. (Bottura, C., and) : A Simplified Method for the Study of Chromosomes in Man, 904
Ferritin and Apoferritin . X-Ray Diffraction Study of Denatured (Vladimír Kleinwächter), 313
Fertility of College Graduates (Population Reference Bureau, Inc., *Population Bulletin*, Vol 15, No. 6), 22
Fertility (Human) . Problems of, *review* by Dr. Kenneth Walker, 188
Fertility Problem (Human) . Modern Science and the (Dr. Richard L. Meier), *review* by Dr Kenneth Walker, 188
Fertilizers and Profitable Farming (Dr. G. W. Cooke), *review* by G. V. Jacks, 424
Feughelman, M. : Visco-Elastic Systems (Effect of Humidity on Stress Relaxation in Wool), 943
Feulgen Reaction : A New Technique for Studying the Quantitative Aspects of Cytochemical Reactions and its Application to the (P. van Duijn and J. -P. Persijn), 805
Fibre Model (Muscle), in the Presence of Adenosine Triphosphate : Effect of Electrical Stimulation on a (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Fibre Science (Textile Institute Conference on), 360
Fibre (Giant-) Reflex of the Earthworm (Dr. M. B. V. Roberts), 167
Fibre (Nerve) Myelin Sheath : Neurokeratin Network of the Peripheral, as a Centre of Metabolic Activity (Dr. H. B Tewari and Prof. Geoffrey H. Bourne), 645
Fibres (Myelinated, Isolated Nerve), of the Frog: Effect of Curare on Conduction in (Dr. Wolf D Dettbarn), 891
Fibres (Spruce Sulphite) · Structure of the Outer Secondary Wall on Unbleached (O. Kallmes and J. A S. Newman), 566
Fibres (Wool) : Supercontraction in, and Creep in the Post-yield Region (Dr. K. J Whiteley), 473
Fibrinogenolysis in Joints (A. J. Harrold), 1057
Fibroblasts (*L*-Strain) · Some Effects of Different Tensions of Oxygen on the Respiration and Growth of (A. R. Fisher), 315
Field of Parametric Amplification · Experiments in the (B. Boillé and G. de Vries), 1019
Field of Scientific and Technical Research : Co-operation in the (Organization for European Economic Co-operation), 998
Field Lines (Geomagnetic) : Motion of (C. J. Loughnan), 33
Field Manual (Laboratory and), of Ornithology (Olin Sewall Pettingill, Jr.) third edition, *review* by J D Macdonald, 65
Field Studies Council : Report for 1958-59, 203
Field Techniques (Practical), in Physical and Cultural Geography (Geographical Association Course in), 1020
Field and Store · Food Losses in (Nutrition Society Symposium on), 685
Fields, Joseph, and others : Synthetic Polyelectrolytes as Tumour Inhibitors, 778
Fields of Learning : The Problem of Language in Publications of Works in Scientific and other (Prof D Keilin), 912
Fieser, Prof. Louis F., and Fieser, Mary : Steroids, *review* by Dr. W. Klyne, 668
Fieser, Mary (Fieser, Prof. Louis F., and) : Steroids, *review* by Dr. W. Klyne, 668
Fifoot, E R. S. · Appointed University Librarian at the University of Edinburgh, 767
Figures of Equilibrium of Celestial Bodies, with Emphasis on Problems of Motion of Artificial Satellites (Prof. Zdenek Kopal), *review* by D. G. King-Hele, 747
Filamentous Structures in Ectromelia Virus-Infected Cells (Dr. Benjamin V. Siegel), 820
Fillings for Geiger-Muller Tubes : Helium–Butane Gas Mixtures as (Dr. V. Moses and Dr. J. F. Fowler), 538
Film in Teaching and Research in British Universities, 1959 : The Use of (British Universities Film Council), 444
Film (Surface) : Piling-up of Dislocations beneath a (A. R C. Westwood and L J. Demer), 146
Film Council (British Universities) : The Use of Film in Teaching and Research in British Universities (1959), 444
Film Strips in Teaching : Films and, 360
Films and Film Strips in Teaching, 360
Films (Thin), of Silver–Cadmium Alloy (K. Bahadur and P. V. Sastry), 467
Filtrates (Culture), of an Encapsulated *Staphylococcus aureus* : Isolation of a Phagocytosis-Inhibiting Substance from (Dr. Stephen I. Morse), 102
Filtrates (Heated Culture) · Starch—Agar-Gel Electrophoresis of Tuberculoproteins from (T. P. Dekker), 392
Filtrates (Serum) : Presence of Protein in some (Dr. F. J. Scandrett), 558
Finland's Institute of Technology : Scientific Researches No. 13, Traffic Accidents and Driver Characteristics (Sauli Häkkinen), 273
Finlay-Freundlich, E. : Celestial Mechanics, *review* by Dr. R. H. Garstang, 60
Finney, Dr. D. J. : Analyse de Variance et Plans d'Expérience, *review*, 68
Firsoff, V. A. : The Lunar Surface, 826
First Month of Life : Interrelation of Tryptophan and Nicotinic Acid in Man during the (S. Auricchio, E. Quagliariello and A. Rubino), 639
First Stage of Work Hardening in Aluminium Single Crystals (N. A McKinnon), 148

Firth, J. N. M. : Cleaning of Fossils by Ultrasonic Waves, 684
Fischbach, Dr. D. B. : High-Temperature Creep of Graphite, 795
Fischer, Dr. E., and others : Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia, 893
Fischer, Prof. G. : Orogens, 689
Fischer, G. W., and others (edited by) : Plant Pathology, Problems and Progress, 1908-1958, *review* by W. C. Moore, 47
Fish and Game, Department of (California) : Bulletin No. 107, Trout and Salmon Culture—Hatchery Methods (Earl Leitritz), 204
Fishel, Prof. C. W. : Mucopolysaccharides of Serum and Pleural Fluid, 804
Fisher, A R. : Some Effects of Different Tensions of Oxygen on the Respiration and Growth of *L*-Strain Fibroblasts, 315
Fisher, David E. (Schaeffer, Oliver A., and) · Exposure Ages for Iron Meteorites, 1040
Fisher, D. J. (Nicholas, Dr. D. J. D., and) : Nitrogen Fixation in Extracts of *Azotobacter vinelandii*, 735
Fisher, E. M. R., and others : Radioactivity of the Atmosphere due to Distant Nuclear Test Explosions, 224
Fisher, Prof. H., and Feigenbaum, A. S. Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years, 85
Fisher, H. D. (Mansfield, A. W., and) . Age Determination in the Harbour Seal, *Phoca vitulina* L., 92
Fisheries Advisory Committee (Colonial) · Report for 1958-59, 501
Fisheries Research in Australia, 280
Fishery Research : Postgraduate Training Grants in (Development Commissioners, the Ministry of Agriculture, Fisheries and Food, and the Scottish Home Department), 360
Fishery Research Station (Inland), Sagana, Kenya (Dr. Vernon D. van Someren), 425
Fisica, Società Italiana di : International School of Physics, 17
Fission Products : An Assessment of the Quantities of, likely to be found in Milk in the Event of Aerial Contamination of Agricultural Land (Dr. R. J. Garner), 1063
Fission Products in the Atmosphere : Detection of Recently Produced (Dr. W. Anderson, Dr. R. E. Bentley, L. K. Burton and Dr. C. A. Greatorex), 223
Fitter, R. S. R. : Red, Roe and Fallow, *review*, 45
Fitzgerald, F. : Decomposition of Methyl Acetylene, 386
Fixation (Nitrogen), in Extracts of *Azotobacter vinelandii* (Dr. D. J. D. Nicholas and D. J Fisher), 735
Fixation (Nitrogen), by a Legume : Cobalt in (Prof. H. M. Reisenauer), 375
Flagellate Spermatozoa : Position of the Proximal Centriole in (Prof. Vishwa Nath, Brij L. Gupta and L. C. Mittal), 899 ; (Dr. J. Bronte Gatenby and R. S Mathur), 900
Flame and Explosion of Gases and Vapours, *review* by Dr. H. F. Coward, 666
Flammability and Ignition : Explosions, Detonations, Part I (Prof. S. S. Penner), Part 2 (B. P. Mullins,) *review* by Dr. H. F. Coward, 666
Flare (Solar), of July 10, 1959 : Ionospheric Effects associated with the (V. A. H. Harrison), 228
Flavin Dissociation and Inactivation of Cytochrome b_2 by Oxygen (A New Type of Autoxidation Reaction), (J. McD. Armstrong, Dr. J. H. Coates and Prof. R. K. Morton), 1033
Flavonoid Compounds in the Inflorescence of *Helichrysum arenarium* (Z. I. Jerzmanowska and J. T. Grzybowska), 807
Flavonoids : Biosynthesis of (W. E. Hillis), 635
Fleischmann, E., and others : Combined Application of Hydrogen Peroxide and Ionizing Rays in Animal Experiments, 324
Flexner, Dr. Abraham · *Obituary* by Dr A N. Richards, 278
Flight : A Basis for a General System of Insect Migration and Dispersal by (C. G. Johnson), 348
  Man-powered (Financial grants from the Royal Aeronautical Society Man Powered Aircraft Group, for promising projects designed to further the achievement of), 1020
Flight (Space) : Problems of, *review* by D. G. King-Hele, 59
Flight Tests (Preliminary), of an Atomic Clock in Preparation of Long-range Clock Synchronization Experiments (Friedrich H. Reder and Gernot M. R. Winkler), 592
Flood, Dr. A. E. (Kirkham, Dr. D. S., and) : Nature and Exploitation of Crop Plant Resistance to Disease (Apple and Pear Scab), 858
Flora of the Belgian Congo, 764
Flora (Bacterial), of Roots : Influence of Light on (J. W. Rouatt and Dr. H. Katznelson), 659
Flora (A Mesozoic Micro-), from South Africa (A. R. H. Martin), 95
Flora (Suffolk) : Changes in the, during the Past 100 Years (F. W. Simpson), 771
Floras (Miocene), of the Columbia Plateau, Part I, Composition and Interpretation (Ralph W. Chaney) ; Part 2, Systematic Considerations (Ralph W. Chaney and Daniel I. Axelrod), *review* by Prof. J. Walton, 66
Flore du Congo Belge et du Ruanda-Urundi (Institut National pour l'Étude Agronomique du Congo Belge), Vol 9, 764
Florkin, M., et autres : Traité de Biochimie Generale, Vol. I, Composition Chimique des Organismes, *review* by Prof. F. G. Young, 51
Flour (Wheaten) : A Role for Thiol and Disulphide Groups in Determining the Rheological Properties of Dough made from (R. Frater, Dr. F J. R. Hird, H. J. Moss and J. R. Yates), 451
Flour Millers (British), Research Association of—New Laboratories (Dr. T. Moran), 856
Flow (Compressible) : Introduction to the Theory of (Prof Shih-I Pai), *review* by Dr. G. K. Batchelor, 1000
Flow (Pulsatile), through Tapered Distensible Vessels, Reflexions, and the Hosie Phenomenon (Robert L. Evans), 290
Flow (Thermally Stratified) : Wind Profile in (W. C. Swinbank), 463
Flow (Unsteady Supersonic) : The Potential Theory of (Prof. John W. Miles), *review* by L. E. Fraenkel, 505
Flow of Blood through Narrow Tubes (Dr. G W. Scott Blair), 708
Flow of Blood (Intrahepatic Shunted), in Cirrhosis of the Liver : Measurement of the (T. Nakamura, S Nakamura and K. Tokita), 243
Flowers : Selective Visits of Butterflies to—a Possible Factor in Sympatric Speciation (K R. Dronamraju), 178
Flowers (West African) : A Handbook of (Harold N. Saunders), *review* by J. P. M Brenan, 65
Floyd, Dr. W. F. Appointed first head of the Department of Ergonomics and Cybernetics at Loughborough College of Technology, 523
Fluctuations (Geomagnetic) : Influence of Geological Features on Very Low Frequency (H. J. Duffus, J. A. Shand and Sir Charles Wright), 141
Fluid (Amniotic) · Ultra-Structure of Human Amnion and its Possible Relation to the Circulation of (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Fluid (Pleural) : Mucopolysaccharides of Serum and (Prof. C. W. Fishel), 804
Fluid Dynamics (Dr. D. E Rutherford), *review* by Dr. G. K. Batchelor, 1000
Fluid Dynamics—a Mixed Bag, *review* by Dr. G. K. Batchelor, 1000
Fluid Masses : Rotating, *review* by D. G. King-Hele, 747
Fluid Mechanics (L. D. Landau and E. M. Lifshitz), translated from the Russian by J. B. Sykes and W. H. Reid, *review* by Dr. G. K. Batchelor, 1000
Fluids : Boundary-Layer Research in (Dr. G. E Gadd), 1022
Fluids (Human Cerebrospinal) : 5-Hydroxyindoles in (G. W. Ashcroft and D. F. Sharman), 1050
Fluoborate (*p*-*n*-Decyloxybenzenediazonium) : Reaction of, with Sodium Iodide in Benzene (Prof. W. Bradley and J. D. Thompson), 631
Fluorescence of Proteins labelled with various Fluorescent Dyes : Depolarization of the (C. S. Chadwick, Dr. P. Johnson and E. G. Richards), 239
Fluorescence (X-Ray) : Trace Analysis by, using Ion Exchange Resins (J. N. van Niekerk and J F. de Wet), 380
Fluorescent Dyes : Depolarization of the Fluorescence of Proteins labelled with various (C. S. Chadwick, Dr. P. Johnson and E. G. Richards), 239
Fluoridation of Drinking Water (Gerald H. Leatherman and J A. Ellis), 438
Fluorochrome (Nucleic Acid) : Inactivation by Visible Light of Yeast sensitized by a (David Freifelder and Prof. Robert B Uretz), 731
Fly (Adult House-), *Musca domestica* . Mechanisms of Resistance of the, to 'Cyclodiene' Insecticides (Dr. G. T. Brooks), 96
Focus Extreme Ultra-violet and Soft X-Rays : A Self-supporting Metal Fresnel Zone-plate to (Dr. Albert V. Baez), 958
Foetal Haemoglobin in the Monkey (N. N. Sen, K. C. Das and B. K. Aikat), 977
Fogg, Dr. G. E. : Appointed to the University of London chair of botany in Westfield College, 440
Foliar Abnormalities, including Repeated Branching and Root Formation, induced by Kinetin in Attached Leaves of *Marsilea* (Dr. A. Allsopp and Alicja Szweykowska), 813
Folkierski, Dr. A , and others : Growth of Surface Instabilities in a Linear Pinched Discharge, 624
Follett, Dr. D. H. : Appointed director of the Science Museum, London, 206, 518 ; work of, 518
Fondamentales (Bases), et Applications de la Thermodynamique Chimique (Prof. Maurice Dodé), Tome I, Les Principes, les Systèmes ideaux Gazeux, et avec Phases Condensées pures, *review* by Prof. A. R. Ubbelohde, 55
Food (Honeybee Larval) : Electrophoretic Components of the Proteins in (N. G. Patel, M. H. Haydak and T. A. Gochnauer), 633
Food Habits of Migratory Ducks (Harry G. Anderson), 17
Food Losses in Field and Store (Nutrition Society Symposium on), 685
Food Research Advisory Committee, 519
Food Storage, Advisory Committee on Poisonous Substances in Agriculture and : Appointment of Sir Charles Dodds as chairman, 934
Food and Agriculture Organization (United Nations) : André Mayer Fellowships for 1960, 15
  Animal Health Yearbook 1959, 281
Food-borne Infections and Intoxications : Report of a European Technical Conference on (World Health Organization of the United Nations), 852
Foot of the 'Abominable Snowman' : A Reconstruction of the (W. Tschernezky), 496
Foot-and-Mouth Disease : Influence of Route of Inoculation and Strain of Mouse on Infectivity Titrations of the Virus of (Wendy Heatley, H. H. Skinner and H. Subak-Sharpe), 909
Foraminifera in a Sediment Core from the Mindanao Trough : A Note on the (R. A. Reyment), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 6), 609
Ford, Boris Appointed director of the Institute of Education and professor of education in the Institute, University of Sheffield, 121 ; work of, 121
Ford, Dr. R. E. : Determination of Dieldrin Deposits on Sprayed Mud Surfaces, 994
Ford Foundation : Grant of 550,000 dollars to the Zoological Society of London, to endow research fellowships in Animal Reproduction, 519
Ford Research Fellowships in Animal Reproduction (Zoological Society of London), 519
Foregut of *Schistocerca gregaria* Forsk. : Nervous Control of Movements in the (Dr. K U. Clarke and H. Grenville), 98
Forerunner of Twentieth Century Physics—a Re-view of Larmor's 'Aether and Matter' (Lancelot Law Whyte), 1010
Forest Products Research Laboratory : Appointment of A C. Copisarow as director, 934
Forestry (Agriculture and) · East African (Dr. E. C. Humphries), 133
Forestry Commission : Leaflet No. 1, The Large Pine Weevil (*Hylobius abietis*), revised edition, 521
  Leaflet No. 45, The Roe Deer, 936
Form of Sponges . Influence of Environment on the Distribution and (Prof. M. A Ali), 177
Form Discrimination · Regularities in the Retina and Optic Lobes of *Octopus* in relation to (The Visual System of *Octopus*), (Prof. J. Z. Young), 836
Formation of Beryllium Carbide during the Corrosion of Beryllium in Carbon Monoxide and in Carbon Dioxide Gas (V. D. Scott), 466
Formation (Blood), in Rats : Effect of Manganese Edetate on (T. J. Sullivan), 87
Formation (Cell Wall), in Spores of the Fungus *Allomyces* (J M. Aronson and Prof. R. D Preston), 95
Formation (Multiple Spot), by Pure Substances . Paper Chromatography—(Dr. A. H. Beckett, M A. Beaven and Dr Ann E. Robinson), 775
Formation (Polymer), in Irradiated *p*-Xylene (Francis van Hecke), 382
Formation (Yolk), in Oocytes of *Patella coerulea* L. and *Aplysia depilans* L. as observed in the Electron Microscope (A Bolognani), 490
Formation and Reactivity of Self-trapped Electrons ('Polarons') : Primary Processes in the Action of Ionizing Radiations on Water— (Prof. Joseph Weiss), 751

Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-Violet Light : Use of Nitrous Oxide to discriminate between various (Prof. F. S. Dainton and S. A. Sills), 879
Forms of Hydrogen Atoms (H· and H_2^+ ?) produced by γ-Irradiation of Aqueous Solutions : Use of Nitrous Oxide to discriminate between the (Prof. F. S Dainton and Dr D. B. Peterson), 878
Forsek, Dr. Zlatko, and others . An Indicator Plaque-forming System for Demonstration of Interference by Non-cytocidal Strains of Rabies Virus, 821
Forshee, B. W. (Wilson, W. K., and) · Preservation of Documents (United States National Bureau of Standards, Monograph No. 5), 124
40th Anniversary of the October Revolution Soviet Reviews of Nuclear Science on the, *review* by Dr. T. E Allibone, 917
Foskett, D. J. (Vickery, B. C., and) : Classification and Indexing in Science, second edition, *review* by R Brightman, 190
Fossil Plants of the Carboniferous Rocks of Great Britain (Dr. Robert Crookall), second edition, *review* by T. M. Harris, 66
Fossil (Living and) Unicellular Algae and Aplanospores (D. M. Churchill), 493
Fossils British Caenozoic (Tertiary and Quaternary), (British Museum (Natural History)), *review*, 669
  Cleaning of, by Ultrasonic Waves (J. N. M. Firth), 684
Fossils (Micro-) (Lower Tertiary), from McMurdo Sound, Antarctica (Dr. Lucy M. M. Cranwell (Mrs Watson Smith), Dr H J Harrington and I. G. Speden), 700
Fottrell, P. F. : Elected to a Beit Memorial Junior Fellowship for Medical Research, 520
Fourah Bay College (University College of Sierra Leone) : Appointment of Dr. Davidson Nicol as principal, 599
Fowden, Dr. L. : Degradation of γ-Methylene-glutamic Acid by Plants, 897
Fowell, R. R. · Biology Staining Schedules, sixth edition, 125
Fowler, Dr. J. F. (Matthews, Dr. C. M E., and) A Comparison of Iodine-124 and Iodine-131 Thyroid Dosimetry, 983
Fowler, Dr. J. F. (Moses, Dr. V., and) : Helium–Butane Gas Mixtures as Fillings for Geiger-Müller Tubes, 538
Fox, H. C., and Miller, D. S. : Ackee Toxin, a Riboflavin Antimetabolite ?, 561
Fox, J. A. : Appointed lecturer in civil engineering at the University of Leeds, 767
Fractionation of Alcholic Plant Extracts : An Ion-Exchange Resin Method for the (Dr. Dalton Wang), 326
Fractionation of Genes (Prof. R. Ruggles Gates), 739
Fractionation of Heparin on an Anion Exchanger (Dr. J P. Green), 472
Fractionation of Two Metabolically Distinct Classes of Ribonucleic Acids in Animal Cells and its Bearings on Cancer (Prof A. Sibatani, K. Yamana, K. Kimura and T. Takahashi), 215
Fractions of Phenol-killed Tubercle Bacilli · Enhanced Resistance of Mice to Infection with *Pasteurella pestis* following Vaccination with (Prof. David W. Weiss), 1060
Fractions (Gas Chromatographic) · Microquantitative Infra-Red Analysis—Application to (J. E. Stewart, R. O. Brace, T Johns and W. F. Ulrich), 628
Fraenkel, L. E. : Unsteady Supersonic Flow, *review*, 505
Francium : The Radiochemistry of (Earl K. Hyde), 602
Francois, J., and others (edited by) : Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
Franklin, Mary T., and Hopper, D. J. : Plants Recorded as Resistant to Root-Knot Nematodes (*Meloidogyne* spp.), 684
Frater, R , and others : A Role for Thiol and Disulphide Groups in Determining the Rheological Properties of Dough made from Wheaten Flour, 451
Frazer, Prof. A. C : Medical Research in the British Caribbean, 862
Fredriksson, H. : A Sediment Core from the Mindanao Trough (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No 4), 609
Free Family : The (Paul and Jean Ritter), *review* by Prof M. D. Vernon, 38
Free Radical (Benzyloxyl), in Solution : Disproportionation and Dimerization of the (Dr. J. B. de Sousa and S. K. Ho), 776
Free-Radical Reactions · A Model to account for the Production of Vibrationally Hot Molecules in (Dr. J. P. Simons), 551
Free Radicals from Solids': The Tesla-coil Method for producing (Dr. C. H. Bamford, A D. Jenkins and J. C. Ward), 712
Freedman, Daniel X., and others : Serotonin Content of the Pineal Glands of Man and Monkey, 480
Freeman, Prof. John A. : Sex Difference in Accidental Mortality of Guppies exposed to Elevated Temperature, 491
Freeman, W. A., and others : Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methylisothiazole), a New Antibacterial Sulphonamide, 221
Freezing-Point Depressions of Hoagland's 'Carbowax' Systems (Howard G. Applegate), 232
Freifelder, David, and Uretz, Prof. Robert B : Inactivation by Visible Light of Yeast sensitized by a Nucleic Acid Fluorochrome, 731
French National School of Geographical Sciences · Theoretical and Technical Course on Aerial Photogrammetry, 127
Frequencies of the Haptoglobin Serum Groups among Blood Donors from Austria and Germany (Dr H. Baitsch, G. Meier, L. Schoeller and D. M Kahlich-Koenner), 976
Frequencies (Metal-ligand Stretching), of some Metal Hydrazine Complexes: The 'Irving–Williams' Order in the (Prof, L Sacconi and A. Sabatini), 549
Frequency (High), of Spontaneous and Induced Somatic Segregation in *Aspergillus nidulans* (Dr. Etta Käfer), 619
Frequency (Very Low) Geomagnetic Fluctuations : Influence of Geological Featutes on (H. J. Duffus, J. A. Shand and Sir Charles Wright), 141
Fresh and Aged Liver Mitochondria : Swelling of, as affected by Succinate, Adenine Nucleotides and Thyroxine (Dr. P. Emmelot, C. J. Bos, P. J. Brombacher and I. H. M. Reyers), 556
Freshwater Invertebrate Animals : A Guide to (Dr T. T. Macan), *review* by Dr. J. P Harding, 345
Freshwater Invertebrates, *review* by Dr. J. P. Harding, 345
Freshwater Snail : Chromosomes of *Gyraulus circumstratus*, a (John B. Burch), 497
Fresnel Zone-plate to Focus Extreme Ultra-violet and Soft X-Rays : A Self-supporting Metal (Dr. Albert V. Baez), 958
Friction Constant : The Liquid (Dr. G. H. A. Cole), 301
Friedman, Dr. Herbert : Elected a member of the United States National Academy of Sciences, 773
Fripiat, Dr. J. J., and Toussaint, F. : Predehydroxylation State of Kaolinite, 627
Fritz-Niggli, Prof. Dr. Hedi : Strahlenbiologie—Grundlagen und Ergebnisse, *review*, 66
Frog : Effect of Curare on Conduction in Myelinated, Isolated Nerve Fibres of the (Dr. Wolf D. Dettbarn), 891
Frog (California Yellow-legged) A Blood Parasite from the (Donald L. Lehmann), 765
Frohwein, Y. Z., and Leibowitz, Prof. J. Synthesis of 6-O-Acetyl-α-Glucose, 153
Froome, Dr K. D. · Millimetre Waves from Mercury Arc Harmonic Generator, 959
Fruit (*Nipa*) : A New Specimen of, from Mohgaonkalan Cherts (Dr S. D. Chitaley), 495
Fruits (Adhering and Abscising), of Peach treated with N-1-Naphthyl Phthalamic Acid : A Comparison of (Prof. Loyd E. Powell and Charlotte Pratt), 814
Fruits (Tomato and Apple) . Ethylene Production by (D. F. Meigh, K H. Norris, C. C Craft and M. Lieberman), 902
α-L-Fucosidase : Mammalian (Dr. G. A Levvy), 472
Fuel, Institute of : Annual Report for 1959, 601
  Fuel Abstracts and Current Titles, 601
Fuel Abstracts and Current Titles (Institute of Fuel), 601
Fuel Cells—Will they soon Become a Major Source of Electrical Energy? (F. T. Bacon), 589
Fuel Element Technology : Reactor (Imperial College of Science and Technology Course of Lectures in), 1025
Fujino, Prof. Masahiro, and others : Effect of Electrical Stimulation on a Muscle Fibre Model in the Presence of Adenosine Triphosphate, 318
Fuller, M. D. : Anisotropy of Susceptibility and the Natural Remanent Magnetization of some Welsh Slates, 791
Fulton, R. W., and others (edited by) . Plant Pathology, Problems and Progress, 1908-1958, *review* by W. C Moore, 47
Function of Genetic Elements : Structure and—Report of Symposium held June 1959 (Brookhaven Symposia in Biology, No. 12), *review* by Prof S. C. Harland, 63
Function of a Salivary Mucoprotein · Correlation between Composition, Structure, Shape and (Dr. Alfred Gottschalk), 949
Function of the Two Cytochrome Components in Chloroplasts—a Working Hypothesis (Dr. R. Hill and Dr. Fay Bendall), 136
Function of Universities, 107
Function (Structure and) : Protein (Brookhaven National Laboratory Symposia in Biology, No 13), 361
Functions (Gaussian Wave), for the Hydrogen Molecule (J V. L. Longstaff and Dr. K. Singer), 799
Functions (Mathematical) : Tables of Physical and Chemical Constants and some (Dr. G. W. C. Kaye and Dr. T. M Laby), twelfth edition, *review* by T. M. Yarwood, 67
Fundamental (A Possible), in the Behaviour of Young Nidifugous Birds (Dr. Peter M. Driver), 416
Fundamental Aspects of Reactor Shielding (Dr. Herbert Goldstein), *review* by Dr. T. E Allibone, 917
Fundamental and Applied Research : The Balance of, 341
Fundamentals of Nuclear Energy and Power Reactors (Henry Jacobowitz), *review* by Dr. T. E. Allibone, 917
Fungal Root-Infections of *Pinus* : Effects of *Gibberella fujikuroi* on (Dr. Ida Levisohn), 987
Fungi : Decomposition of Humic Acid by (Prof. Alan Burges and Pamela Latter), 404
Fungicides (Handbook of Toxicology, Vol. 5), analysis and compilation by Everett F. Davis, Barbara L. Tuma and Lucy C. Lee (edited by Dorothy S. Dittmer), *review*, 64
Fungus *Allomyces* : Cell Wall Formation in Spores of the (J. M. Aronson and Prof R. D Preston), 95
Funk, Dr. J. A : Awarded second prize (Home Awards) of the Darton Prizes of the Royal Meteorological Society, 440
Further Education, Northern Advisory Council on . Training of Technical Teachers, 281
  Report for 1958-59, 281
Further Education, Southern Regional Council for : Twelfth Annual Report, 123
Furunculosis in Salmon Kelts (Dr. Isabel W. Smith), 733
Fusarium Species : Characterization of a New Purine Riboside isolated from (Dr. Alessandro Ballini, Dr. Carlo Delfini and Dr. Serena Russi), 968
Fusarium moniliforme Sheld. (*Gibberella fujikuroi* (Saw.) Wr.) producing Substances with Gibberellin-like Biological Properties : Distribution and Prevalence of (Prof. W L. Gordon), 698
Fusarium oxysporum Schl forma *pisi* (Lindf.) S. and H.? : Is *Nectria haematococca* Berk and Br. the Perfect Stage of (Prof. W. L. Gordon), 903
Fusion (High-Temperature), of Possible Parent· Materials for Tektites (Origin of Tektites), (J. F. Lovering), 1028
Fusion Electrolysis of Titanium (Dr. W. J. Kroll), 685

Gates, Prof R Ruggles : Fractionation of Genes, 739
Gaussian Wave Functions for the Hydrogen Molecule (J. V. L. Longstaff and Dr K. Singer), 799
Gee, Prof G. Industrial Chemistry of the Lower Olefines, 286
  Polymeric Progress, 441
Geiger Counters (Self-Quenching), containing Mixtures of Permanent Gases (Dr Oswald Riedel), 876 ; (A. J. L. Collinson, I. C. Demetsopoullos, J A. Dennis and J. M. Zarzycki), 876
Geiger-Muller Tubes : Helium–Butane Gas Mixtures as Fillings for (Dr. V. Moses and Dr. J. F Fowler), 538
Geissman, T. A. : Principles of Organic Chemistry (now available in England), 17
Gel (Agar-) Electrophoresis : Variations in Electrophoretic Position of Haptoglobin Mixtures in (Dr Jan Hirschfeld), 894
Gel (Agar-) Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-Acetate Splitting Component in the α_1-Globulin Region of Normal Human Sera (Dr. Jan Hirschfeld), 321
Gel (Starch-) Electrophoresis : Separation of the α- and β-Chains of Globins by means of (C J. Muller), 643
Gel (Starch–Agar-) Electrophoresis of Tuberculoproteins from Heated Culture Filtrates (T. P Dekker), 392
Gelatin : Reversible Transformation of, to the Collagen Structure (Dr. Arthur Veis and Dr. Jerome Cohen), 720
Gell-Mann, Prof M. : Elected a member of the United States National Academy of Sciences, 773
Gellner, E. : Sociology—the New Hope, *review*, 504
Gels (Starch) : Broadening of the Water Proton Line in High-Resolution Nuclear Magnetic Resonance Spectra of (Dr. Roger Collison and Dr. M. P. McDonald), 548
Gene : Position of the, determining the Diploid-like Meiotic Behaviour of Wheat (Dr. Ralph Riley, Victor Chapman and Gordon Kimber), 259
General Biochemistry, *review* by Prof. F. G. Young, 51
General Certificate of Education Advanced Level Syllabuses in Science : Report of an Enquiry into the Suitability of the, as a Preparation for Direct Entry into First Degree Courses in the Faculty of Science (University of Birmingham), 687
General Electric Co., Ltd. : A Commercial Thermoelectric Cold Box, 439
General Electric Co., Ltd., and International Computers and Tabulators, Ltd. : A New British Transistorized Computer, 936
General Physiology, *review* by Prof. A St. G Huggett, 52, 284
  Principles of (W. M. Bayliss), fifth edition, by Dr. L E. Bayliss, *review* by Prof. A St. G. Huggett, 52, 284
  A Textbook of (Dr Hugh Davson), second edition, *review* by Prof. A. St. G. Huggett, 52
General Relativity : Gravitational Waves in (Dr. H. Bondi), 535
General System of Insect Migration and Dispersal by Flight : A Basis for a (C G. Johnson), 348
Generation (Spontaneous) : Thermodynamics and Kinetics of (Dr. D. E. Hull), 693 ; (Prof J. D Bernal), 694
Generator (Gas Discharge Harmonic) : Coherence and Band-width of a (N R Bierrum, D Walsh and J. C. Vokes), 626
Generator (Harmonic) : Millimetre Waves from Mercury Arc (Dr. K. D. Froome), 959
Genes : Fractionation of (Prof. R. Ruggles Gates), 739
Genes and Man . Radiation, (Prof. Bruce Wallace and Prof Th Dobzhansky), *review* by Dr A G. Searle, 109
Genetic Basis of Two Melanin Inhibitors in *Drosophila melanogaster* (Dr. R. A Kroman and Dr. P A Parsons), 411
Genetic Elements : Structure and Function of—Report of Symposium held June 1959 (Brookhaven Symposia in Biology, No. 12), *review* by Prof. S. C Harland, 63
Genetic Instability and Outcrossing in the Groundnut Variety Mani Pintar (J. Smartt), 1070
Genetic Interval (Short), in *Drosophila melanogaster* . Apparent Double Crossing-Over in a (Prof. M. M. Green), 990
Genetic Material : Exchange of—Mechanisms and Consequences (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 23), *review* by Prof. Kenneth Mather, 832
Genetic Radiation Hazards, *review* by Dr A G. Searle, 109
Genetic Recombination, *review* by Prof. Kenneth Mather, 832
Genetical Research, No. 1, 16
Genetical and Biochemical Studies of the Immobilization Antigens of *Paramecium aurelia* (J. O. Bishop and Dr. G. H Beale), 734
Genetics, National Institute of (Japan) : Annual Report No. 9 (1959), 286
Genetics of Resistance to Dieldrin in *Lucilia cuprina* Wied. (G. J. Shanahan), 181
Genetics (Human) : Outline of (Prof. L. S Penrose), *review* by Prof. H. Gruneberg, 347
Genetics (Medical) : An Introduction to (Dr. J A Fraser Roberts), second edition, *review* by R. H. Mole, 1003
Genetics (Population) : Electronic Computers in (W F. Bodmer), 851 ; (J L Crosby), 851
Genetyka (Edmund Malinowski), *review* by Dr. P. S. Hudson, 507
Genus New to the Old World . *Stereobalanus*, a (C. Burdon-Jones and A. D McIntyre), 491
Geographical Association : Course in Practical Field Techniques in Physical and Cultural Geography, 1020
Geographical Society (American) : Grant of 2,500 dollars from the Asia Foundation, to aid Asian libraries and Asian scholars temporarily in the United States, 126
Geographical Society (Royal) : Research Fellowship for work on the geography and topography of the Roman Fenland awarded to Dr. P. Salway, 684
Geographical Society (Royal Scottish) . Seventy-fifth Anniversary Exhibition (Mapping Britain), 523
Geographical Union, International : Tenth General Assembly and nineteenth International Congress, 938
Geography : Physical (Philip Lake), fourth edition, revised by Prof. J. A. Steers, *review* by Prof. L. Dudley Stamp, 190
Geography (Physical and Cultural) : Practical Field Techniques in (Geographical Association Course in), 1020
Geological Association (German): Jubilee Meeting (Discussion on Orogens), 206, 689
  Steinmann Medal awarded to Prof H. H. Read, 206, 690
Geological Congress : International, 938
Geological Features : Influence of, on Very Low Frequency Geomagnetic Fluctuations (H J. Duffus, J. A Shand and Sir Charles Wright), 141
Geological Nomenclature (English–Dutch–French–German), (edited by A. A. G Schieferdecker), *review* by Dr V. A. Eyles, 57
Geological Reconnaissance of the Sor-Rondane Mountains (Queen Maud Land), (Prof E E. Picciotto), 740
Geological Society : The Liverpool, 1859-1959 (R. G C. Bathurst), 9
Geological Society of London : Election of Officers, 603
Geological Survey of Canada Bulletin No. 54, Helicopter Operations of the Geological Survey of Canada, 521
Geological Survey of Great Britain : Memoirs of the, Palaeontology, Vol 4, Part 2, Fossil Plants of the Carboniferous Rocks of Great Britain (Dr Robert Crookall), second edition, *review* by T. M. Harris, 66
Geological Survey (United States) : Publication by the *American Journal of Science* of a 'Festschrift' in appreciation of the work of Dr. W. H. Bradley, chief geologist (1944-59), 934
Geological Surveying by Helicopter, 521
Geological Terms : Glossary of, *review* by Dr. V. A Eyles, 57
Geological Ways and By-Ways, *review* by Dr. J. V. Harrison, 57, 440
Geological and Mining Society of the Netherlands (Royal) : Geological Nomenclature (English–Dutch–French–German), (edited by A. A. G. Schieferdecker), *review* by Dr V. A. Eyles, 57
Géologie des Pétroles (Prof Maurice Robert), *review* by H. B. Milner, 268
Geologische Vereinigung (Deutsche) : Jubilee Meeting (Discussion on Orogens), 206, 689
  Steinmann Medal awarded to Prof H. H Read, 206, 690
Geologiska Undersokning (Sveriges) : Ser. C, No. 560, The Measurement of Rock Pressure in Mines (Nils Hast), 936
Geology : Principles of (James Gilluly, A. C. Waters and A. O. Woodford), second edition, *review* by Dr. J. V. Harrison, 57, 440
  Scottish, 1019
Geology in the U S.S.R : The Progress of (Prof. S. I. Tomkeieff), 438
Geology of Petroleum, *review* by H. B. Milner, 268
Geology (Glacial and Interglacial), in East Anglia . Investigating (Dr. R. G. West), 771

Geomagnetic Activities : Correlation of Occurrence of Whistlers with (Atsushi Kimpara), 230
Geomagnetic Field Lines : Motion of (C. J. Loughnan), 33
Geomagnetic Fluctuations : Influence of Geological Features on Very Low Frequency (H. J. Duffus, J A. Shand and Sir Charles Wright), 141
Geometry : Differential (Prof. Erwin Kreyszig), review, 70
Geometry of the Southern Auroral Zone and the Evidence for the Existence of an Inner Zone (Dr. T. Hatherton), 288
Geophysical Observatory : Mundaring, 606
Geophysical Research Directorate (United States) : Guenter Loeser Memorial Lecture (Dr. Hans E. Hinteregger), 523
Geophysical Year, International : Ionospheric Observations over Belgium during the (Royal Meteorological Institute of Belgium), 203
  U.S S.R and the, 359
Geophysical Year (International) Expedition : Results of the Royal Society's (Royal Society Discussion on), 191
George, Dr E. P. : Action Potentials in Active Tissue with Delayed Potassium Permeability, 889
Gergen, Dr. John L , and Huch, Dr. William F : A Synoptic Study of Infra-red Radiation over the United States, 426, *erratum*, 604
Germain-Jones, Dr. D. T : *Obituary*, 21
German Academy of Science and the Austrian Academy of Science : Preparation of an edition of the letters of Alexander von Humboldt (1769-1859), 685
German Geological Association : Jubilee Meeting (Discussion on Orogens), 206, 689
  Steinmann Medal awarded to Prof H. H. Read, 206, 690
Germany (Austria and) : Frequencies of the Haptoglobin Serum Groups among Blood Donors from (Dr. H. Baitsch, G. Meier, L. Scoeller and D. M. Kahlich-Koenner), 976
Gershon, Dr. Samuel : Blocking Effect of Tetrahydroaminacrin on a New Psychotomimetic Agent, 1072
Giant-Fibre Reflex of the Earthworm (Dr M. B. V. Roberts), 167
Giarman, Prof Nicholas J , and others : Serotonin Content of the Pineal Glands of Man and Monkey, 480
Giarman, Prof Nicholas J. (Pepeu, Giancarlo, and) : Effect of Methylpentynol on Acetylcholine in the Rat's Brain, 638
Gibberella fujikuroi : Effects of, on Fungal Root-Infections of *Pinus* (Dr. Ida Levisohn), 987
Gibberellic Acid and Osmotic Pressure (J. van den Ende and P. Koornneef), 327
Gibberellin-like Biological Properties : Distribution and Prevalence of *Fusarium moniliforme* Sheld. (*Gibberella fujikuroi* (Saw) Wr.) producing Substances with (Prof. W. L. Gordon), 698
Gibberellin-like Substances in Lettuce Seed : Presence of (Dr. S. Blumenthal-Goldschmidt and Prof A. Lang), 815
Gibberellin-treated Wheat Seedlings : Chlorophyll Content of (Prof. Frederick T. Wolf and Dr. Alan H Haber), 217
Gibbons, Dr J. L. (Coppen, Dr. A. J., and) : Saliva–Serum Ratios of Tritium after the Administration of Tritiated Water, 724
Gibson, Dr. R E. : Presented with the Capt. Robert Dexter Conrad Award, 122 ; work of, 122
Gifkins, R. C. : Visco-Elastic Systems (Deformations in Crystals), 942
Gifted Children : Psychology of (Dr. W. D. Wall), 692
Gilbert, Dr. G. A. : Concentration-Dependent Sedimentation of Aggregating Proteins in the Ultracentrifuge, 882
Gilbert, Dr. James B , and Ku, Dr. Yuoh : Urinary Excretion of a Ninhydrin-positive Compound, probably a Peptide, after Administration of β-Amino*iso*butyric Acid to the Mouse, 160
Gilbert, L. A. : Reflectance of Coal Vitrains in the Visible and Ultra-Violet compared with that of Graphite, 143
Giles, Prof. Norman H. : Appointed acting chairman of the Department of Botany in Yale University, 1020
Gillies, D. K. A. : Awarded second prize (Canadian Awards) of the Darton Prizes of the Royal Meteorological Society, 440
Gillies, Dr. N E., and others : The Sigmoid Survival Curve in Radiobiology, 1062
Gillman, Prof. Theodore, and others : Aortic, Serum, Connective Tissue and Osseous Chemistry in Lathyritic Rats, 164
Gilluly, James, and others : Principles of Geology, second edition, *review* by Dr. J. V. Harrison, 57, 440
Gilman, D. J., and others : Pentafluoropyridine, 231
Gilmour, Darcy : Activity in relation to *p*H of Myosin-5'-Nucleotidase, 295
Giraffe : The Respiratory Dead Space of the (Prof. Eugene D. Robin, Dr. Joseph M. Corson and Prof. Gustave J. Dammin), 24
Girault, Prof Maurice (Dugué, Prof. Daniel, et) : Analyse de Variance et Plans d'Expérience, *review* by Dr. D. J Finney, 68
Girling, Dr. J. : Gas Chromatography (Studies on the Identification of the Primary Products of the Pyrolysis of Coal), 944
Giuffrè, R., and others : Oxygen Equilibrium of Myoglobin from *Thunnus thynnus*, 896
Glacial and Interglacial Geology in East Anglia : Investigating (Dr. R. G. West), 771
Glaessner, Dr M. F : West-Pacific Stratigraphic Correlation, 1039
Glaessner, Dr. M. F , and Daily, B. : Late Precambrian Fauna in South Australia, 205
Glands (Pineal), of Man and Monkey : Serotonin Content of the (Prof Nicholas J. Giarman, Daniel X. Freedman and Luis Picard-Ami), 480
Glass : Initiation of Clotting in Normal and Hageman Plasma by (Dr Preben Ollendorff), 173
  Solar Furnace (Origin of Tektites), (Dr. Gerald S. Hawkins and Dr. Sumner H. Wolfson), 1027
  Time-lags in the Intrinsic Electrical Breakdown of (M N. Azam and H. Dickinson), 146
Glass : Physics and Chemistry of, Vol. 1, No. 1, (Society of Glass Technology), 601
Glass Making : Journals and the Science of, 601
Glass Technology : Vol. 1, No. 1 (Society of Glass Technology), 601
Glass Technology, Society of : *Glass Technology*, Vol. 1, No. 1, 601
  Physics and Chemistry of Glass, Vol 1, No. 1, 601
Globin, Haemoglobin and Haptoglobin : Observations on, using a Rabbit Antiglobin Serum (D. S Rowe and J. F. Soothill), 975
Globins : Separation of the α- and β-Chains of, by means of Starch-gel Electrophoresis (C J Muller), 643
Globular Clusters (Dr. T D. Kinman), 608
β-Globulin : A Haemoglobin-binding, in Human Serum (Dr. M. P. Tombs), 1055
α_2-Globulin Region of Normal Human Sera : Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the (Dr. Jan Hirschfeld), 321
β-Globulin Polymorphism in the Serum Proteins of Pigs : Thread Protein and (G C. Ashton), 991
β-Globulins in Serum and Milk from Cattle : Inheritance of (Bo Gahne, Jan Rendel and Dr Ole Venge), 907
Glossary of Geological Terms, *review* by Dr. V. A. Eyles, 57
Glossary (Russian-English), of Optics and Spectroscopy, *review* by Prof. S. I. Tomkeieff, 347
Glossary (Russian–English), of Solid State Physics (edited by I. Emin), *review* by Prof. S I Tomkeieff, 347
Glossina morsitans : Determination of Physiological Age for Female (D. S. Saunders), 651
Glucose in the Dog : Abrupt and Delayed Effects of Insulin on the Distribution Space of (Dr. G Hetenyi, jun , and Prof G A. Wrenshall), 808
Glucose on Paper Chromatograms : Specific Detection of (Dr. M R. J. Salton), 966
Glucose Tolerance Test : Improvement of the Intravenous (Dr John C. Seed, Dr. Forman S. Acton and Dr. Albert J. Stunkard), 808
Glucose (Blood) in Crayfishes in relation to Moult and Handling (Dr J. A. Riegel), 727
Glucose-6-Phosphate Dehydrogenase Deficiency in Red Blood Cells of East Africans (Dr A C. Allison), 531
Gluesenkamp, Earl, and others : Synthetic Polyelectrolytes as Tumour Inhibitors, 778
Glutamic Acid in Tobacco Leaves inoculated with Tobacco Mosaic Virus : Decarboxylation of (M S. Gubanski), 657
D-Glutamic Acid : Isolation of Mutants of *Bacillus subtilis* requiring (Haruo Momose and Prof. Yonosuke Ikeda), 567
D-Glutamic Acid-requiring Mutants of *Bacillus subtilis* : Physiology of (Haruo Momose and Prof. Yonosuke Ikeda), 818
Glutathione (edited by E M. Crook), (Biochemical Society, Symposium No. 17, 1958), *review*, 669
Glutathione (Importance of), for the Enzyme Status in Intact Cells : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the (Prof. S Rapoport and D. Scheuch), 967
Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells (Prof S Rapoport and D. Scheuch), 967
Glycogen in the Liver : Changes in the Levels of Adenosine Triphosphate and, caused by Protein Administration (Dr. Catherine M. Clark, Dr G A. J. Goodlad, Dr. J. Chisholm and Dr H. N. Munro), 719
Glycolipids (Type-Specific), of *Mycobacteria* : Mycosides, a New Class of (Donald W Smith, H. M. Randall, A. P. MacLennan and E. Lederer), 887
Goat Herd (Feral) : Home Range in a (Thane Riney and Graeme Caughley), 125
Goats : Influence of Cervical Sympathectomy and Pituitary Stalk Section upon Milk Secretion in (G. B. Tverskoy), 782
Gochnauer, T. A., and others : Electrophoretic Components of the Proteins in Honeybee Larval Food, 633
Goddard, Prof L. S. : Mathematics and the Conduction of Heat in Solids, *review*, 421
Godel's Proof (Ernest Nagel and James R. Newman), *review* by F. I. G. Rawlins, 61
Godwin, Dr. H : Appointed professor of botany in the University of Cambridge, 356 ; work of, 356
Goitre : International Conference on, 523
Goitrogenous and Non-goitrogenous Cabbage : Level of Sulphydryl Compounds in Rat Liver following Feeding with (Jozef Sedlák), 892
Gold Medals of the Institute of Mining and Metallurgy awarded to E. D. McDermott and J. Kruttschnitt, 854
Gold Medals of the Linnean Society of London presented to Dr. Libbie Henrietta Hyman and Dr. H Hamshaw Thomas, 766
Goldacre, Dr R. J., and Bean, A. D : A Model for Morphogenesis, 294
Goldhammer, Helen, and McManus, W. R. : Effects of Non-ionic Surfactants upon Animal Tissues, 317
Golding, R. M. : Ultra-Violet Spectra of Water Solutions, 308
Goldmann, H , and others (edited by) : Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
Goldstein, Dr. Herbert : Fundamental Aspects of Reactor Shielding, *review* by Dr. T. E. Allibone, 917
Golgi Bodies and Golgi Zones in Molluscan Oocytes (A. Bolognari), 565
Golgi Zones (Golgi Bodies and), in Molluscan Oocytes (A. Bolognari), 565
Gonadrotropin (Pregnant Mare Serum) : Effect of *p*H on Biological Activity of (Bengt H. Persson and Stig E J Melander), 163
Gonococcus Strains : Resistance of, to Penicillin (Alice Reyn and M. W. Bentzon), 608
Goodlad, Dr. G A. J., and others : Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by Protein Administration, 719
Goodman, M. : Polymeric Progress (Recent Work by the Polymer Group at Brooklyn Polytechnic), 442
Goodwin, Prof. A. J. H. : *Obituary* by Dr. S. H Haughton, 761
Gopalakrishnan, T. P. (Gangolly, S. R.), and co-workers : Recent Advances in Coconut Research in India, 861
Gorbman, Dr. Aubrey (Oztan, Dr. Nezihe, and) : Responsiveness of the Neurosecretory System of Larval Lampreys (*Petromyzon marinus*) to Light, 167
Gordon, Prof W. L. : Distribution and Prevalence of *Fusarium moniliforme* Sheld. (*Gibberella fujikuroi* (Saw) Wr.) producing Substances with Gibberellin-like Biological Properties, 698
  Is *Nectria haematococca* Berk and Br. the Perfect Stage of *Fusarium oxysporum* Schl forma *pisi* (Lindf.) S. and H.?, 903
Gordon Research Conferences 1960, 283
Gorer, Dr P A : Elected a Fellow of the Royal Society, 11
  Cancer Research in the U S.S.R., *review*, 420
Gorham, P R , and others : Evidence of Concurrent Translocation, 205
Gorrill, Dr. R H. : Text-Book of Bacteriology, *review*, 111

Gosling, H. W. : Awarded a grant of £3,000 from the Paul Instrument Fund, for the construction of an instrument for checking the stability of the standard ampere, 520
Gossling, B. S. : Heritable Changes in Lactic Streptococci induced by Physical Treatments, 868
Gottschalk, Dr. Alfred : Correlation between Composition, Structure, Shape and Function of a Salivary Mucoprotein, 949
Gottstein, J. W. : Visco-Elastic Systems (Influence of Changes in Moisture Content), 943
Gould, G. N. : Advances in Veterinary Surgery, *review*, 667
Governing Technical Colleges, 769
Government : The Technical Colleges and their (Joint Federation of British Industries Technical Colleges Committee), 769
Government of the Federation of Malaya, and others : International Conference on Natural Rubber Research, 767
Government Organizations and Statutory Bodies concerned with Scientific Research and Technical Services in the Federation of Rhodesia and Nyasaland, 202
Gracie, J. J. : Fellowship of the City and Guilds of London Institute conferred on, 13
Graddon, Dr. D. P. : Nature of Cupric Alkanoate Solutions, 715
Graduate Fellowships for 1960-61 (United States National Science Foundation Awards), 684
Graduates (American College) : Marriage-Rate of, 22
Graduates (College) Fertility of (Population Reference Bureau, Inc., *Population Bulletin*, Vol. 15, No. 6), 22
Graft : Non-Specific Tolerance of, and the Dissociation of Two Types of Immunity (Dr. Milan Hašek and Dr. Jan Hort), 985
Graft versus Host Reaction in Parabiotic Disease (Dr. B. Nakić, Z. Nakić and V. Silobrčić), 322
Grafting : Biological Problems of—a Symposium, sponsored by the Commission Administrative du Patrimoine Universitaire de Liège and the Council for International Organizations of Medical Sciences), *review* by Dr. D. M. V. Parrott, 51
Graham-Bryce, Dr. I. J., and Corkill, J. M. : Use of Solvents containing Ethyl Iodide in the Investigation of Phosphorescence Spectra of Organic Compounds, 965
Grainer, Jr., Prof. Thomas H. : A Guide to the History of Bacteriology, *review* by Dr. R. H. Gorrill, 111
Grainger, L. : Reactor Fuel Element Technology, 1025
Grandison, A. G. C. : Poisonous Amphibians and Reptiles, *review*, 269
Granit, Prof. Ragnar A. : Elected a Foreign Member of the Royal Society, 435
Granites : Age of Emplacement of (Dr. W. Compston, Dr. P. M. Jeffery and G. H. Riley), 702
Granitsas, Dr. A. N., and others : Thyroid-Powder Feeding and Liver Nitrogen in Mice, 890
Grant, Dr. L. S. (Sigel, Dr. M. M., and) : Medical Research in the British Caribbean (Intra-dermal Inoculation against Asian Influenza), 863
Grant, Dr. R. A., and others : Aortic, Serum, Connective Tissue and Osseous Chemistry in Lathyritic Rats, 164
Grants from the Cheesman and Pethybridge funds, to enable students of mycology to attend the Spring or Autumn Foray, or the Plant Pathology Field Meeting (Applications invited from members of the British Mycological Society, and heads of departments, for), 440
Grants for Medical Research (Wellcome Trust), 439
Grants for Research in Marine Biology or Oceanography (Challenger Society), 854
Grants (Postgraduate Training), in Fishery Research (Development Commissioners, the Ministry of Agriculture, Fisheries and Food, and the Scottish Home Department), 360
Granules (Mast Cell) : A Specific Stain for (Dr. B. G. Radden), 400
Granuloma (Carrageenin) : Biological Significance of Peptide containing Hydroxyproline during the Development of (Dr. M. Chvapil and B. Cmuchalová), 806
Graphite : High-Temperature Creep of (Dr. D. B. Fischbach), 795
  Reflectance of Coal Vitrains in the Visible and Ultra-Violet compared with that of (L. A. Gilbert), 143
  Structure of, and the Kinetics of its Reactions (Société de Chimie Physique Conference on), 284
Graphite as a Lubricant : Action of (W. Bollmann and J. Spreadborough), 29
Graphite (Pyrolytic) : Tensile Behaviour of, at 2,750°C. (H. E. Martens and W. V. Kotlensky), 960
Graphites : Gas Content of (Dr. J. P. Redmond and Dr. P. L. Walker, jun.), 72
  Mosaic Texture of (E. G. Steward and B. P. Cook), 797
Gravitational Waves in General Relativity (Dr. H. Bondi), 535
Gray, Asa, 1810-1888 (Prof. A. Hunter Dupree), *review* by Sir Edward Salisbury, 44
Gray, A. R. : Precipitating Antibody in Trypanosomiasis of Cattle and other Animals, 1058
Gray, Sir James : How Animals Move (Royal Institution Christmas Lectures, 1951), *review* by Dr. N. B. Marshall, 921
Graymore, C. N., and others : Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of Isolated Rat Liver Mitochondria, 392
Great Britain : Dairying in, *review* by Dr. C. C. Balch, 504
  Education and the Youth of, 577
  Fossil Plants of the Carboniferous Rocks of (Dr. Robert Crookall), second edition, *review* T. M. Harris, 66
  University Entrance in, 14

Human Cells in Tissue Culture : Effect of Oxygen and Nitric Oxide on the Radiosensitivity of (Dr. D. L. Dewey), 780
Human Cerebrospinal Fluid : Calcium and Magnesium in (Dr. G. Hunter and Honor V. Smith), 161
Human Cerebrospinal Fluids : 5-Hydroxyindoles in (G. W. Ashcroft and D. F. Sharman), 1050
Human Element in Research Management (Dr. B. E. Noltingk), *review* by E. S. Hiscocks, 579
Human Erythrocytes : Age Difference in Nicotinamide Mononucleotide Synthesis by (Dr. Vlastimil Habermann and Sona Habermannová), 389
Human Fertility : Problems of, *review* by Dr. Kenneth Walker, 188
Human Fertility Problem : Modern Science and the (Dr. Richard L. Meier), *review* by Dr. Kenneth Walker, 188
Human Genetics : Outline of (Prof. L. S. Penrose), *review* by Prof. H. Grüneberg, 347
Human Growth (Society for the Study of Human Biology Symposium on), 19
  Diagnosis of, *review* by Dr. K. M. Hawkins, 45
Human Haemoglobin Variants : A New Electrophoretic Medium and its Application to the Resolution of (Dr. E. R. Huehns and Dr. A. O. Jakubovic), 729
Human Heredity · Effects of Radiation on, 125
Human Knowledge : The Integration of (Prof. Oliver L. Reiser), *review* by Dr John Tucker, 37
Human Leucocytes · Culture of, on the Chorioallantoic Membrane of the Chick (Eugene Bell), 403
  Infra-Red Spectra of Deoxyribonucleic Acids from (G. Zerbi, P. A. Bianchi and E. E. Polli), 964
Human Problems of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G M. Stalker), (Department of Scientific and Industrial Research, Problems of Progress in Industry No. 5), 419
Human Problems of Innovation in Industry, 419
Human Repercussions : Automation and its, 364
Human Rites, *review* by Dr Kenneth Walker, 37
Human Sera (Normal) · Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of (Dr. Jan Hirschfeld), 321
Human Serum · A Haemoglobin-binding β-Globulin in (Dr. M. P. Tombs), 1055
Human Serum and Plasma · Antithromboplastin in (Dr. T. G. Scott, Dr. C. Symons and R L. Markham), 248
Human Spermatozoa Nuclear Morphology of (Dr Landrum B. Shettles), 648
Human White Cells and Platelets : Microelectrophoresis of (Dr. William P. Creger and Phyllis Menna Thomas), 171
Humboldt University, Berlin : 250th Anniversary of the Charité (Faculty of Medicine), 361
Humic Acid Decomposition of, by Fungi (Prof. Alan Burges and Pamela Latter), 404
Humidity (Relative) · Effect of, on Hatching and on Toxicity of Ovicides to Eggs of the Red Spider Mite, *Tetranychus telarius* (L.) (Acarina : Tetranychidae), (R. A. Harrison and A. G. Smith), 409
Humphreys, K. W., and Barry, H. D. : Cost of Scientific Periodical Publications, 124
Humphries, Dr. E C. : East African Agriculture and Forestry, 133
Hungarian Academy of Sciences : International Conference on Scientific Problems of Crop Protection, 523
Hunter, Donald : Health in Industry, *review* by T. H. Hawkins, 424
Hunter, Dr. G., and Smith, Honor V. : Calcium and Magnesium in Human Cerebrospinal Fluid, 161
Huntingford, G. W. B. : African Cultures, *review*, 38
Huntsman, Dr. R. G. (Anstall, Dr. H. B., and) · Influence of Temperature upon Blood Coagulation in a Cold- and a Warm-blooded Animal, 726
Hurst, Dr. E. Weston, and Reeve, P : Transmission of the Viruses of Trachoma, Inclusion Blennorrhoea and Lymphogranuloma to Mice, 336
Husbandry : Tropical Animal, *review* by Sir John Hammond, 49
Husbandry (Animal), in the Tropics : An Introduction to (G. Williamson and Dr. W. J. A Payne), *review* by Sir John Hammond, 49
Husbandry (Sheep), and Wool Technology at Pretoria, 280
Hushfar, F. (Donahue, T. M, and) : Detection of Negative Ions formed by Charge Transfer, 1038
Hussey, Dr. R. J., and others : Oxidation of Beryllium in Carbon Dioxide and in Carbon Monoxide, 468
Hutchinson, Dr. Franklin, and others : A Connexion between S–S Bond Breakage and Inactivation by Radiation of a Dry Enzyme, 312
Hutchinson, Prof. G. Evelyn : Elected a member of the Council of the United States National Academy of Sciences, 773
Hutchinson, Prof G. W. : Appointed to a newly established second chair of physics in the University of Southampton, 762 ; work of, 762
Hutson, Dr. D. H, and others . Action of a Bacterial Dextranase on Branched Dextrans, 553
Hutton, E. (Stevens, Dr. B., and) : Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in Energy Transfer Processes, 1045
Hutton, Prof. J. H. : *Obituary* of J. P. Mills, 1015
Hutton, Rosemary · Regular Micropulsations of the Earth's Field at the Equator, 955
Huxley, A. F. : Appointed to the University of London chair of physiology at University College, 1020
Huxley, Dr. H. E. : Elected a Fellow of the Royal Society, 11
Huygelen, Dr. C., and others · Isolation of a Cytopathogenic Agent from Skin Lesions of Cattle, 979
Hybrid Mice (Inbred and), reared at Two Different Temperatures : The Growth in Weight and Tail Length of (Prof. G. A. Harrison, R. J. Morton and Dr. J. S. Weiner), 446
Hybrids (Interspecific), of *Lycopersicum* (Dr. Donald Michie), 1071 ; (Helgi Nirk), 1071
Hyde, Earl K. : The Radiochemistry of Francium, 602
Hydrazine Complexes (Metal) : The 'Irving–Williams' Order in the Metal-ligand Stretching Frequencies of some (Prof. L. Sacconi and A. Sabatini), 549
Hydrobromide (S-β-aminoethylisothiouronium Bromide) : Effect of, on X-Ray Damage to Guinea Pig Skin (Dr. J. B. Walter and Prof. S. Slome), 177
Hydrocarbon Conversion : Hydrocarbon Synthesis and (Indian Institute of Science Symposium on), 691
Hydrocarbon Polymers : Mode of Radiation-Induced Cross-Linking in (T. F. Williams), 544
Hydrocarbon Synthesis and Hydrocarbon Conversion (Indian Institute of Science Symposium on), 691
Hydrocarbons in 'Painted' Mouse Skin : Effect of Molecular Structure upon Concentration of (Mary Burnham and Fred G. Bock), 323
Hydrocarbons (Aliphatic) : Radiation Labelling with Carbon-14 of (Fulvio Cacace and Angelo Guarino), 632
Hydrodynamics : Applied (H. R. Vallentine), *review* by E. P. Sutton, 669
Hydrogen Atoms : Mechanism of the Oxidation and Reduction of Metal Ions by (Prof. J. Halpern, G. Czapski, J. Jortner and Dr. G. Stein), 629
Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-violet Light : Use of Nitrous Oxide to discriminate between Various Forms of (Prof. F. S. Dainton and S. A. Sills), 879
Hydrogen Atoms ($H\cdot$ and H_2^+ ?) produced by γ-Irradiation of Aqueous Solutions · Use of Nitrous Oxide to discriminate between the Forms of (Prof. F. S. Dainton and Dr. D B. Peterson), 878
Hydrogen Ions : Mechanism of the Gastric Secretion of (Prof. Spyridon G. A. Alivisatos), 368
Hydrogen Molecule : Gaussian Wave Functions for the (J. Y. L. Longstaff and Dr. K. Singer), 799
Hydrogen Peroxide and Ionizing Rays : Combined Application of, in Animal Experiments (E. Fleischmann, H. Werkgartner and K. Karrer), 324
Hydrogen Peroxide–Water Solutions at 90°K. Irradiated with Ultra-Violet Light : Electron Spin Resonance in (Robert C. Smith and S. J. Wyatt), 226
Hydrology : Ground Water (Prof. David Keith Todd), *review* by E. Miller, 423
Hydrolysis by Chymotrypsin : Requirements for Stereospecificity in—Diethyl β-Acetamidoglutarate (Prof. Saul G. Cohen and Ezra Khedouri), 75
Hydroxide (Potassium) · Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or (J. Wawrzyniak and Dr. B. Sujak), 467
11β-Hydroxy Dehydrogenation (Microbiological), of Corticosterone (M. Shirasaka, R. Takasaki and M. Tsuruta), 390
4-Hydroxybenzaldehyde : Alkaline Conversion of 4-Hydroxyphenylpyruvic Acid to (Dr. C. H. Doy), 529
5-Hydroxyindoles : Vanadium Catalysis of the Oxidation of Catechol Amines, Dihydroxyphenylalanine and (Dr. G. M. Martin, E. P. Benditt and N. Eriksen), 884
5-Hydroxyindoles in Human Cerebrospinal Fluids (G. W. Ashcroft and D. F. Sharman), 1050
Hydroxyls (Alcoholic), of Oxycarboxylic Acids : Acidic Dissociation Constant of—Mandelic Acid (Dr. M. T. Beck and M. Halmos), 388
4-Hydroxyphenylpyruvic Acid : Alkaline Conversion of, to 4-Hydroxybenzaldehyde (Dr. C. H. Doy), 529
Hydroxyproline : Biological Significance of Peptide containing, during the Development of Carrageenin Granuloma (Dr. M. Chvapil and B. Cmuchalová), 806

Hydroxyproline from Steer Hide : Liberation of Hexuronic Acid, Hexosamine and, by Stem Bromelain (E A. Botan and T B Brother), 314
5-Hydroxytryptamine in Coelenterates (Prof. J H Welsh), 811
5-Hydroxytryptophan Decarboxylase Activity · Development of, in Rat Kidney (Dr. Irene Huang, Sheila Tannenbaum and Dr. David Yi-Yung Hsia), 717
Hylobius abietis : The Large Pine Weevil (Forestry Commission, Leaflet No. 1), revised edition, 521
Hyman, Dr Libbie Henrietta : Presented with a Gold Medal of the Linnean Society of London, 766
Hyman, Ray (Vogt, Evon Z., and) : Water-Witching U.S A., *review* by Prof. H. J Eysenck, 346
Hyperstatic Structures (Prof. J. A. L. Matheson), Vol 1, *review* by Prof. A. J. S. Pippard, 582
Hypothermia (Chlorpromazine) : Postural Changes in (Dr D. Svorad), 240

IDENTIFICATION of Isomeric Chondroitin Sulphates (J. B Adams), 555
Ignition . Explosions, Detonations, Flammability and, Part 1 (Prof. S S. Penner) ; Part 2 (B. P. Mullins), *review* by Dr. H. F. Coward, 666
Ikeda, Prof. Yônosuke (Momose, Haruo, and) : Isolation of Mutants of *Bacillus subtilis* requiring D-Glutamic Acid, 567
  Physiology of D-Glutamic Acid-requiring Mutants of *Bacillus subtilis*, 818
Illiac II (a copy of) to be installed in the Computation Centre of the University of Toronto, 682
Illinois Natural History Survey : Bulletin, Vol. 27, Article 4, Food Habits of Migratory Ducks (Harry G. Anderson), 17
Illuminating Engineering Society Summer Meeting, 206
Imagination · The Sociological (Prof. C Wright Mills), *review* by E. Gellner, 504
Immobilization Antigens of *Paramecium aurelia* · Genetical and Biochemical Studies of the (J. O. Bishop and Dr. G. H. Beale), 734
Immunity : Non-Specific Tolerance of Graft and the Dissociation of Two Types of (Dr Milan Hašek and Dr. Jan Hort), 985
Immunity in Haemorrhagic Septicaemia . Mechanism of (R V. S Bain), 734
Immunological Theory of Cancer : Binding of a Hepatocarcinogen to the Structural Lipoprotein of Rat Liver—its Bearing on the (H. W. Westrop and Prof. H. N. Green), 350
Immunological Tolerance A Possible Basis for (Dr. D T. Denhardt), 728
Immunologically Competent Cells in the Chick Embryo . Loss of Specificity on Passage of (Sir Macfarlane Burnet and Georgiana Boyer), 175
Immunology of Tumours . Pathogenesis and (edited by G. V. Vygodchikov), translated from the Russian by R. Crawford, *review* by Dr. P. A. Gorer, 420
Impacts of Scientific Research and Development : Projects in Colleges and Universities on the Economic and other (United States National Science Foundation), 14
Impedance (Total Acoustic Radiation), of Rigid Pistons in an Array Measurements of the (J. S. M Rusby), 144
Imperfections (Solid) : Superficial Chemistry and (Prof. F. C Tompkins), 3
Imperial Chemical Industries, Ltd. New Ammonia Plant at Severnside, 202
Imperial College of Science and Technology, London : Fifty-second Annual Report of the Governing Body (1958-59), 123
  Research Report of the Royal College of Science (1956-59), 123
  New Nematology Laboratory to be built and equipped at the Field Station at Silwood Park, 205
  Booklet on Postgraduate Courses (1960-61), 206
  Appointment of Dr. D. V. Ager to the University of London readership in geology, 522
  Election of Sir Harold Roxbee Cox, Prof. C W. Dannatt, Prof F. G. Gregory, G. C. Lowry and Sir William Pugh to Fellowships, 522
  Dinner to be held in honour of F Howarth, on his retirement from the Botany Department, 604
  Optical Design group to be set up under the direction of Dr. C. G. Wynne, with the support of a grant of £9,400 a year from the Department of Scientific and Industrial Research, 934
  Appointment of J. C de C. Henderson as reader in reinforced concrete structures, 938
  Course of Lectures in Reactor Fuel Element Technology, 1025
Implantation (Normal), in Ovariectomized Guinea Pigs (Dr. Ruth Deanesly), 327
Implications (Economic and Social), of Scientific Research and Development : A Bibliography on the (United States National Science Foundation), 14
Importance for the Demonstration of their Renal Origin Ultrastructure of the Clear Cells in Renal Carcinomas and its (Prof Ch. Oberling. M. Rivière and Fr. Haguenau), 402
Importance of Glutathione for the Enzyme Status in Intact Cells Glutathione Stability and Purophosphatase Activity in Reticulocytes—Direct Evidence for the (Prof S. Rapoport and D. Scheuch), 967
Importance in the Treatment of Tumours in Animals and Man : Actinomycins and their (New York Academy of Sciences Conference on), 771
Improvement of the Intravenous Glucose Tolerance Test (Dr. John C. Seed, Dr. Forman S. Acton and Dr. Albert J Stunkard), 808
nability of Methionine to affect Lethality in Mice and Rats exposed to X-Rays (Prof Zenon M. Bacq and Dr. Marie L Beaumariage), 1064
Inability of Thiotaurine to protect Mice against Ionizing Radiation (Dr. D. Cavallini and L. Tentori), 254
Inactivation of Cytochrome b_2 by Oxygen : Flavin Dissociation and (A New Type of Autoxidation Reaction), (J McD. Armstrong, Dr. J. H. Coates and Prof. R. K. Morton), 1033
Inactivation by Radiation of a Dry Enzyme · A Connexion between S–S Bond Breakage and (Dilip K. Ray, Dr. Franklin Hutchinson and H. J. Morowitz), 312
Inactivation of Trypsin by Ionizing Radiation · Effect of Oxygen on the (Prof. J. A. V. Butler and Dr. A. B. Robins), 697
Inactivation by Visible Light of Yeast sensitized by a Nucleic Acid Fluorochrome (David Freifelder and Prof Robert B. Uretz), 731
Inbred Lines of Chickens Differences in Numbers of Erythrocytes between (Dr. P. Jaffe), 978
Inbred and Hybrid Mice reared at Two Different Temperatures : The Growth in Weight and Tail Length of (Prof. G. A. Harrison, R. J. Morton and Dr J. S. Weiner), 446
Inception of Agriculture · Increase of Settlement Size and Population since the (Dr. Max Pettersson), 870
Inclusion Blennorrhoea and Lymphogranuloma (Trachoma,) : Transmission of the Viruses of, to Mice (Dr. E. Weston Hurst and P. Reeve), 336
Inclusions (Cytoplasmic), of the Ageing Neurons of some Teleosts (Prof. A. Stolk), 332
Increase in 'Alkaline' Ribonuclease of Rat Kidney Cortex after Lysozyme and Egg-White Administration (Dr. T. Maack, Dr. R. Brentani and Dr. M. Rabinovitch), 158
Increase in Environmental Temperature : Oxygen Consumption in Cattle in relation to Rate of (Prof. H. H. Kibler), 972
Increase of Settlement Size and Population since the Inception of Agriculture (Dr. Max Pettersson), 870
Increased Capillary Permeability in Injury by Monoamine Oxidase Inhibitors · Suppression of (W. G Spector and D. A Willoughby), 162
Increased Oxygen Consumption in Rats during Irradiation : Significance of Adrenals for (Dr. A. Vacek), 90
Incubation (Short *in vivo*), with Phosphate-^{32}P . Heterogeneous Labelling of Acid-soluble Nucleoside 5'-Monophosphates during (Dr. T. D. Price, K K. Tsuboi, H. A. Hinds and P. B. Hudson), 158
Indanthrene : Electron Microscopy and the Crystal Structure of (Lewis T. Chadderton), 541
Indeterminate Structures (Statically) : A Treatise on, *review* by Prof. A. J. S. Pippard, 582
Index of Crystallographic Supplies (edited by Dr. A. J. Rose), second edition (Société Française de Minéralogie et de Cristallographie), 1019
Indexing in Science : Classification and (B. C. Vickery and D. J. Foskett), second edition, *review* by R. Brightman, 190
India : Recent Advances in Coconut Research in (Indian Central Coconut Committee Conference on), 860
  The Wealth of, a Dictionary of Indian Raw Materials and Industrial Products—Raw Materials, Vol. 5, H–K, *review* by Dr. F. N. Howes, 70
Indian Central Coconut Committee : Conference on Recent Advances in Coconut Research in India, 860
Indian Council of Scientific and Industrial Research (Chemical Research Committee) · Symposium on Proteins, 767
Indian Institute of Science, Bangalore : Golden Jubilee Symposia (Prof. R. L Datta), 691
  Symposium on Hydrocarbon Synthesis and Hydrocarbon Conversion, 691
  Symposium on Mass Transfer, 691
Indian Mineralogist, No. 1 (Mineralogical Society of India), 683
Indian Substitutes of Male Fern in Pharmacognosy (Prof. P N. Mehra and T. C Mittal), 722
Indians of Northern Mato Grosso, Brazil : Evidence for a New Allele in the Kidd Blood Group System in (Dr. Richard T. Silver, Jane M. Haber and Dr. Aaron Kellner), 481
Indicator Plaque-forming System for Demonstration of Interference by Non-cytocidal Strains of Rabies Virus (Dr. Martin M. Kaplan, Dr. Eberhard Wecker, Dr. Zlatko Forsek and Dr. Hilary Koprowski), 821
Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera Agar-gel Electrophoretic Demonstration of (Dr. Jan Hirschfeld), 321
Indoles · Non-Enzymic Reactions of, with Coenzyme I (Prof. S G A. Alivisatos, G. A. Mourkides and A. Jibril), 718
Indonesian Council of Sciences (Unesco South-East Asia Science Co-operation Office and the) : Discussion on the Development of Science in South-East Asia, 859
Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera · Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an (Dr. Jan Hirschfeld), 321
Induced Somatic Segregation of *Aspergillus nidulans* : High Frequency of Spontaneous and (Dr. Etta Käfer), 619
Induced (Experimentally), Inter-bivalent Redistribution of Chiasmata in *Delphinium* (H. K. Jain and A. K. Bose), 260
Inducer (Specific) of the Male Sex Organ in certain Fern Species Purification of a (Ross B. Pringle, Ulrich Näf and Armin C. Braun), 1066
Induction of a Chorion-epitheliomatous Tumour in the Rat (R. Stein-Werblowsky), 980
Induction (Tumour), by *S E* Polyoma Virus : Development of Resistance in Mice to (Sarah E. Stewart, Bernice E. Eddy, Marjean Irwin and Stephanie Lee), 615
Induction and Reversion of *c*-Mutations by Irradiation of the Extracellular χ-Phage of *Serratia* (Prof. R. W. Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
Induction Phenomena in Photosynthesis of Isolated Spinach Chloroplasts (Dr. Knud Vejlby), 652
Industrial Chemistry of the Lower Olefines (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 285
Industrial Property, International Association for the Protection of : Twenty-fourth Congress, 440
Industrial Psychology, National Institute of : Vernon Prize for 1960 awarded to Dr. R B Buzzard, 938
Industrial Research in the United States, 763
Industrial Research (Scientific and) : The Balance of, 997
Industrial Research and Development Expenditure, 1958 (Department of Scientific and Industrial Research), 997
Industrial Training Council : First Report (1958-59), 15
  Training Services in Industry, 123
Industrialists : British—Steel and Hosiery, 1850-1950 (Charlotte Erickson), *review* by R Brightman, 347
Industries (British), and their Organization (Prof. G. C. Allen), fourth edition, *review* by R Brightman, 70
Industries (British), Federation of : Handbook on the Technical Colleges and their Government, 769
Industries (British) Technical Colleges Committee, Joint Federation of : The Technical Colleges and their Government, 769

Industry : Health in (Donald Hunter), *review* by T. H Hawkins, 424
  Human Problems of Innovation in, 419
  Mathematics, Education and—a Record of a Conference of Teachers, Research Scientists and Industrialists, held at the University of Liverpool (1959), 1017
  Problems of Progress in, No 5, Human Problems of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G M. Stalker), (Department of Scientific and Industrial Research), 419
  Training Services in (Industrial Training Council), 123
Industry (American) : Science and Engineering in—Report of a 1956 Survey (United States National Science Foundation), 763
Industry (Physical Sciences and) : Use of Radioisotopes in the (International Atomic Energy Agency Conference on), 284
Industry (Soviet) : Automatic Control in (Department of Scientific and Industrial Research), 287
Industry and Commerce : Appointments in, 682
Inert Gases : New Clathrate Compounds of the (J. G Waller), 429
Inexpensive Castle and Sample Holder for Radioactive Counting (Dr. Howard Boroughs), 145
Infant Mouse : Passage of Insulin through the Wall of the Gastro-intestinal Tract of the (W. A Kelly), 971
Infection with *Pasteurella pestis* : Enhanced Resistance of Mice to, following Vaccination with Fractions of Phenol-killed Tubercle Bacilli (Prof. David W Weiss), 1060
Infections (Food-borne), and Intoxications : Report of a European Technical Conference on (World Health Organization of the United Nations), 852
Infections (Fungal Root-), of *Pinus* : Effects of *Gibberella fujikuroi* on (Dr. Ida Levisohn), 987
Infections (Multiple), of Trematodes in a Snail (Wm H. Ewers), 990
Infections (Parasitic), in Early Medicine and Science : Parasites and (Prof. R. Hoeppli), *review* by Dr Ben Dawes, 46
Infective Diseases : The Aetiology of (Prof. Reginald Lovell), *review* by Dr G. Lapage, 581
  Factors and Causes of, *review* by Dr. G. Lapage, 581
Infective Larvae of *Oesophagostomum radiatum* (Rud 1803) (Strongylidae : Nematoda) : Effect of X-Rays on the Development of the (R F. Riek and R. K Keith), 981
Infectivity Titrations of the Virus of Foot-and-Mouth Disease : Influence of Route of Inoculation and Strain of Mouse on (Wendy Heatley, H. H Skinner and H. Subak-Sharpe), 909
Infestation Control Laboratory : Appointment of an Advisory Committee on the experimental and research work of the (Ministry of Agriculture, Fisheries and Food), 361
Inflammation (Experimental) : Elevation of Serum Haptoglobin in Rabbits in Response to (R. K Murray and G E. Connell), 86
Inflorescence of *Helichrysum arenarium* : Flavonoid Compounds in the (Z I. Jerzmanowska and J T. Grzybowska), 807
Influence : The Sun and its (Prof. M A. Ellison), second edition, *review* by Prof C. W. Allen, 69
Influence of Cervical Sympathectomy and Pituitary Stalk Section upon Milk Secretion in Goats (G. B Tverskoy), 782
Influence of Dietary Intake of certain Insecticides on the Haemoglobin and Erythrocyte Contents of Chick Blood (Prof B. K. Srivastava, H C. Saxena and J. C Sharma), 172
Influence of Environment on the Distribution and Form of Sponges (Prof. M A Ali), 177
Influence of Geological Features on Very Low Frequency Geomagnetic Fluctuations (H. J Duffus, J A Shand and Sir Charles Wright), 141
Influence of Light on Bacterial Flora of Roots (J W. Rouatt and Dr. H. Katznelson), 659
Influence on Measurement of Density : Adsorption of Helium on Carbons—(Dr. F. A P. Maggs, P. H. Schwabe and J. H. Williams), 956
Influence of Route of Inoculation and Strain of Mouse on Infectivity Titrations of the Virus of Foot-and-Mouth Disease (Wendy Heatley, H H. Skinner and H Subak-Sharpe), 909
Influence of Temperature upon Blood Coagulation in a Cold- and a Warm-blooded Animal (Dr H B. Anstall and Dr. R G Huntsman), 726
Information : The Measurement of, *review* by Prof. Colin Cherry, 506
Information (Scientific) : Abstracting, 358
Information Theory and Statistics (Prof. Solomon Kullback), *review* by Prof. Colin Cherry, 506
Infra-Red Analysis : Microquantitative—Application to Gas Chromatographic Fractions (J E. Stewart, R. O. Brace, T Johns and W F. Ulrich), 628
Infra-Red Radiation over the United States : A Synoptic Study of (Dr. John L. Gergen and Dr. William F. Huch), 426, *erratum*, 604
Infra-Red Spectra of Ammonia adsorbed on Silica–Alumina Catalysts (D. E. Nicholson), 630
Infra-Red Spectra of Deoxyribonucleic Acids from Human Leucocytes (G. Zerbi, P A Bianchi and E E. Polli), 964
Infra-Red Spectra of Deuterium-labelled Carbohydrates (Dr. S. A. Barker, R. H. Moore, Prof. M. Stacey and Dr. D. H. Whiffen), 307
Infra-Red Spectrum of Garnets (P Tarte), 234
Ingénieurs Électriciens, Association des (sortis de l'Institut Electrotechnique Montefiore) : International Information Day about Nuclear Energy, 440
Inglis, Prof. James : Dichotic Stimulation and Memory Disorder, 181
Inglis, J., and others : Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methyl*iso*thiazole), a New Bacterial Sulphonamide, 221
Ingold, Prof. C. T. : Nature and Exploitation of Crop Plant Resistance to Disease, 859
Inhaled Particles and Vapours (British Occupational Hygiene Society International Symposium on), 524
Inheritance of Asymmetry in a Water-boatman (*Krizousacorixa femorata*), (Dr. Walter Peters), 737
Inheritance of β-Globulins in Serum and Milk from Cattle (Bo Gahne, Jan Rendel and Dr. Ole Venge), 907
Inhibition of the Anaphylactic Release of Histamine from Chopped Guinea Pig Lung by Chymotrypsin Substrates and Inhibitors (Dr. K. F. Austen and Dr W E Brocklehurst), 866
Inhibition of Monoamine Oxidase by Benactyzine *in vitro* and *in vivo* (Dr. V Vítek and K. Ryšánek), 244
Inhibition' (Construct 'Reactive), in the Interpretation of Age Changes in Performance (Dr. S Griew and Dr. R. Lynn), 182
Inhibition (Specific), of Obligate Anaerobes (Dr. Herbert N. Prince), 816
Inhibitor of Aspartic Acid Utilization in *Leuconostoc mesenteroides* : (+) S-Methyl-L-Cysteine Sulphoxide, an (Wilfred N. Arnold, Clayton J Morris and John F. Thompson), 1051
Inhibitors (Chymotrypsin Substrates and) : Inhibition of the Anaphylactic Release of Histamine from Chopped Guinea Pig Lung by (Dr K F. Austen and Dr. W. E Brocklehurst), 866
Inhibitors (Melanin), in *Drosophila melanogaster* : Genetic Basis of Two (Dr. R A. Kroman and Dr P. A Parsons), 411
Inhibitors (Monoamine Oxidase) : Suppression of Increased Capillary Permeability in Injury by (W. G. Spector and D. A. Willoughby), 162
Inhibitors (Tumour) : Synthetic Polyelectrolytes as (Dr. William Regelson, Stephan Kuhar, Marvin Tunis, Joseph Fields, John Johnson and Earl Gluesenkamp), 778
Initiation of Clotting in Normal and Hageman Plasma by Glass (Dr. Preben Ollendorff), 173
Injection of Bovine Pineal Extract : Effects of, on the Nuclei of Rat Pineal Parenchymal Cells (Dr. Uno Holmgren, Dr Mark D Altschule and Dr. Richard J Wurtman), 393
Injured and Regenerating Muscles : Treatment of, with Plant Extracts (S. Hoja and J. Vittek), 283
Injury by Monoamine Oxidase Inhibitors : Suppression of Increased Capillary Permeability in (W. G Spector and D. A. Willoughby), 162
Inland Fishery Research Station, Sagana, Kenya (Dr. Vernon D. van Someren), 425
Inner Metagalaxy : The (Prof. Harlow Shapley), *review* by Dr D. W. Dewhirst, 109
Inner Zone : Geometry of the Southern Auroral Zone and the Evidence for the Existence of an (Dr. T. Hatherton), 288
Innovation : Human Problems of (Based on a Study of some Scottish Firms by Tom Burns and G. M. Stalker), (Department of Scientflic and Industrial Research, Problems of Progress in Industry, No 5), 419
Innovation in Industry : Human Problems of, 419
Inoculation (Route of), and Strain of Mouse : Influence of, on Infectivity Titrations of the Virus of Foot-and-Mouth Disease (Wendy Heatley, H. H. Skinner and H. Subak-Sharpe), 909
Inorganic Salts : Specific Interaction of Native Protein and (Folke Ronnike), 88
Insect Cuticle : Wetting Properties of (J W. L Beament), 408
Insect Migrants High in the Air : Mortality and Viability of (L. R. Taylor), 410
Insect Migration and Dispersal by Flight : A Basis for a General System of (C G Johnson), 348
Insect Photography, *review* by H. Oldroyd, 187
Insectes : Les Plus Beaux (Textes de A Villiers), *review* by H. Oldroyd 187
Insecticides : Influence of Dietary Intake of certain, on the Haemoglobin and Erythrocyte Contents of Chick Blood (Prof. B. K Srivastava, H C. Saxena and J C. Sharma), 172
Insecticides ('Cyclodiene') : Mechanisms of Resistance of the Adult House-fly (*Musca domestica*) to (Dr G. T Brooks), 96
Insects and Length of Day, 774
Insects (Agricultural), of East Africa (compiled by R. H. Le Pelley), *review* by Dr. Kenneth Mellanby, 65
Insemination (Artificial), in Cattle, *review* by Sir John Hammond, 667
Instabilities (Surface), in a Linear Pinched Discharge : Growth of (Dr R. Latham, J. A. Nation, F. L. Curzon and Dr. A. Folkierski), 624
Instability of Cytochrome c Reductase : Cause of the (A New Type of Autoxidation Reaction), (Dr Malcolm Dixon, J. M Maynard and P F. W. Morrow), 1032
Instability (Genetic), and Outcrossing in the Groundnut Variety Mani Pintar (J. Smartt), 1070
Instillation (Gastric), of 3-Monohydroxycholanic Acid : Cirrhosis of the Liver induced in Rabbits by (Dr. Paul Holsti), 250
Instinctive Behaviour, the Development of a Modern Concept (translated and edited by Claire H. Schiller), *review* by Dr R. A. Hinde, 43
Institut Électrotechnique Montefiore (Association des Ingénieurs Électriciens sortis de) : International Information Day about Nuclear Energy, 440
Institut National pour l'Étude Agronomique du Congo Belge : Flore du Congo Belge et du Ruanda-Urundi, Vol. 9, 764
Institutions concerned with Atomic Energy : World List of (International Atomic Energy Agency), 361
Instrument Abstracts (British Scientific Instrument Research Association), Vol. 15, No 1, 359, *erratum*, 685
Instruments (New), for Electronic Engineers, 852
Instruments (Electronics and) Exhibition and Convention : Annual (Institution of Electronics), 685
Insulin : Abrupt and Delayed Effects of, on the Distribution Space of Glucose in the Dog (Dr G Hetenyi, jun., and Prof. G. A. Wrenshall), 808
  Passage of, through the Wall of the Gastro-intestinal Tract of the Infant Mouse (W A. Kelly), 971
Insulin Dimers and Hexamers : Symmetry of (Prof. Barbara W. Low and J. Ralph Einstein), 470
Insulin (Œstrogen–) Interaction on the Uterus of the Rat (Dr. R. Michel Zilberstein), 635
Intact Cells : Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the Enzyme Status in (Prof S Rapoport and D. Scheuch), 967
Intake (Dietary), of certain Insecticides : Influence of, on the Haemoglobin and Erythrocyte Contents of Chick Blood (Prof B. K. Srivastava, H. C Saxena and J. C. Sharma), 172
Intake and Excretion of Water in the Rat : Effect of Severing the Olfactory Bulbs on the (V Nováková and H. Dlouhá), 638
Integration of Human Knowledge (Prof. Oliver L. Reiser), *review* by Dr. John Tucker, 37
Intelligent Machines : Symbolic Logic and (Edmund C. Berkeley), *review* by Dr A D. Booth, 422
Intensity (Cosmic Ray), in Interplanetary Space (Dr H. Elliot), 299
Intensity Distributions in the N_2 Lyman–Birge–Hopfield and CO Fourth Positive Band Systems : Interpretation of (Prof R. W. Nicholls, 958
Interaction between Albumin, Lecithin and Cephalin (Dr Eric Ponder and Ruth V. Ponder), 235
Interaction (Œstrogen–Insulin), on the Uterus of the Rat (Dr R. Michel Zilberstein), 635

Interaction (Specific), of Native Protein and Inorganic Salts (Folke Rønnike), 88
Inter-bivalent Redistribution of Chiasmata in *Delphinium* : Experimentally Induced (H. K Jain and A. K. Bose), 260
Interbreeding Sub-species : The Redpoll in New Zealand— (David Stenhouse), 488
Interference by Non-cytocidal Strains of Rabies Virus An Indicator Plaque-forming System for Demonstration of (Dr. Martin M. Kaplan, Dr Eberhard Wecker, Dr. Zlatko Forsek and Dr. Hilary Koprowski), 821
Interglacial Geology (Glacial and), in East Anglia : Investigating (Dr. R. G. West), 771
International Association for the Protection of Industrial Property : Twenty-fourth Congress, 440
International Astronautical Congress (Swedish Interplanetary Society), 523
International Astronomical Union Symposium No. 6, Electromagnetic Phenomena in Cosmical Physics (Stockholm 1956), (edited by B Lehnert), *review* by Dr. R. H. Garstang, 67
International Atomic Energy Agency : Appointment of Prof. C. Salvetti as director of the Division of Research and Laboratories, 17
  International Directory of Radioisotopes, Vol. I, Unprocessed and Processed Radioisotope Preparations and Special Radiation Sources , Vol. 2, Compounds of Carbon-14, Hydrogen-3, Iodine-131, Phosphorus-32 and Sulphur-35, 282
  Scientific Conference (Use of Radioisotopes in the Physical Sciences and Industry), 284
  General Publication No 3, World List of Institutions concerned with Atomic Energy, 361
  Appointment of Dr. Gerald B. Cook as chief chemist, 854
  Assistance Programme, 855
International Basimetric Society (Society for Biological Rhythm and the) : Seventh International Conference, 604
International Colloquium on Sub-aquatic Medicine (Club Alpin Sous-Marin), 440
International Committee on Photobiology : International Congress on Photobiology, 523
International Communications and Scientific Journals, 358
International Computation Centre (Provisional) : *Bulletin*, No. 8, 764
International Computers and Tabulators, Ltd. (General Electric Co., and) A New British Transistorized Computer, 936
International Conference on Congenital Malformations (International Medical Congress, Ltd.), 685
International Conference on Goitre, 523
International Conference on Medical Electronics, and associated Exhibition (Electronics and Communications Section of the Institution of Electrical Engineers and the International Federation for Medical Electronics), 523
International Conference on Nuclear Physics : Proceedings of the—Low-Energy Nuclear Interactions and Nuclear Structure, Paris 1958 (presented by P. Gugenberger), *review* by Dr E. Bretscher, 58
International Conference on the Peaceful Uses of Atomic Energy . Proceedings of the United Nations Second, held in Geneva, 1958, Vol. 2, Survey of Raw Material Resources, *review* by Prof. C. F. Davidson, 921
International Conference on Powder Metallurgy (Metal Powder Industries Federation), 361
International Conference on Science in the Advancement of New States (Weizmann Institute of Science), 604
International Conference on Scientific Problems of Crop Protection (Hungarian Academy of Sciences), 523
International Congress on the Aeronautical Sciences : Proceedings of the First—Advances in Aeronautical Sciences (edited by Th. von Kármán, A. M. Ballantyne, R. R. Dexter, H Blenk, H. L. Dryden and M. Roy), *review* by Prof. A R. Collar, 665
International Congress on Automatic Control . First, 439
International Congress on Biophysics, 1020
International Congress of Endocrinology, 523
International Congress of Entomology, 938
International Congress of the History of Science : Tenth, 767
International Congress on Photobiology (International Committee of Photobiology), 523
International Congress of Zoology, 604
International Control of Narcotic Drugs, 21
International Co-operation and the Production of Calcium-47, 1018
International Council of Scientific Unions : Work of the Abstracting Board (Prof. E. A. Boutry), 358
International Council of Scientific Unions (Committee on Space Research) : First International Space Science Symposium, 749
International Directory of Radioisotopes, Vol. I, Unprocessed and Processed Radioisotope Preparations and Special Radiation Sources ; Vol. 2, Compounds of Carbon-14, Hydrogen-3, Iodine-131, Phosphorus-32 and Sulphur-35 (International Atomic Energy Agency), 282
International Federation for Medical Electronics (Electronics and Communications Section of the Institution of Electrical Engineers and the) : International Conference on Medical Electronics, and associated Exhibition, 523
International Geographical Union : Tenth General Assembly and nineteenth International Congress, 938
International Geological Congress, 938
International Geophysical Year : Ionospheric Observations over Belgium during the (Royal Meteorological Institute of Belgium), 203
  U.S S.R. and the, 359
International Geophysical Year Expedition : Results of the Royal Society's (Royal Society Discussion on), 191
International Medical Congress, Ltd. : International Conference on Congenital Malformations, 685
International Organizations of Medical Sciences, Council for (Commission Administrative du Patrimoine Universitaire de Liège and the) : Symposium on Biological Problems of Grafting, *review* by Dr. D. M. V Parrott, 51
International School of Physics (Società Italiana di Fisica), 17
International Scientific Film Association : Fourteenth Congress, 767
International Space Science Symposium : First (Committee on Space Research of the International Council of Scientific Unions), 749
International Summer Course on Plasma Physics (Danish Atomic Energy Commission), 938
International Symposium on Combustion, 938
International Symposium on Inhaled Particles and Vapours (British Occupational Hygiene Society), 524
International Symposium on Nuclear Electronics : Proceedings of the (organized by the French Society of Radioelectricians), (Sessions 1-5), *review* by W. Abson, 583
International Union for Conservation of Nature and Natural Resources : Seventh General Assembly, jointly with the eighth Technical Meeting, 206
International Union of Crystallography : Fifth General Assembly, 1020
  Symposium on Thermal Motion in Crystals and Molecules, 1020
  Symposium on Lattice Defects and the Mechanical Properties of Solids, 1020
International Union of Crystallography (Commission on Crystallographic Apparatus) : Index of Crystallographic Supplies (edited by Dr. A. J. Rose), second edition, 1019
Interpersonal Behaviour : Person Perception and (edited by Renato Tagiuri and Luigi Petrullo), *review* by Prof. M. D Vernon, 919
Interplanetary Ionization : Solar Extreme Ultra-violet Radiation as a Source of (Dr. Hans E. Hinteregger), 523
Interplanetary Society (Swedish) : Eleventh International Astronautical Congress, 523
Interplanetary Space : Cosmic Ray Intensity in (Dr. H. Elliot), 299
Interpolation Scheme : An Energy Band, with Application to Body-centred Cubic Lithium (J F. Cornwell and Dr. E. P. Wohlfarth), 379
Interpretation of Age Changes in Performance : Construct 'Reactive Inhibition' in the (Dr S Griew and Dr R. Lynn), 182
Interpretation of Cosmology (Prof. W. H McCrea), 1035
Interpretation of Intensity Distributions in the N_2 Lyman–Birge–Hopfield and CO Fourth Positive Band Systems (Prof R W. Nicholls), 958
Interpretation (Distribution-Free), of Spray-Drop Data (John B. Opfell), 822
Interpretation (A New), of the Mullite Problem (J H Welch), 545
Interrelation of Tryptophan and Nicotinic Acid in Man during the First Month of Life (S. Auricchio, E. Quagliariello and A. Rubino), 639
Interspecific Hybrids of *Lycopersicum* (Dr. Donald Michie), 1071 ; (Helgi Nirk), 1071
Interstitial Cell Nucleus (Testicular), in the Adult Rat : Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the (S L. Liu), 475
Interstitial Cell-stimulating Hormone : Histophotometrical Study of the Effect of, on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat (S. L. Liu), 475
Intestine (Small) : Fate of Bacteria in the (J. M. S. Dixon), 521
Intoxications (Food-borne Infections and) : Report of a European Technical Conference on (World Health Organization of the United Nations), 852
Intracellular Potentials in Rat Atria during and after Vagal Stimulation or Acetylcholine Administration (P. A. Bierstaker, J. Th. F. Boeles and L. N. Bouman), 637
Intrahepatic Shunted Flow of Blood in Cirrhosis of the Liver : Measurement of the (T. Nakamura, S. Nakamura and K. Tokita), 243
Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin : Enhancement of Staphyloccal Virulence for Mice by (Dr. Daniel Amsterdam and Dr. S. Stanley Schneierson), 101
Intraspecific Differentiation—Biological and Social Aspects (Dr. Max Pettersson), 431
Intravenous Glucose Tolerance Test : Improvement of the (Dr. John C. Seed, Dr Forman S. Acton and Dr Albert J. Stunkard), 808
Intrinsic Electrical Breakdown of Glass : Time-lags in the (M. N. Azam and H Dickinson), 146
Intrinsic Recombination Radiation in Diamond (J C. Male and J. R Prior), 1037
Invention : National Reference Library of Science and, 934
Inventory of Economic Studies concerning Africa South of the Sahara—an Annotated Reading List of Books, Articles and Official Publications (edited by Peter Ady), (Commission for Technical Co-operation in Africa South of the Sahara, CSA/CCTA Publication No. 30, Joint Project No 4), 202
Invertebrate Animals (Freshwater) : A Guide to (Dr T. T. Macan), *review* by Dr. J. P. Harding, 345
Invertebrate Evolution : Exhibit of (Australian Museum), 438
Invertebrates : Freshwater, *review* by Dr. J. P. Harding, 345
  These are (Exhibit at the Australian Museum), 438
Investigating Glacial and Interglacial Geology in East Anglia (Dr. R. G. West), 771
Investigation of Phosphorescence Spectra of Organic Compounds : Use of Solvents containing Ethyl Iodide in the (Dr. I. J. Graham-Bryce and J M. Corkill), 965
Iodide (Ethyl) : Use of Solvents containing, in the Investigation of Phosphorescence Spectra of Organic Compounds (Dr. I. J. Graham-Bryce and J. M. Corkill), 965
Iodide (Potassium), irradiated with Ultra-violet Light : Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of (Prof. F. S. Dainton and S. A. Sills), 879
Iodide (Sodium), in Benzene : Reaction of *p*-*n*-Decyloxybenzenediazonium Fluoborate with (Prof. W. Bradley and J. D. Thompson), 631
Iodinated Protein in the Young Mouse : Selection of (W. A. Hemmings), 399
Iodination of Specific Sites on Bovine Serum Albumin (Dr. David Pressman and Dr. Gerald Radzimski), 1049
Iodine-124 and Iodine-131 Thyroid Dosimetry : A Comparison of (Dr. C. M. E. Matthews and Dr. J. F. Fowler), 983
Iodine-131 Thyroid Dosimetry : A Comparison of Iodine-124 and (Dr. C. M. E. Matthews and Dr. J. F. Fowler), 983
Iodine-131 (Sodium-24, Potassium-42 and) : Clearance Rates of, in Normal Dog Hip Joints (Prof. Patrick G. Laing and Dr. Ik Dong Kim), 898
7-Iodo-6-Deoxytetracycline (Radioactive), in Tumour Tissue (Dr Joseph J. Hlavka and Donald A Buyske), 1064
Ion-Exchange Resin Method for the Fractionation of Alcoholic Plant Extracts (Dr. Dalton Wang), 326
Ion Exchange Resins : Trace Analysis by X-Ray Fluorescence using (J. N. van Niekerk and J. F. de Wet), 380
Ionization of *n*-Paraffin Molecules (W. M. Fairbairn), 151
Ionization (Interplanetary) : Solar Extreme Ultra-violet Radiation as a Source of (Dr. Hans E. Hinteregger), 523

Ionizing Radiation : Chemical Effects of, on Deoxyribonucleic Acid in Dilute Aqueous Solution (G. Hems), 710
  Effect of Oxygen on the Inactivation of Trypsin by (Prof. J. A. V. Butler and Dr. A. B Robins), 697
  Inability of Thiotaurine to protect Mice against (Dr. D. Cavallini and L. Tentori), 254
  Significance of the 'Equivalent Redox Potential' in Aqueous Solutions under (Dr. G. H. Cartledge), 370
  Use of, in Spot Tests for Nitrogenous Compounds (H. J. M. Bowen, E. Arter and P. A. Cawse), 383
Ionizing Radiations on Water : Primary Processes in the Action of—Formation and Reactivity of Self-trapped Electrons ('Polarons'), (Prof. Joseph Weiss), 751
Ionizing Rays : Combined Application of Hydrogen Peroxide and, in Animal Experiments (E. Fleischmann, H. Werkgartner and K. Karrer), 324
Ionosphere · The Mesopause Region of the (Dr J. D. Whitehead), 461
Ionosphere (Magneto-) Disturbances (Academy of Sciences of the U.S.S.R), 359
Ionosphere (Upper) : Electron Density Measurements in the, using the Faraday Rotation of Radio Signals from Artificial Satellites (Dr. D. McL. A. Wilson), 623
Ionospheric Effects associated with the Solar Flare of July 10, 1959 (V. A. H. Harrison), 228
Ionospheric Observations over Belgium during the International Geophysical Year (Royal Meteorological Institute of Belgium), 203
Ionospheric Research (NATO Meeting on), 685
Ions (Hydrogen) : Mechanism of the Gastric Secretion of (Prof. Spyridon G. A. Alivisatos), 368
Ions (Metal) Mechanism of the Oxidation and Reduction of, by Hydrogen Atoms (Prof. J. Halpern, G. Czapski, J. Jortner and Dr. G. Stein), 629
Ions (Negative), formed by Charge Transfer : Detection of (T. M. Donahue and F Hushfar), 1038
Ions (Transition Metal) : Heats and Entropies of Reaction of, with Ethylenediamine (M. Ciampolini, P. Paoletti and Prof. L. Sacconi), 880
Ireland : Occurrence of the Slipper Limpet, *Crepidula fornicata* L., in (D. C. Arnold), 95
Iridium–Platinum Alloys : Constitution and Properties of the (Dr. A. S. Darling), 211
Iron : Crystal Growths and the Corrosion of (Earl A. Gulbransen and Thomas P Copan), 959
Iron Bacteria in Mine-waters (Dr L. G. M. Baas Becking and Dr. D. Moore), 670
Iron Meteorites : Exposure Ages for (Oliver A. Schaeffer and David E. Fisher), 1040
Iron Tricarbonyl (Tetraphenyl*cyclo*butadiene) : Crystal Structure of (R. P. Dodge and Dr. V. Schomaker), 798
Iron and Steel Institute : Bessemer Gold Medal for 1960 awarded to Prof. Hermann Schenck, 13
  Sir Robert Hadfield Medal for 1960 awarded to Dr. J. C. Hudson, 13
  Andrew Carnegie Silver Medal for 1959 awarded to Dr. P. R. V. Evans, 13
  William Prize for 1959 awarded to I. M. D. Halliday, 13
  Election of W. F. Cartwright as president for 1960-61, 13
Iron and Steel Research Association (British) . Grant of £1,000 to the University of Oxford for the continuation of research on the melting- and freezing-points of alloys, being carried out in the Department of Metallurgy, 126
  Conference on Heat Treatment Practice, 523
Irradiated with Ultra-Violet Light : Electron Spin Resonance in Hydrogen Peroxide–Water Solutions at 90°K. (Robert C. Smith and S. J. Wyatt), 226
Irradiated *p*-Xylene · Polymer Formation in (Francis van Hecke), 382
Irradiation : Significance of Adrenals for Increased Oxygen Consumption in Rats during (Dr. A. Vacek), 90
Irradiation Conference : Australian, 126
Irradiation of the Extracellular χ-Phage of *Serratia* · Induction and Reversion of c-Mutations by (Prof R. W. Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
γ-Irradiation of Aqueous Solutions : Use of Nitrous Oxide to discriminate between the Forms of Hydrogen Atoms ($H\cdot$ and H_2^+ ?) produced by (Prof. F. S. Dainton and Dr. D. B. Peterson), 878
Irradiation (Serial) : Changes in the Deoxyribonucleic Acid Content of Mouse Sarcoma 37 Cells following (Dr. A. E. G. Pearson and N. B. Atkin), 647
Irvine, Dr. R. A. : Medical Research in the British Caribbean (Clinical Occurrence of Encephalitis in Jamaica), 863
'Irving–Williams' Order in the Metal-ligand Stretching Frequencies of some Metal Hydrazine Complexes (Prof. L. Sacconi and A. Sabatini), 549
Irwin, Marjean, and others : Development of Resistance in Mice to Tumour Induction by S E Polyoma Virus, 615
Is *Nectria haemotococca* Berk. and Br. the Perfect Stage of *Fusarium oxysporum* Schl. forma *pisi* (Lindf.) S. and H ? (W L. Gordon), 903
Ishida, Takeo (Okada, Hideya, and) · Brighteners for Nickel Plating and Polarographic Maxima, 152
Islands (The Galápagos), a History of their Exploration (Joseph Richard Slevin), 365
Isolated Mammalian Cells Are Macromolecules required for Growth of Single ? (Ralph B. Gwatkin), 984
Isolated Nerve Fibres (Myelinated), of the Frog : Effect of Curare on Conduction in (Dr. Wolf D. Dettbarn), 891
Isolated Rat Diaphragm · Accumulation of Substrate by—a Possible Mechanism for the Anti-inflammatory Action of Corticosteroids (Prof Ira G. Wool), 728
Isolated Rat Liver Mitochondria : Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of (C. N. Graymore, A. H. Melhuish and A. L. Greenbaum), 392
Isolated Sensitized Mast Cells : Antigen-induced Damage to (Dr. I. Mota and W. Dias da Silva), 245
Isolated Spinach Chloroplasts : Induction Phenomena in Photosynthesis of (Dr Knud Vejlby), 652
Isolation of a Cytopathogenic Agent from Skin Lesions of Cattle (Dr. C. Huygelen, D. Thienpont and M. Vandervelden), 979
Isolation of Mutants of *Bacillus subtilis* requiring D-Glutamic Acid (Haruo Momose and Prof. Yônosuke Ikeda), 567
Isolation of a Phagocytosis-inhibiting Substance from Culture Filtrates of an Encapsulated *Staphylococcus aureus* (Dr. Stephen I. Morse), 102
Isomeric Chondroitin Sulphates : Identification of (J. B. Adams), 555
Isomers (Vitamin A), in the Liver of Rats and Chicks (O. R. Braekkan, H. Myklestad, L. R. Njaa and F. Utne), 312
Isoprenoid Alcohol : Dolichol, a Naturally Occurring (J. F. Pennock, F. W. Hemming and Prof. R. A. Morton), 470
Isotope Information Bureau : Opened by Sir Roger Makins, 1017
Isotope Technique (Radioactive) : Estimation of Mouse Tumour Blood Volumes employing a (F. S. Stewart and Dr. A. E. G. Pearson), 250
Isotopic Composition of Potassium (B R. F. Kendall), 225
Israelsohn, Dr. Wilma · Human Growth (Modes of Analysis of Human Growth Data), 19
Isted, G. A , and others · Radar 'Ring Angels' and the Roosting Movements of Starlings, 112

- Lethal Doses and Sterilizing Doses of X-Rays : Divergence between, with Progressive Development in *Habrobracon* Females (Dr. Howard E. Erdman), 254
- Lethality in Mice and Rats exposed to X-Rays : Inability of Methionine to affect (Prof. Zenon M. Bacq and Dr. Marie L. Beaumariage), 1064
- Letter Structure of the English Language (A. D. Baddeley, R. Conrad and W. E. Thomson), 414
- Lettuce Seed : Presence of Gibberellin-like Substances in (Dr. S. Blumenthal-Goldschmidt and Prof. A. Lang), 815
- Leucocytes (Human) : Culture of, on the Chorioallantoic Membrane of the Chick (Eugene Bell), 403
  - Infra-Red Spectra of Deoxyribonucleic Acids from (G. Zerbi, P. A. Bianchi and E. E. Polli), 964
- *Leuconostoc mesenteroides* : (+) S-Methyl-L-Cysteine Sulphoxide, an Inhibitor of Aspartic Acid Utilization in (Wilfred N. Arnold, Clayton J. Morris and John F. Thompson), 1051
- Leukaemia and Allied Diseases : Research on (Tata Memorial Trust Awards), 1020
- Level of Sulphydryl Compounds in Rat Liver following Feeding with Goitrogenous and Non-goitrogenous Cabbage (Jozef Sedlák), 892
- Level (Low-) Direct Current Signals : Transistor Modulators for (J. F. Evans), 626
- Level (Subnormal), of Carbonic Anhydrase in Blood of Carcinoma Patients? (Dr. N. W. H. Addink), 253
- Levels of Adenosine Triphosphate and Glycogen in the Liver : Changes in the, caused by Protein Administration (Dr. Catherine M. Clark, Dr. G. A. J. Goodlad, Dr. J. Chisholm and Dr. H. N. Munro), 719
- Levels of Ubiquinone and Ubichromenol in the Rat : Effect of Thyroxine and 2,4-Dinitrophenol on (E. E. Edwin, J. Green, A. T. Diplock and J. Bunyan), 725
- Levels (Normal Susceptibility), of *Anopheles pharoensis* Theobald to DDT and Dieldrin (Dr. F. Kuhlow), 410
- Levels (Various), of Bed Sediment : Haemoglobin Content of the Larvae of *Tendipes f l. plumosus* L. from (B. Czeczuga), 484
- Lever, Dr. J D. : A Method of Staining Sectioned Tissues with Lead for Electron Microscopy, 810
- Leverhulme Trust : Third Report (1956-59), 1026
- Levisohn, Dr. Ida : Effects of *Gibberella fujikuroi* on Fungal Root-Infections of *Pinus*, 987
- Levitus, R , and others · Some New Complexes of Rhenium, 233
- Levvy, Dr. G. A. : Mammalian α-L-Fucosidase, 472
- Lewin, Dr. Ralph A. : A *Spirochaeta* Phage, 901
- Lewis, Prof. D. : Nature and Exploitation of Plant Crop Resistance to Disease (Ways in which Fungal Variability may occur), 858
- Lewis, Dr. T. J., and Secker, Dr. P. E. : Effect of Cathode Surface Roughness and Oxidation on Arc Movement, 30
- Lettenmeyer, Dr. Lore (compiled by) : Atomic Terminology, a Dictionary of Nuclear Science, Engineering and Technology in Four Languages (English–German–French–Italian), *review* by Dr. J. B. Sykes, 67
- Liberation of Hexuronic Acid, Hexosamine and Hydroxyproline from Steer Hide by Stem Bromelain (E. A. Botan and T. B. Brother), 314
- Libraries (Manchester Public) : One hundred and seventh Annual Report (1958-59), 437
- Library (British), of Political and Economic Science : Annual Report for 1958-59, 520
- Library (National Reference), of Science and Invention, 934
- Library Association : Pamphlet No. 20, The Reproduction of Catalogue Cards (Philip S. Pargeter), 1020
- Library Association (North Western Group, Reference, Special and Information Section) : Russian Journals, 683
- Library Association (Medical), of America : Marcia G. Noyes Award given to Leslie T. Morton, 685
- Lieberman, M , and others : Ethylene Production by Tomato and Apple Fruits, 902
- Life : The Hand of—the Story of the Weizmann Institute (Ritchie Calder), *review*, 64
  - Interrelation of Tryptophan and Nicotinic Acid in Man during the First Month of (S. Auricchio, E. Quagliariello and A. Rubino), 639
- Life Insurance Co. (Metropolitan), New York : Statistical Bulletin, Vol. 40, New Weight Standards for Men and Women ; Fathers are Younger ; How Fatal Accidents occur in the Home ; Geographic Variations in Mortality by Cause, 445
- Life-like Preservation of Cytoplasmic Detail in Plant Cells (Dr. J Chayen, Prof. G J Cunningham, P. B. Gahan and A. A. Silcox), 1068
- Life-time (Radiative), of the Pyrene Dimer and the Possible Role of Excited Dimers in Energy Transfer Processes (Dr. B Stevens and E Hutton), 1045
- Lifshits, E. M., and Andronikashvili, E. L. : A Supplement to 'Helium', (translated from the Russian), *review* by Prof. J. F. Allen, 835
- Lifshitz, E. M. (Landau, L D., and) · Fluid Mechanics (translated from the Rusian by J B. Sykes and W. H. Reid), *review* by Dr. G. K. Batchelor 1000
- Ligand Exchange with its Metal Complex · Rate of, by a Polarimetric Method (B. Bosnich, Dr. F. P. Dwyer and Dr. A M. Sargeson), 966
- Light : Influence of, on Bacterial Flora of Roots (J. W. Rouatt and Dr. H. Katznelson), 659
  - Response of Larvae of *Calyptraea chinensis* (L) to (H. V. Wyatt), 328
  - Responsiveness of the Neurosecretory System of Larval Lampreys (*Petromyzon marinus*) to (Dr. Nezihe Oztan and Dr Aubrey Gorbman), 167
  - Velocity of, in a Magnetic Field (Prof R. V. Jones), 706
- Light (Polarized) : Discrimination of, by *Octopus* (The Visual System of *Octopus*), (M F. Moody and J. R. Parriss), 839
- Light (Ultra-Violet) : Electron Spin Resonance in Hydrogen Peroxide–Water Solutions at 90° K. irradiated with (Robert C. Smith and S J Wyatt), 226
  - Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with (Prof. F. S. Dainton and S. A. Sills), 879

Light (Visible) : Inactivation by, of Yeast sensitized by a Nucleic Acid Fluorochrome (David Freifelder and Prof. Robert B. Uretz), 731
Light and Adenosine Triphosphate in Bacterial Photosynthesis : Equivalence of (Dr. M. Losada, Dr. A. V. Trebst, S Ogata and Prof. Daniel I. Arnon), 753
Light and Electron Microscopy : Co-ordination of (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Symposium on), 672
Light-initiated Organic Synthesis, *review* by Prof. R. N. Haszeldine, 53
Lilley, J. S. : Appointed to a Research Fellowship in nuclear physics at the University of Birmingham, 937
Limpet (Slipper), *Crepidula fornicata* L., in Ireland : Occurrence of the (D. C. Arnold), 95
Limulus polyphemus (Horseshoe Crab) : Visual Pigment of the (Dr. Ruth Hubbard and Prof. George Wald), 212
Lindsay Memorial Lectures, 1958 (The Study of Man), (Prof. Michael Polanyi), *review* by F. I. G. Rawlins, 347
Linear Pinched Discharge : Growth of Surface Instabilities in a (Dr. R. Latham, J. A. Nation, F. L. Curzon and Dr. A. Folkierski), 624
Ling, Dr. Wang (Dr. Joseph Needham, with the collaboration of) : Science and Civilization in China, Vol. 3, Mathematics and the Sciences of the Heavens and the Earth, *review* by Prof. W. M. Smart, 36
Ling, Dr. Wang, and others : Heavenly Clockwork—the Great Astronomical Clocks of Medieval China, *review* by Dr F. A. B. Ward, 834
Linnean Society of London : Election of Officers and Council for 1960-61, 766
  Linnean Gold Medals presented to Dr. Libbie Henrietta Hyman and Dr. H. Hamshaw Thomas, 766
  Trail Award and Medal presented to Dr. Lawrence Ernest Rowland Picken, 766
  Election of Prof. Dr. C G. G. van Steenis and Dr. Robert E. Snodgrass as Foreign Members, 766
  Election of H. F. Comber, Dennis A. Kempson and Prof. Alexander Eric Kohts as associates *honoris causa*, 766
Linstead, Sir Patrick : Honorary membership of the Institute of Mining and Metallurgy conferred on, 854
Linton, W. H. : Polymeric Progress (Acetal Polymers), 441
Lipaemia (Haemorrhagic), in the Rat (Sven Punsar, Gottfried Härtel, Antti Louhija and Olli P. Heinonen), 888
Lipid Metabolism : Drugs affecting (Institute of Pharmacology of the University of Milan Symposium on), 127
Lipophilic Agar Cells : Diffusion of Proteins through (Dr. Ch. Wunderly), 885
Lipoprotein (Structural), of Rat Liver : Binding of a Hepatocarcinogen to the—its Bearing on the Immunological Theory of Cancer (J. W. Westrop and Prof. H. N. Green), 350
Lippman, F. : X-Ray Determination of Phillipsite in a Sediment Core from the Central Equatorial Pacific (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 3), 609
Lipson, Prof. H. : Elected president of the Manchester Literary and Philosophical Society, 854
Liquid Friction Constant (Dr. G. H. A. Cole), 301
Liquid Helium (Prof. K. R. Atkins), *review* by Dr. J. G. Valatin, 345
Liquid Sulphur · Structure of the Viscous Phase of (Dr. E. McLaughlin), 76
Liquid (Gas–) Chromatography : Non-Equilibrium Theory of (Dr. M. A. Khan), 800
Liquids (Supercooled) : Reduced Temperatures for Nucleation in (Dr. E. R. Buckle), 875
Literary and Philosophical Society (Manchester) : Election of Officers, 854
Literature : Zoological, *review* by Dr. Edward Hindle, 831
Literature in Russian Language : Bibliographical Index of, for 1958 (Academy of Sciences of the U S.S.R.), 359
Lithium (Body-centred Cubic) : An Energy Band Interpolation Scheme, with Application to (J. F. Cornwell and Dr. E. P. Wohlfarth), 379
Littler, Dr. W. B. : Rocket Propellants, *review*, 58
Littlewood, Dr A. B. : Gas Chromatography, 944
Liu, S. L. : Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat, 475
Liver : Changes in the Levels of Adenosine Triphosphate and Glycogen in the, caused by Protein Administration (Dr. Catherine M. Clark, Dr. G. A. J Goodlad, Dr. J. Chisholm and Dr. H. N. Munro), 719
  Cirrhosis of the, induced in Rabbits by Gastric Instillation of 3-Monohydroxycholanic Acid (Dr. Paul Holsti), 250
  Measurement of the Intrahepatic Shunted Flow of Blood in Cirrhosis of the (T. Nakamura, S. Nakamura and K. Tokita), 243
Liver (Rat) : Binding of a Hepatocarcinogen to the Structural Lipoprotein of—its Bearing on the Immunological Theory of Cancer (J. W. Westrop and Prof H. N. Green), 350
  Level of Sulphydryl Compounds in, following Feeding with Goitrogenous and Non-goitrogenous Cabbage (Jozef Sedlák), 892
Liver (Rat), in Experimental Cirrhosis : Histochemical and Biochemical Studies of, after Partial Hepatectomy (I. Bartók, Gy. Domján, E Horváth and Prof. B. Korpássy), 397
Liver of Rats and Chicks : Vitamin A Isomers in the (O. R. Braekkan, H. Myklestad, L R. Njaa and F. Utne), 312
Liver Cancer : Effect of 3-Amino-1,2,4-triazole on the Experimental Production of (Munemitsu Hoshino), 174
Liver Homogenates (E-Deficient) : Maintenance of α-Ketoglutarate and Succinate Oxidation in, by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr. Laurence M. Corwin and Dr Klaus Schwartz), 1048
Liver Mitochondria (Fresh and Aged) · Swelling of, as affected by Succinate, Adenine Nucleotides and Thyroxine (Dr. P. Emmelot, C. J. Bos, P. J. Brombacher and I H M. Reyers), 556
Liver Mitochondria (Rat) : Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of Isolated (C N. Graymore, A. H. Melhuish and A. L. Greenbaum), 392
  Effects of Fatty Acids on the $_{32}$P-Adenosine Triphosphate Exchange Reaction in (K. Ahmed and Dr. P. G. Scholefield), 1046
Liver Nitrogen in Mice : Thyroid-Powder Feeding and (Dr. A N Granitsas, M. Kukku and M. Konstantinidu), 890
Liver–SH Levels of Mice : Body-Weight and (Dr G. Calcutt), 84
Liverpool Geological Society, 1859-1959 (R G. C. Bathurst), 9
Living and Fossil Unicellular Algae and Aplanospores (D M Churchill), 493
Livingston, Prof. Robert, and Pugh, Dr. A. C. P. : Role of the Triplet State in the Photoreduction of Chlorophyll, 969
Ljunggren, Prof. Pontus : Fall-out Radioactivity in Southern Sweden, 655
Lloyd, H. : Reactor Fuel Element Technology (Fabrication of *Dido*-type Fuel Elements including the Mark III Version, and their Application to Power Reactors), 1026
Loading (Structural), in Factories (Department of Scientific and Industrial Research), 851
Loads (Snow), and Roof Designs, 603
Localization of Amino-acids for Histochemical Estimation (Helen M. Notovny and Robert G. Owens), 1057
Locher, F. W. : Sedimentpetrografische Untersuchung der Lotkerne 255 und 257 (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 4), 609
  Ein Beitrag zum Problem der Tiefseesande im westliche Teil des aquatorialen Atlantiks (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 5), 609
Lockspeiser, Sir Ben : *Obituary* of Sir David Pye, 433
Locus Coeruleus of the Mammalian Brain · Histochemical Demonstration of Ascorbic Acid in the (Dr. Nobuo Shimizu, Tomokazu Matsunami and Satoko Onishi), 479
Loeser (Guenter) Memorial Lecture of the United States Geophysical Research Directorate (Dr. Hans E. Hinteregger), 523
Loev, Dr. Bernard : Structure of Bhilawanol, 389
Lofthus, Alf . A New Predissociation in Nitrogen, 302
Logic (Symbolic), and Intelligent Machines (Edmund C. Berkeley), *review* by Dr. A. D. Booth, 422
London (Fritz) Award for Low-Temperature Research, 205
London Hospital Medical College : Appointment of Dr. K. W. Cross to the University of London chair of physiology, 522, 598
London School of Dental Surgery (Royal Dental Hospital of) : Appointment of Dr. H. J. J. Blackwood as reader in oral anatomy, 938
Long-Chain Effect ? · Proton Magnetic Resonance in a Series of Dimethyl Siloxane Polymers—a Specific (Dr. J. G. Powles and A. Hartland), 26
Long-lived Natural Radioactivity : Use of, as an Atmospheric Tracer (W. M Burton and N G. Stewart), 584
Long-range Clock Synchronization Experiments : Preliminary Flight Tests of an Atomic Clock in Preparation of (Friedrich H. Reder and Gernot M. R. Winkler), 592
Longstaff, J. V. L., and Singer, Dr. K. : Gaussian Wave Functions for the Hydrogen Molecule, 799
Lords, House of : Debate on the Antarctic, 212
  Debate on the Crowther Report, 577
Losada, Dr. M., and others : Equivalence of Light and Adenosine Triphosphate in Bacterial Photosynthesis, 753
Losee, Capt. F. L., and others : An Association between Dental Caries and certain Soil Conditions in New Zealand, 695
Loss of Specificity on Passage of Immunologically Competent Cells in the Chick Embryo (Sir Macfarlane Burnet and Georgiana Boyer), 175
Losses (Food), in Field and Store (Nutrition Society Symposium on), 685
Lotkerne 255 und 257 : Sedimentpetrografische Untersuchung der (F. W. Locher), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 4), 60
Loughborough College of Technology : Appointment of Dr. W. F. Floyd as first head of the Department of Ergonomics and Cybernetics, 523
Loughnan, C. J. : Motion of Geomagnetic Field Lines, 33
Louhija, Antti, and others : Haemorrhagic Lipaemia in the Rat, 888
Lovell, Prof. Reginald : The Aetiology of Infective Diseases, *review* by Dr. G. Lapage, 581
Lovering, J. F. : Origin of Tektites—High-Temperature Fusion of Possible Parent Materials for Tektites, 1028
Low, Prof. Barbara W., and Einstein, J. Ralph : Symmetry of Insulin Dimers and Hexamers, 470
Low-Energy Nuclear Physics, *review* by Dr. E. Bretscher, 58
Low Frequency (Very) Geomagnetic Fluctuations : Influence of Geological Features on (H. J. Duffus, J. A. Shand and Sir Charles Wright), 141
Low-level Direct Current Signals : Transistor Modulators for (J. F. Evans), 626
Low Sea-Level Air Pressure : New Record (C L. Jordan), 283
Low-Temperature Photoproducts : Regeneration of Visual Pigments from their (Dr. C. D. B. Bridges), 292
Low-Temperature Research : Fritz London Award for, 205
Low Temperatures : Coloured Sulphur Deposits at (Dr. B. Meyer and Prof. E. Schumacher), 801
Low Temperatures (Very) : Reaction between Copper and Solid Oxygen condensed at, from a Gas Discharge (Jerome Kruger and William J. Ambs), 794
Lowenstein, Prof. O. : Sensory Specialization in Response to Environmental Demands, 688
Lower Olefines : The Industrial Chemistry of the (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 285
Lower Olfactory Pathway of the Toad : Potential Oscillations in the (Dr. S F. Takagi and Dr T. Shibuya), 724
Lower Tertiary Microfossils from McMurdo Sound, Antarctica (Dr. Lucy M. Cranwell (Mrs Watson Smith), Dr. H. J. Harrington and I. G. Speden), 700
Lowry, G C. . Elected to Fellowship of the Imperial College of Science and Technology, London, 522
Lubricant : Action of Graphite as a (W. Bollmann and J. Spreadborough), 29
Lucilia cuprina Wied. . Genetics of Resistance to Dieldrin in (G. J. Shanahan), 181
  Selection for High-Order Resistance to 'Dieldrin' in (G. J. Shanahan), 100
Ludwig, T. G., and others : An Association between Dental Caries and certain Soil Conditions in New Zealand, 695
Lunar Surface The (V. A. Firsoff), 826 ; (Dr. B E. J. Pagel), 826
Lung (Chopped Guinea Pig) : Inhibition of the Anaphylactic Release of Histamine from, by Chymotrypsin Substrates and Inhibitors (Dr. K. F Austen and Dr. W. E. Brocklehurst), 866
Luria, Prof. S. E. · Elected a member of the United States National Academy of Sciences, 773
Lutetium (Rare-Earth Elements, Lanthanum to) : Abundances of the, in Chondritic Meteorites (Dr. R. A. Schmitt, A. W. Mosen, C. S. Suffredini, J. E. Lasch, Dr R. A. Sharp and D. A. Olehy), 863

Lycopersicum . Interspecific Hybrids of (Dr Donald Michie), 1071 ; (Helgi Nirk), 1071
Lyle (Thomas Ranken) Medal for 1959 of the Australian Academy of Science presented to Prof. E. S. Barnes, 519
Lymphogranuloma (Trachoma, Inclusion Blennorrhoea and) Transmission of the Viruses of, to Mice (Dr. E. Weston Hurst and P. Reeve), 336
Lynden-Bell, D. : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Lynn, Dr. R. (Griew, Dr S , and) : Construct 'Reactive Inhibition' in the Interpretation of Age Changes in Performance, 182
Lysis (Streptomycin-induced), of Penicillin-treated *Staphylococci* (Dr. R Hancock), 658
Lysozyme and Egg-White Administration Increase in 'Alkaline' Ribonuclease of Rat Kidney Cortex after (Dr. T. Maack, Dr. R. Brentani and Dr. M. Rabinovitch), 158
Lytic Blood-Typing Tests . Bacterially Mediated False-Positive Reactions in (Prof. Clyde Stormont, Yoshiko Suzuki and W. J. Miller), 247

MAACK, Dr T., and others : Increase in 'Alkaline' Ribonuclease of Rat Kidney Cortex after Lysozyme and Egg-White Administration, 158
Macaca irus : Haptoglobin Types in (Lars Beckman and Gunilla Cedermark), 643
Macan, Dr T. T · A Guide to Freshwater Invertebrate Animals, *review* by Dr J P Harding, 345
McAulay, I. R. (Delaney, Dr. C F. G , and) : Radiocarbon Dating System using Scintillation Techniques, 204
McBurney, Ralph E . Appointed head of the Technical Information Service of the National Research Council of Canada, 17
Maccabaeans, Society of : Meldola Medals for 1959 awarded to Dr. J. I. G. Cadogan and Dr. T. C. Waddington, 519
McCallan, S E A , and others (edited by) · Plant Pathology, Problems and Progress, 1908-1958, *review* by W. C. Moore, 47
McCloy, D. : Appointed lecturer in mechanical engineering at the Queen's University, Belfast, 767
McCrea, Prof. W. H. . The Interpretation of Cosmology, 1035
McDermott, E. D. · Awarded a Gold Medal of the Institute of Mining and Metallurgy, 854
MacDonald, Dr. D K C. : Elected a Fellow of the Royal Society, 11
McDonald, I. W. : Nitrogen in Tropical Agriculture (Nitrogen Intake and Excretion of Grazing Animals), 941
Macdonald, J D. A Laboratory and Field Manual of Ornithology, *review*, 65
McDonald, Dr M P. (Collison, Dr Roger, and) . Broadening of the Water Proton Line in High-Resolution Nuclear Magnetic Resonance Spectra of Starch Gels, 548
MacDowall, J. : Results of the Royal Society's International Geophysical Year Expedition (Work done in Seismology, Glaciology and Meteorology), 191
Macer, Dr. R C. F : Nature and Exploitation of Crop Plant Resistance to Disease, 857
Maceration (Collagenase), of Kidney for Microdissection (Nancy J. Hayward), 403
Machines (Intelligent) : Symbolic Logic and (Edmund C Berkeley), *review* by Dr A D. Booth, 422
Machlis, Leonard (edited by, in association with John G. Torrey) : Annual Review of Plant Physiology, Vol 10, *review* by Prof. W Stiles, 747
MacIntosh, Dr. D. · Medical Research in the British Caribbean (Diabetes mellitus), 862
McIntyre, A D (Burdon-Jones, C , and) : *Stereobalanus*, a Genus New to the Old World, 491
MacIver, A. M · Appointed to the newly established chair of philosophy in the University of Southampton, 284
MacIver, Dr. - , and Back, Dr. -. : Medical Research in the British Caribbean (Megaloblastic Anaemia in Malnourished Infants), 863
MacKay, Dr. Donald M. Appointed to the new Granada research chair of communication in the University College of North Staffordshire, 599 ; work of, 599
McKay, H A. C : The Cento Institute of Nuclear Science in Tehran, 513
McKeller, Dr Andrew : *Obituary* by Prof. R O. Redman, 1014
McKenzie, A. W. : Visco-Elastic Systems (Influence of Inter-Fibre Bonding), 942

McLaughlin, Dr E. Structure of the Viscous Phase of Liquid Sulphur, 76
MacLennan, A. P., and others : Mycosides, a New Class of Type-Specific Glycolipids of *Mycobacteria*, 887
McLintock, Dr. W. F. P : *Obituary* by Prof. C. F. Davidson, 200
McManus, W R. (Goldhammer, Helen, and) : Effects of Non-Ionic Surfactants upon Animal Tissues, 317
McMurdo Sound, Antarctica . Lower Tertiary Microfossils from (Dr Lucy M. Cranwell (Mrs. Watson Smith), Dr. H. J. Harrington and I. G. Speden), 700
McNeill, Prof. K. G., and Trojan, O A. D. : Caesium-137 in Toronto Milk during 1959, 399
Macpherson, Dr. I. A , and Allner, K. : *L* Forms of Bacteria as Contaminants in Tissue Culture, 992
Macromolecules required : Are, for Growth of Single Isolated Mammalian Cells ? (Ralph B Gwatkin), 984
Macronucleus of *Spirostomum* and *Blepharisma* : Effect of Centrifugation on the (Prof B. R. Seshachar), 333
Macroscopic Scale Quantum Effects on a, *review* by Dr. J. G. Valatin, 345
Madshus, K., and Baarli, J. : Radiocaesium and Potassium-40 in Norwegian-produced Milk, 527
Maggs, Dr. F A. P., and others : Adsorption of Helium on Carbons—Influence on Measurement of Density, 956
Magnesium in Human Cerebrospinal Fluid : Calcium and (Dr. G Hunter and Honor V. Smith), 161
Magnetic Annealing, 439
Magnetic Field . Velocity of Light in a (Prof. R. V. Jones), 706
Magnetic Observatory : The Watheroo (Melbourne), 606
Magnetic Properties (Electrical and), of β-Carotene Triiodide (Dr Charles M Huggins and Dr. Oliver H. LeBlanc, jun.), 552
Magnetic Resonance : Nuclear—Applications to Organic Chemistry (Prof. J. D. Roberts), *review* by Prof E. R. Andrew, 55
Magnetic Resonance (Nuclear) Optical Detection of (J Brossel), 440
Magnetic Resonance (Proton), in a Series of Dimethyl Silozane Polymers—a Specific Long-Chain Effect ? (Dr. J. G Powles and A. Hartland), 26
Magnetic Resonance Spectra (High-Resolution Nuclear), of Starch Gels : Broadening of the Water Proton Line in (Dr. Roger Collison and Dr. M. P McDonald), 548
Magnetization (Natural Remanent), of some Welsh Slates : Anisotropy of Susceptibility and the (M. D Fuller), 791
Magnetohydrodynamics (Plasma Physics and), and their Applications to Controlled Thermonuclear Reactions . Bibliography on (J. D. Ramer), 522
Magneto-Ionosphere Disturbances (Academy of Sciences of the U.S.S.R.), 359
Maintenance of α-Ketoglutarate and Succinate Oxidation in E-Deficient Liver Homogenates by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr Laurence M Corwin and Dr Klaus Schwartz), 1048
Maisin, Prof. J , and others . Yeast Ribonucleic Acid and its Nucleotides as Recovery Factors in Rats receiving an Acute Whole-Body Dose of X-Rays, 487
Maitland, Prof H. B (Postlethwaite, Dr. R , and) : Eclipse Phase of Vaccinia Virus, 335
Majer, Dr. J. R. : Appointed lecturer in chemistry at the University of Birmingham, 937
Major Source of Electrical Energy ? . Fuel Cells—Will they soon become a (F T. Bacon), 589
Malaya . Medical Research in, 944
Malaya, Government of the Federation of, and others : International Conference on Natural Rubber Research, 767
Malcolm, Wing-Comdr. J. E. : Korotkov's Sounds—Action of the Heart, 723
Male, J C., and Prior, J. R. : Intrinsic Recombination Radiation in Diamond, 1037
Male (Adult), and Nymph Development Stages of *Triatoma infestans* . Non-Identity of Triosephosphate Dehydrogenase of (Prof M. Agosin, A. Neghme and N Scaramelli), 1052
Male Fern in Pharmacognosy . Indian Substitutes of (Prof. P. N. Mehra and T C Mittal), 722
Male Sex Organ in certain Fern Species · Purification of a Specific Inducer of the (Ross B Pringle, Ulrich Naf and Armin C. Braun), 1066
Malformations : Congenital (International Medical Congress, Ltd., International Conference on), 685
Malinowski, Edmund · Genetyka, *review* by Dr. P. S. Hudson, 507
Malkani, T. M. . Fellowship of the City and Guilds of London Institute conferred on, 13
Mallon, H D , and Runciman, I. G. : Optical Properties of Bismuth, 709
Malonaldehyde–Thiobarbituric Acid Reaction . Estimation of 3-Deoxy Sugars by means of the (Dr. Morris A Cynkin and Dr. Gilbert Ashwell), 155
Mammalian Brain : Histochemical Demonstration of Ascorbic Acid in the Locus Coeruleus of the (Dr. Nobuo Shimizu, Tomokazu Matsunami and Satoko Onishi), 479
Mammalian Cells (Isolated) Are Macromolecules required for Growth of Single ? (Ralph B Gwatkin), 984
Mammalian α-L-Fucosidase (Dr G. A. Levvy), 472
Mammals . East Anglian (Lord Cranbrook), 770
Man Actinomycins and their Importance in the Treatment of Tumours in Animals and (New York Academy of Sciences Conference on), 771
  The Antecedents of (Prof. Sir Wilfrid E. Le Gros Clark), *review* by Dr G G. Simpson, 665
  Chromosome Abnormalities in (Dr. C. O Carter), 683
  Hazard of Tritium as a Deoxyribonucleic Acid Label in (R. Oliver and Dr. L. G. Lajtha), 91
  Interrelation of Tryptophan and Nicotinic Acid in, during the First Month of Life (S Auricchio, E. Quagliariello and A. Rubino), 639
  Radiation, Genes and (Prof Bruce Wallace and Prof. Th. Dobzhansky), *review* by Dr A. G. Searle, 109
  A Simplified Method for the Study of Chromosomes in (C. Bottura and I Ferrari), 904
  The Study of (Prof Michael Polanyi), *review* by F. I. G. Rawlins, 347
Man among the Primates, *review* by Dr G G Simpson, 665
Man and Monkey Serotonin Content of the Pineal Glands of (Prof Nicholas J Giarman, Daniel X. Freedman and Luis Picard-Ami), 480
Man's Conquest of the Stars (Pierre Rousseau), *review* by D. H. P. Jones, 69
Man-powered Flight (Financial grants from the Royal Aeronautical Society Man Powered Aircraft Group, for promising projects designed to further the achievement of), 1020
Management : Organization and Methods, a Service to (edited by G E. Milward), *review* by E. S Hiscocks, 62
Management of Research Personnel, *review* by E. S. Hiscocks, 579
Management, Education and Business Studies, 743
Management Education and of Business Studies : The Future Development of—Revision of Joint Examination Schemes (Ministry of Education, Circular 1/60), 743
Management Studies : Report of the Working Party appointed to examine the Scheme of (Ministry of Education, Appendix to Circular 1/60), 743
Management (Research) · The Human Element in (Dr. B. E Noltingk), *review* by E. S Hiscocks, 579
Managers (Works), Institution of . Appointment of Lawrence Sutton as education officer, 206
Manchester College of Science and Technology . Summer School in Modern Methods of Crystal Structure Determination, 766
  Retirement of Prof. H Wright Baker from the chair of mechanical engineering in the Faculty of Technology of the University of Manchester, 1015
  Appointment of W Johnson to the chair of mechanical engineering in the Faculty of Technology of the University of Manchester, 1015
Manchester Literary and Philosophical Society : Election of Officers, 854
Manchester Museum : Annual Report for 1958-59, 521
Manchester Public Libraries · One hundred and seventh Annual Report (1958-59), 437

Mandelic Acid : Acidic Dissociation Constant of Alcoholic Hydroxyls of Oxycarboxylic Acids— (Dr. M. T. Beck and M. Halmos), 388
Mandelstam, Dr. S. : Appointed to the newly established chair of mathematical physics in the University of Birmingham, 937
Manganese Edetate . Effect of, on Blood Formation in Rats (T. J. Sullivan), 87
Manganese Toxicity in *Grevillea robusta* (Dr. R. Child and A N Smith), 1067
Mani Pintar (Groundnut Variety) : Genetic Instability and Outcrossing in the (J. Smartt), 1070
Mann, Dr. F G : The Organic Chemistry of Sulphur, *review*, 53
Mansfield, A. W., and Fisher, H D : Age Determination in the Harbour Seal, *Phoca vitulina* L , 92
Mantle (Upper) · Structure of the, as derived from the Travel Times of Seismic *P* and *S* Waves (Dr I Lehmann), 956
Manton, Prof. I Co-ordination of Light and Electron Microscopy (Co-ordinated Use of Electron Microscopy and a group of Optical Techniques in Plant Cytology), 672
Mapping Britain (Seventy-fifth Anniversary Exhibition of the Royal Scottish Geographical Society), 523
Marcinkiewicz, S., and others : Ubiquinones and Ubichromenols in the Rat, 554
Marcuse, Dr. Reinhard . Antioxidative Effect of Amino-Acids, 886
Marder, Dr. L. : Appointed a lecturer in mathematics at the University of Southampton, 284
Mare (Pregnant) Serum Gonadotropin · Effect of *p*H on Biological Activity of (Bengt H. Persson and Stig E J. Melander), 163
Marine Biological Association of the United Kingdom · Grant of 30,000 dollars from the Rockefeller Foundation, for the purchase of research equipment for use in the Plymouth laboratory, 361
Marine Biology or Oceanography : Grants for research in (Challenger Society), 854
Marine Laboratories (Development Commissioners Scheme), (Challenger Society and representatives from the) . Joint Meeting in Cambridge, 685, 938
Marine Nuclear Propulsion for the United Kingdom, 122
Maritome Museum (National), Greenwich : Appointment of Lieut.-Comdr. D. W Waters as curator of navigation and astronomy, 12
Markham, R L., and others Antithromboplastin in Human Serum and Plasma, 248
Marriage-Rate of American College Graduates, 22
Marriott, Dr F. H. C. · Sensory Specialization in Response to Environmental Demands (Sensitivity Limits of Photoreceptors), 689
Marshall, Dr N. B. : How Animals Move, *review*, 921
Marshall, Dr. R. D. (Bishop, Dr. A. C., and) : Optical Properties of the αω-Dimethanesulphonoxyalkanes, 74
Marshall, Dr. R. D , and Neuberger, Prof. A. Amide Nitrogen Content of Ovomucoid, 311
Marsilea : Foliar Abnormalities, including Repeated Branching and Root Formation, induced by Kinetin in Attached Leaves of (Dr. A. Allsopp and Alicja Szweykowska), 813
Marston, J. E . Suffolk Ponds and Pond Animals, 771
Martens, H. E., and Kotlensky, W. V. . Tensile Behaviour of Pyrolytic Graphite at 2,750° C , 960
Martin, A E. . Nitrogen in Tropical Agriculture (Nitrogen Transformations in Soil), 941
Martin, A. E., and Skyring, G W. : Nitrogen in Tropical Agriculture (Losses of Nitrogen from the Soil/Plant System), 941
Martin, A. E. (Hubble, G. D , and) : Nitrogen in Tropical Agriculture (Nitrogen Status of Queensland Soils), 941
Martin, A R. H. . A Mesozoic Microflora from South Africa, 95
Martin, E. M , and others : Crystallization of Purified Mouse Encephalomyocarditis Virus Particles, 908
Martin, Dr. G. M., and others : Vanadium Catalysis of the Oxidation of Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles, 884
Martin, K. G : Visco-Elastic Systems (A Micro-Viscometer and Factors in its Operation), 943
Mason, Dr. Brian : Origin of Chondrules and Chondritic Meteorites, 230
Mason, Dr B. J. : Awarded the Hugh Robert Mill Medal and Prize for 1959 of the Royal Meteorological Society, 440
Mason, Revil J., and others : Australopithecine Tools, 205
Mass of Elementary Particles (Dr S. E. Horning), 708
Mass Transfer (Indian Institute of Science Symposium on), 691
Massachusetts General Hospital, Boston · Grant of £50,000 from the Wellcome Trust, for the establishment of a Henry S. Wellcome research chair in medical science, 937
Massey, C. . Visco-Elastic Systems (Tests on several Thermoplastics with reference to their Suitability for Model Structural Analysis), 943
Massey, H. S. H : Russian Machine Translation Dictionary, 852
Masson, D. Ryle (edited by) · Register of Current Scientific Research at South African Universities, 1959 (South African Council for Scientific and Industrial Research), 854
Mast Cell Granules : A Specific Stain for (Dr B. G. Radden), 400
Mast Cells Antigen-induced Damage to Isolated Sensitized (Dr. I. Mota and W. Dias da Silva), 245
Master of Microbiology, *review* by Prof B C. J. G. Knight, 44
Material (Genetic) : Exchange of—Mechanisms and Consequences (Cold Spring Harbor Symposia on Quantitative Biology, Vol. 23), *review* by Prof Kenneth Mather, 832
Material (Recording), for X-Ray Microscopy : Silver-activated Nitrocellulose as (Saara K. Asunmaa), 1036
Materials (Agricultural), in the United Kingdom, 1958-59 : Strontium-90 in Milk and (Agricultural Research Council), 852
Materials (Brittle), for Microdiffraction : A Technique for Sampling Oxide Layers and (A. M. Adams, M A. Silva and Veronica M. Spiers), 147
Materials (Non-Infectious Adenovirus) : Antigenic Structure of (Dr. H. G. Pereira), 571
Materials (Possible Parent), for Tektites · High-Temperature Fusion of (Origin of Tektites), (L. F. Lovering), 1028
Mathematical Functions : Tables of Physical and Chemical Constants and some (Dr. G. W. C. Kaye and Dr. T. H. Laby), twelfth edition, *review* by T. M. Yarwood, 67
Mathematical Works . Stevin's, *review* by Dr. J F. Scott, 60
Mathematics : Physics and (edited by Donald J. Hughes, J. E Sanders and J Horowitz), Vol. 3 (Progress in Nuclear Energy, Series 1), *review* by Dr. E. R. Rae, 68
Mathematics and the Conduction of Heat in Solids, *review* by Prof. L. S. Goddard, 421
Mathematics, Education and Industry—a Record of a Conference of Teachers, Research Scientists and Industrialists, held at the University of Liverpool (1959), 1017
Mathematics and the Sciences of the Heavens and the Earth (Dr. Joseph Needham, with the collaboration of Dr Wang Ling), (Science and Civilization in China, Vol. 3), *review* by Prof. W. M. Smart, 36

  - Principles of the Extraction of (Dr. D. J G. Ives), 765
- Metals (Amphoteric) : Photo-stimulated Emission of Exo-electrons from the Surface Layer of, reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide (J. Wawrzyniak and Dr. B. Sujak), 467
- Metals (Solid) : Determination of Adsorption in Double Layers involving (Dr. Erik A. Blomgren and Dr John O'M. Bockris), 305
- Meteorites Exist : Do, Consisting Predominantly of Feldspar ? (Prof. K. Przibram), 300
- Meteorites (Chondritic) : Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in (Dr. R. A. Schmitt, A. W. Mosen, C. S. Suffredini, J. E. Lasch, Dr. R A. Sharp and D. A. Olehy), 863
  - Origin of Chondrules and (Dr Brian Mason), 230
- Meteorites (Iron) : Exposure Ages for (Oliver A. Schaeffer and David E. Fisher), 1040

Meteorological Institute of Belgium (Royal) : Ionospheric Observations over Belgium during the International Geophysical Year, 203
Meteorological Society (Royal) : Buchan Prize for 1955-59 awarded to Dr. R. J. Murgatroyd, 440
  Hugh Robert Mill Medal and Prize for 1959 awarded to Dr. B. J. Mason, 440
  Darton Prizes—(*a*) Home Awards, first prize to Dr. C. J Adkins, and second prize to Dr. J. A. Funk ; (*b*) Canadian Awards, first prize jointly to R. H. Douglas and Dr. W. Hitschfeld, and second prize to D. K. A. Gillies, 440
  Symposium on Convection, 604
  Symposium on Agricultural Meteorology, 604
Meteorological Use of Pulsed Doppler Radar (J. R. Probert-Jones), 271
Meteorology : Agricultural (Royal Meteorological Society Symposium on), 604
Methacrylates (Water-Soluble), as Embedding Media for Preparation of Ultra-Thin Sections (Dr. O Wichterle, Dr. P Bartl and Dr M. Rosenberg), 494
Methacrylic Acid (Crystalline) : Polymerization of, initiated by Ultra-violet Radiation (Dr. C. H. Bamford, A. D. Jenkins and J. C. Ward), 713
Methane Exhalation in Sheep (E. Cresswell), 560
Methionine : Inability of, to affect Lethality in Mice and Rats exposed to X-Rays (Prof. Zenon M Bacq and Dr. Marie L. Beaumariage), 1064
Methionine labelled with Sulphur-35 from Muscle Tissue and Mitochondria : Release of (Dr. R. Zák and Dr I. Drahota), 973
Method for Characterizing *Pseudomonas solanacearum* (A C. Hayward), 405
Method of Staining Sectioned Tissues with Lead for Electron Microscopy (Dr. J. D. Lever), 810
Method (An Ion-Exchange Resin), for the Fractionation of Alcoholic Plant Extracts (Dr. Dalton Wang), 326
Method (A Micro-) for Testing for Niacin (E. Medveczky), 332
Method (A New) in the Theory of Superconductivity (N N. Bogoliubov, V. V Tolmachev and D. V. Shirkov), translated from the Russian, *review* by Dr. C. G. Kuper, 833
Method (Polarimetric) : Rate of Ligand Exchange with its Metal Complex by a (B. Bosnich, Dr F. P Dwyer and Dr A. M. Sargeson), 966
Method (A Rapid), for Qualitative Analysis of Volatile Mercaptan Mixtures (John F. Carson, William J. Weston and Jack W. Ralls), 801
Method (Replica) : Size Distribution of Tobacco Smoke Droplets by a (W. J. Harris), 537
Method (A Simple), for Obtaining Perforated Supporting Membranes for Electron Microscopy (V. Drahoš and A. Delong), 104
Method (A Simplified), for the Study of Chromosomes in Man (C. Bottura and I. Ferrari), 904
Method (A Systematic), for the Construction of Error-correcting Group Codes (Prof. R B. Banerji), 627
Method (The Tesla-coil), for Producing Free Radicals from Solids (Dr. C. H. Bamford, A. D. Jenkins and J. C. Ward), 712
Methoden der Molekulphysik und ihre Anwendungsbereiche (Dr. H. Preuss), *review* by Prof. C. A. Coulson, 54
Methodology and Superconductivity, *review* by Dr. C. G. Kuper, 833
Methods : Organization and—a Service to Management (edited by G. E. Milward), *review* by E. S Hiscocks, 62
Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds (Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry Symposium on), 131, *erratum*, 206
Methods (Modern) of Crystal Structure Determination (Manchester College of Science and Technology Summer School in), 766
Methods (Scientific), in the Care of Works of Art (F. I. G. Rawlins), 437
Methods (Statistical), in Biological and Medical Sciences, *review* by R. M. Cormack, 746
Methods (Statistical), in Biology (Dr. Norman T. J. Bailey), *review* by R. M. Cormack, 746
2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone : Synergetic Action of, on Morphine Dihydrocodeine and Aminopyrine Analgesia (Dr. E. Fischer, J. L. J. Szabó and M. Stamburgo), 893
Methyl Acetylene : Decomposition of (F. Fitzgerald), 386
Methyl Cytidine from the Ribonucleic Acid of *Anacystis nidulans* (Dr. B. B. Biswas and J. Myers), 238
5-Methyl-5'-deoxycytidylic Acid : Enzymatic Deamination of 5-Deoxycytidylic Acid and of, in Growing and in Non-growing Tissues (Dr. Eduardo Scarano, Massimo Talarico, Luisa Bonaduce and Benita De Petrocellis), 237
(+) S-Methyl-L-Cysteine Sulphoxide, an Inhibitor of Aspartic Acid Utilization in *Leuconostoc mesenteroides* (Wilfred N. Arnold, Clayton J. Morris and John F. Thompson), 1051
Methylene Blue : Selective Elimination of Single Sense Cells with (Dr. Ulrich Clever), 812
γ-Methyleneglutamic Acid : Degradation of, by Plants (Dr. L Fowden), 897
Methylpentynol : Effect of, on Acetylcholine in the Rat's Brain (Giancarlo Pepeu and Prof. Nicholas J. Giarman), 638
Metropolitan Life Insurance Co , New York : Statistical Bulletin, Vol. 40, New Weight Standards for Men and Women ; Fathers are Younger ; How Fatal Accidents occur in the Home ; Geographic Variations in Mortality by Cause, 445
Meyer, Dr. B., and Schumacher, Prof. E. : Coloured Sulphur Deposits at Low Temperatures, 801
Meyrick, Edward (described by) : Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History), (J F. Gates Clarke), Vol. 3, Tortricidae, Olethreutidae, Noctuidae, *review* by R. G. Fennah, 188
Meyrick's Microlepidoptera, *review* by R. G Fennah, 188
Miall, L. M. : Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds, 131
Mice : Body-Weight and Liver-SH Levels of (Dr. G Calcutt), 84
  Development of Resistance in, to Tumour Induction by *S E* Polyoma Virus (Sarah E. Stewart, Bernice E Eddy, Marjean Irwin and Stephanie Lee), 615
  Enhanced Resistance of, to Infection with *Pasteurella pestis* following Vaccination with Fractions of Phenol-killed Tubercle Bacilli (Prof. David W. Weiss), 1060
  Enhancement of Staphyloccal Virulence for, by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin (Dr. Daniel Amsterdam and Dr S. Stanley Schneierson), 101
  Inability of Thiotaurine to protect, against Ionizing Radiation (Dr. D, Cavallini and L. Tentori), 254
  Thyroid-Powder Feeding and Liver Nitrogen in (Dr. A. N. Granitsas, M. Kukku and M. Konstantinidu), 890
  Transmission of the Viruses of Trachoma, Inclusion Blennorhoea and Lymphogranuloma to (Dr. E Weston Hurst and P. Reeve), 336
Mice (Inbred and Hybrid), reared at Two Different Temperatures : The Growth in Weight and Tail Length of (Prof. G. A. Harrison, R. J. Morton and Dr. J. S Weiner), 446
Mice and Rats exposed to X-Rays : Inability of Methionine to affect Lethality in (Prof. Zenon M Bacq and Dr. Marie L. Beaumariage), 1064
Michailow, Prof A A. : Elected a member of the Astronomy Section of the Leopoldina Academy of Natural Sciences, 766
Michie, Dr. Donald : Interspecific Hybrids of *Lycopersicum*, 1071
Michot, Dr P. : Orogens, 690
Micro Gas Chromatograph (Prof. Nobuki Sasaki, Kimimichi Tominaga and Masaya Aoyagi), 309
Microbial Biochemistry : Annual Ciba Lectures in (Dr. M. R. J. Salton), 284
Microbial Cell Walls (Annual Ciba Lectures in Microbial Biochemistry), (Dr. M R J. Salton), 284
Microbiological 11β-Hydroxy Dehydrogenation of Corticosterone (M. Shirasaka, R. Takasaki and M. Tsuruta), 390
Microbiological Reactions : Steric Course of (edited by G. E. W. Wolstenholme and Cecilia M. O'Connor), *review* by Prof. D. C Harrison, 835
Microbiology : Annual Review of (edited by Charles E. Clifton, Sidney Raffel and Mortimer P Starr), Vol 13, *review* by Dr. B. A. Newton, 49
  Master of, *review* by Prof. B. C. J. G Knight, 44
Microdiffraction : A Technique for Sampling Oxide Layers and Brittle Materials for (A. M. Adams, M. A. Silva and Veronica M. Spiers), 147
Microdissection : Collagenase Maceration of Kidney for (Nancy J. Hayward), 403
Micro-electrodes ('Weightless'), for Recording Extracellular Unit Action Potentials from the Central Nervous System (Prof B. Delisle Burns and Dr J G. Robson), 246
Micro-electrophoresis of Human White Cells and Platelets (Dr. William P. Creger and Phyllis Menna Thomas), 171
Microflora (A Mesozoic), from South Africa (A. R H. Martin), 95
Microfossils (Lower Tertiary), from McMurdo Sound, Antarctica (Dr. Lucy M. Cranwell (Mrs. Watson Smith), Dr. H. J. Harrington and I. G. Speden), 700
Micrography (Ciné) : An Apparatus for Panning in (Dr. W. H. Hughes and Dr. P. N. Cardew), 258
Microlepidoptera : Meyrick's, *review* by R. G. Fennah, 188
Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick : Catalogue of the Type Specimens of (J. F. Gates Clarke), Vol 3, Tortricidae, Olethreutidae, Noctuidae, *review* by R. G. Fennah, 188
Micromethod for Testing for Niacin (E. Medveczky), 332
Micromosaic Patterns in Single Crystals of Potassium Chloride containing Barium Chloride (J. Ewles and J. B. Dawson), 381
<2 Micron Fractions in a Sediment Core from the Mindanao Trough : Mineralogical Composition of some (J. Ch. L. Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 5), 609
Micro-organisms : Organization, Control and Synthesis in, *review* by Dr. B. A. Newton, 49
Micropulsations (Regular), of the Earth's Field at the Equator (Rosemary Hutton), 955
Microquantitative Infra-Red Analysis—Application to Gas Chromatographic Fractions (J. E. Stewart, R. O Brace, T. Johns and W. F. Ulrich), 628
Micro-reproduction : Document, 602
Microscope (Electron) : Techniques and Applications of the (Cornell University Summer Laboratory Course in), 127
  Yolk Formation in Oocytes of *Patella coerulea* L. and *Aplysia depilans* L. as observed in the (A Bolognani), 490
Microscopic Structure of some Wools : Anomalies in the (T. D. Brown and W. J. Onions), 93
Microscopical Society (Royal), and the Electron Microscopy Group of the Institute of Physics : Symposium on the Co-ordination of Light and Electron Microscopy, 672
Microscopy (Electron) : Co-ordination of Light and (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Symposium on), 672
  A Method of Staining Sectioned Tissues with Lead for (Dr. J. D. Lever), 810
  A Simple Method for Obtaining Perforated Supporting Membranes for (V Drahoš and A. Delong), 104
Microscopy (Electron), and the Crystal Structure of Indanthrene (Lewis T. Chadderton), 541
Microscopy (X-Ray) : Silver-activated Nitrocellulose as Recording Material for (Saara K. Asunmaa), 1036
Microsporum gypseum : Perfect Stage of (Dr. D. M. Griffin), 94
Microtexts as Media for Publication (Hertfordshire County Council Technical Information Service), 602
Middlesex Hospital Medical School, London : Appointment of Dr. J. H. Green as reader in physiology, 938
Midgley, Dr. D : The Possibility of a Self-sustaining Corbino Disk, 377
Migrants (Insect), High in the Air : Mortality and Viability of (L. R. Taylor), 410
Migration (Insect), and Dispersal by Flight : A Basis for a General System of (C. G. Johnson), 348
Migratory Ducks : Food Habits of (Harry G. Anderson), 17
Mihaescu, Dr. C., and Mihaescu, Edith : Seromucoid Contents of Human Bile, 394
Mihaescu, Edith (Mihaescu, Dr. C., and) : Seromucoid Contents of Human Bile, 394
Miles, Prof. John W. : The Potential Theory of Unsteady Supersonic Flow, *review* by L. E. Fraenkel, 505
Miles Laboratories, Inc. : To establish a basic research programme in England, 127
Milk : An Assessment of the Quantities of Fission Products likely to be found in, in the Event of Aerial Contamination of Agricultural Land (Dr. R. J Garner), 1063
  Removal of Strontium from (Dr. Leon Singer and Dr. W. D. Armstrong), 484

Milk from Cattle Inheritance of β-Globulins in Serum and (Bo Gahne, Jan Rendel and Dr Ole Venge), 907
Milk (Norwegian-produced) : Radiocaesium and Potassium-40 in (K. Madshus and J Baarli), 527
Milk (Spray-dried Danish) : Caesium-137 in (Per Gert Jensen), 562
Milk (Toronto), during 1959 : Caesium-137 in (Prof. K. G McNeill and O A D. Trojan), 399
Milk-ejecting Action of Ergot (Prof. Ranjit Roy Chaudhury and Mandakini B. Dikshit), 722
Milk Secretion in Goats : Influence of Cervical Sympathectomy and Pituitary Stalk Section upon (G. B Tverskoy), 782
Milk Testing (Dr. J. G. Davis), second edition, *review* by A L. Provan, 835
Milk and Agricultural Materials in the United Kingdom, 1958-59 : Strontium-90 in (Agricultural Research Council), 852
Mill (Hugh Robert) Medal and Prize for 1959 of the Royal Meteorological Society awarded to Dr B J Mason, 440
Miller, Dr. C. G. : Medical Research in the British Caribbean (Size of Liver in apparently Healthy Children), 863
Miller, D S (Fox, H C., and) : Ackee Toxin, a Riboflavin Antimetabolite ?, 561
Miller, E : Water Resources, *review*, 423
Miller, Jr., Franklin : A Student's Introduction to Physics, *review* by T. M. Yarwood, 68
Miller, Dr. John H. : Appointed instructor (developmental morphology) in the Department of Botany in Yale University, 1020
Miller, J. R. . Awarded a Ciba Fellowship for 1960-61, 684
Miller, L., and Carman, P. C. : Analogy to the Kirkendall Effect in the Gas Phase, 549
Miller, Dr. R E, and Wynne-Jones, Prof W. F. K. : Electron Transfer Reactions involving *s*-Trinitrobenzene, 149
Miller, W. J., and others : Bacterially Mediated False-Positive Reactions in Lytic Blood-Typing Tests, 247
Millidge, Dr. A. F. Industrial Chemistry of the Lower Olefines (Industrial Chemicals based on Ethylene and Propylene), 285
Millimetre Waves from Mercury Arc Harmonic Generator (Dr. K. D. Froome), 959
Mills, Dr C. F. : Minor Elements in Nutrition (Comparative Studies of Copper, Molybdenum and Sulphur Metabolism in the Ruminant and the Rat), 940
Mills, Prof. C Wright : The Sociological Imagination, *review* by E. Gellner, 504
Mills, J P *Obituary* by Prof. J. H Hutton, 1015
Milne, Lorus and Margery Paths Across the Earth, *review* by Sir Landsborough Thomson, 64
Milner, D R. Appointed Lucas Fellow in metal-joining in the Department of Industrial Metallurgy, University of Birmingham, 767
Milner, H B : Geology of Petroleum, *review*, 268
Milward, E S (edited by) Organization and Methods, a Service to Management, *review* by E. S. Hiscocks, 62
Mindanao Trough : A Sediment Core from the (H. Fredriksson), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 4), 609
  Mineralogical Composition of some <2 Micron Fractions in a Sediment Core from the (J. Ch L Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 5), 609
  A Note on the Foraminifera in a Sediment Core from the (R A Reyment), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 6), 609
  Fragments of Calcareous Algae in a Sediment Core from the (H Horn af Rantzein), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 7), 609
Mine-waters Iron Bacteria in (Dr. L G M Baas Becking and Dr. D Moore), 670
Mineral : A Regular Mixed-Layer Chlorite–Vermiculite (Dr. M. Nakahira and S Sugiura), 877
Mineral Paragenesis Russian Approach to, *review* by Dr. Bernard E Leake, 745
Mineralogical Composition of some <2 Micron Fractions in a Sediment Core from the Mindanao Trough (J Ch L Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No 5), 609
Mineralogical Periodicals : New, 683
Mineralogical Society, All-Union (East Siberian Division) : *Zapiski Vostochno-Sibirskogo, Otdeleniya Vsesoyuznogo Mineralogicheskogo Obshchestva*, Vol. 1, No. 1, 683
Mineralogical Society of India : *The Indian Mineralogist*, No 1, 683
Minéralogie et de Cristallographie, Société Française de Index of Crystallographic Supplies (edited by Dr A. J. Rose), second edition, 1019
Mineralogy in the U S S R (V F Alyavdin), 853
  Reference Books on (Academy of Sciences of the U S.S R.), 203
Minerals : Physiochemical Basis of the Analysis of the Paragenesis of (D. S. Korzhinskii), translated from the Russian, *review* by Dr Bernard E. Leake, 745
Mines The Measurement of Rock Pressure in (Nils Hast), 936
Miniature Gyroscopes : Use of, in Aircraft and Guided Missiles (W. R. Simons), 522
Mining Engineers, Institute of . Summer Meeting, 127
Mining and Metallurgy, Institute of : Gold Medals awarded to E D. McDermott and J. Kruttschnitt, 854
  Honorary membership conferred on the Rt Hon Lord Robins, Sir Patrick Linstead and George Augustus Whitworth, 854
Minnis, C. M : An Estimate of the Peak Sunspot Number in 1968, 462
Minnow : Distribution of Chromactivating Hormones in the Pituitary of the (A. K. Kent), 395
Minor Elements in Nutrition (Nutrition Society Symposium on), 939
Miocene Floras of the Columbia Plateau, Part 1, Composition and Interpretation (Ralph W. Chaney) ; Part 2, Systematic Considerations (Ralph W Chaney and Daniel I. Axelrod), *review* by Prof. J. Walton, 66
Mirza, R. : Acetylation of 4-Quinazolone, 716
Misra, Prof. A. P., and Haque, S. Q : Perfect Stage of *Sclerotium rolfsii* Sacc., 567
Missiles (Ballistic) : Development of, 358
Missile (Ballistic) Early Warning Station at Fylingdales Moor, 357
Missiles (Guided) : Use of Miniature Gyroscopes in Aircraft and (W. R. Simons), 522
Mistletoe in Australia (G. C. Greenham), 135
Misuse of a Statistical Test of Significance . Earthquakes and Uranus—(E J Burr), 336 , (Prof. R. Tomaschek), 337
Mitchell, J F (Krnjević, K., and) Release of Acetylcholine in Rat Diaphragm, 241
Mitchell, Dr. R L. : Minor Elements in Nutrition (Trace Elements in Scottish Soils), 939
Mitchell, Prof S A. : *Obituary* by Prof F. J M. Stratton, 200
Mite (Red Spider), *Tetranychus telarius* (L.) (Acarina : Tetranychidae) : Effect of Relative Humidity on Hatching and on Toxicity of Ovicides to Eggs of the (R A. Harrison and A. G. Smith), 409
Mitochondria Release of Methionine labelled with Sulphur-35 from Muscle Tissue and (Dr. R. Zák and Dr. Z. Drahota), 973
Mitochondria (Fresh and Aged Liver) : Swelling of, as affected by Succinate, Adenine Nucleotides and Thyroxine (Dr P. Emmelot, C. J. Bos, P. J. Brombacher and I. H. M. Reyers), 556
Mitochondria (Rat Liver) : Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of Isolated (C N. Graymore, A. H. Melhuish and A. L Greenbaum), 392
  Effects of Fatty Acids on the ^{32}P-Adenosine Triphosphate Exchange Reaction in (K Ahmed and Dr P. G Scholefield), 1046
Mitosis : Blocking of, by Heat Shock (Per Bergan), 905
Mitotic Non-disjunction A Mosaic of *Drosophila* consisting of 1X, 2X and 3X Tissue and its Probable Origin by (Prof. Curt Stern), 179
Mitra, M N, and others : Smilagenone and *Epi*-Smilagenin from *Dioscorea* Saponin, 236
Mitsui, - (Nagao, - , and) Factors affecting Tubers in *Begonia evansiana* Andr , 766
Mittal, L C, and others : Position of the Proximal Centriole in Flagellate Spermatozoa, 899
Mittal, T C (Mehra, Prof. P. N., and) : Indian Substitutes of Male Fern in Pharmacognosy, 722
'Mixed Layer' of the Atlantic Ocean : Strontium-90 in the (Dr. Vaughan T. Bowen and Prof. Thomas T. Sugihara), 71
Mixed-Layer Chlorite–Vermiculite Mineral : A Regular (Dr M. Nakahira and S Sugiura), 877
Mixers and Mortars (Laboratory Mechanical) : High-Pressure Phase Transformations in (Frank Dachille and Prof Rustum Roy), 34
Mixtures of Hard-Sphere Molecules A Monte Carlo Equation of State for (E. B Smith and K R Lea), 714
Mixtures of Permanent Gases Self-Quenching Geiger Counters containing (Dr. Oswald Riedel), 876 ; (A J. L Collinson, I. C Demetsopoullos, J. A. Dennis and J M Zarzycki), 876
Mixtures (Anaesthetic) : Analysis of, by Gas Chromatography (E. R. Adlard and D W. Hill), 1045
Mixtures (Haptoglobin) : Variations in Electrophoretic Position of, in Agar-gel Electrophoresis (Dr. Jan Hirschfeld), 894
Mixtures (Helium–Butane Gas), as Fillings for Geiger-Muller Tubes (Dr V. Moses and Dr J. F Fowler), 538
Mixtures (Volatile Mercaptan) . A Rapid Method for Qualitative Analysis of (John F. Carson, William J. Weston and Jack W. Ralls), 801
Model for Morphogenesis (Dr R. J. Goldacre and A D. Bean), 294
Model to account for the Production of Vibrationally Hot Molecules in Free-Radical Reactions (Dr. J. P. Simons), 551
Model (Muscle Fibre) : Effect of Electrical Stimulation on a, in the Presence of Adenosine Triphosphate (Prof Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Model-Making with 'Araldite' (E. J. R Thomas), 360
Modern Explosives (the late Dr. Wilfrid Taylor), 204
Modern Methods of Crystal Structure Determination (Manchester College of Science and Technology Summer School in), 766
Modern Philosophy of Science (Hans Reichenbach), translated and edited by Maria Reichenbach, *review* by Prof. Herbert Dingle, 503
Modern Science and the Human Fertility Problem (Dr. Richard L Meier), *review* by Dr Kenneth Walker, 188
Modern Trends in Enzymology, *review* by Prof. J Brachet, 267
Modes of Radiation-induced Cross-Linking in Hydrocarbon Polymers (T. F. Williams), 544
Modification for Washing the Benzidine Sulphate Precipitate in the Determination of Sulphate (Dr. I P T. Häkkinen), 232
Modification (Second Crystalline), in Polyethylene : Effect of a, on X-Ray Crystallinity Measurements (Dr. C. G. Vonk), 962
Modifier (Colour), in *Aspergillus nidulans* : 'Sage', a (B J Kilbey), 906
Modulators (Transistor), for Low-level Direct Current Signals (J. F. Evans), 626
Mohan, M. S (Patel, Dr. C C, and) Nature of the Colour-forming Species in Peroxy Titanium Sulphate, 803
Mohgaonkalan Cherts A New Specimen of *Nipa* Fruit from (Dr. S. D. Chitaley), 495
Mohler, Prof Hermann (herausgegeben von) . Chemische Reaktionen Ionisierender Strahlen (Radiation Chemistry), *review* by Prof. F. S. Dainton, 344
Mohres, Prof. F P Sensory Specialization in Response to Environmental Demands (Sonic Orientation of Bats and other Animals), 689
Moisture Effect of, on Carboxylic Acid Adsorption to Steel (M. E. Schrader and J L. Kalinsky), 710
Mole, R. H : An Introduction to Medical Genetics, *review*, 1003
Molecular Quadrupole Moment of Nitric Oxide (Dr. D. V. G L. Narasimha Rao), 881
Molecular Structure : Effect of, upon Concentration of Hydrocarbons in 'Painted' Mouse Skin (Mary Burnham and Fred G. Bock), 323
Molecule (Hydrogen) : Gaussian Wave Functions for the (J. V L Longstaff and Dr. K. Singer), 799
Molecules Electronic Structure of, *review* by Prof. C. A Coulson, 54
  Thermal Motion in Crystals and (International Union of Crystallography Symposium on), 1020
Molecules (Hard-Sphere) : A Monte Carlo Equation of State for Mixtures of (E. B Smith and K R. Lea), 714
Molecules (Macro-) required : Are, for Growth of Single Isolated Mammalian Cells ? (Ralph B. Gwatkin), 984
Molecules (*n*-Paraffin) : Ionization of (W. M Fairbairn), 151
Molecules (Stearic Acid), in Monolayers : Overturning of (George L. Gaines, jun.), 384

Molecules (Vibrationally Hot), in Free-Radical Reactions : A Model to account for the Production of (Dr J P. Simons), 551
Molekulphysik Die Methoden der, und ihre Anwendungsbereiche (Dr. H. Preuss), *review* by Prof. C. A. Coulson, 54
Mollison, Dr. P. L., and others : Role of C'_4 in the Antiglobulin Reaction, 482
Molluscan Oocytes : Golgi Bodies and Golgi Zones in (A. Bolognari), 565
Momose, Haruo, and Ikeda, Prof Yônosuke · Isolation of Mutants of *Bacillus subtilis* requiring D-Glutamic Acid, 567
  Physiology of D-Glutamic Acid-requiring Mutants of *Bacillus subtilis*, 818
Monkey . Foetal Haemoglobin in the (N. N. Sen, K. C Das and B. K. Aikat), 977
  Serotonin Content of the Pineal Glands of Man and (Prof. Nicholas J. Giarman, Daniel X Freedman and Luis Picard-Ami), 480
Monkey (Rhesus) : Development of Learning in the (Harry F. Harlow and colleagues), 211
  Diurnal Temperature Variation in the, under Normal and Experimental Conditions (Dr. Lloyd B Erikson), 83
Monkeys Cross-Modal Transfer of Training in (D. Burton and Dr. G Ettlinger), 1071
Monkeys and Disease, *review* by Dr. C. R. Coid, 506
Monoamine Oxidase · Inhibition of, by Benactyzine *in vitro* and *in vivo* (Dr. V. Vítek and K. Ryšánek), 244
Monoamine Oxidase Inhibitors Suppression of Increased Capillary Permeability in Injury by (W. G Spector and D. A Willoughby), 162
3-Monohydroxycholanic Acid : Cirrhosis of the Liver induced in Rabbits by Gastric Instillation of (Dr. Paul Holsti), 250
Monolayers : Overturning of Stearic Acid Molecules in (George L. Gaines, jun.), 384
  Polyvinyl Benzoate (Herman E. Ries, jun , Nicky Beredjick and Joseph Gabor), 883
Monolayers (Stearic Acid) : Orientation of, on Silver Single Crystals (Robert T. Mathieson), 301
Mononucleotide (Nicotinamide) Synthesis by Human Erythrocytes : Age Difference in (Dr. Vlastimil Habermann and Sona Habermannová), 389
5'-Monophosphates (Nucleoside) : Heterogeneous Labelling of Acid-soluble, during Short *in vivo* Incubation with Phosphate-^{32}P (Dr. T D. Price, K. K. Tsuboi, H. A Hinds and P B. Hudson), 158
Monoxenic Cultivation of an Enchytraeid Annelid (Dr. Ellsworth C. Dougherty and Bjørn Solberg), 1067
Monoxide (Carbon) Oxidation of Beryllium in Carbon Dioxide and in (Dr S. J. Gregg, Dr R. J. Hussey and Dr W B. Jepson), 468
Monoxide (Carbon), and in Carbon Dioxide Gas : Formation of Beryllium Carbide during the Corrosion of Beryllium in (V. D Scott), 466
Monte Carlo Equation of State for Mixtures of Hard-Sphere Molecules (E B Smith and K. R Lea), 714
Montgomery, Dr R. D. Medical Research in the British Caribbean, 862
Montmorillonite (Calcium–) Complexes of, with Polymers (W. W Emerson), 573
  Swelling of (Dr. A V. Blackmore and Prof. B P Warkentin), 823
Moody, M. F., and Parriss, J R. · The Visual System of *Octopus*—Discrimination of Polarized Light by *Octopus*, 839
Moon as a Radar Reflector · Roughness of the (V A Hughes), 873
Moore, Dr. D (Baas Becking, Dr. L. G. M , and) . Iron Bacteria in Minewaters, 670
Moore, R H , and others : Infra-red Spectra of Deuterium-labelled Carbohydrates, 307
Moore, Prof. S Elected a member of the United States National Academy of Sciences, 773
Moore, W C. · Progress in Plant Pathology, *review*, 47
Moran, Prof. P A P · The Theory of Storage, *review* by D G Kendall, 344
Moran, Dr T. : Research Association of British Flour Millers—New Laboratories, 856
Morant, Dr. M. J : Appointed lecturer in applied physics at the University of Durham, 937
Mordike, Dr. B L. : Awarded a Ciba Fellowship for 1960-61, 684
Morgan, H. D. · Fellowship of the City and Guilds of London Institute conferred on, 13
Morgan, Jeanne : The Morphology and Anatomy of American Species of the Genus *Psaronius*, *review* by Prof. John Walton, 190
Morowitz, H J , and others : A Connexion between S–S Bond Breakage and Inactivation by Radiation of a Dry Enzyme, 312
Morphine : Tolerance to Drugs, especially to (Dr. Guy Nadeau and Georges Sobolewski), 169
Morphine, Dihydrocodeine and Aminopyrine Analgesia · Synergetic Action of 2(o-Methoxyphenoxymethyl)-5-Oxazolidone on (Dr E. Fischer, J. L. J. Szabó and M Stamburgo), 893
Morphogenesis : A Model for (Dr R J Goldacre and A. D Bean), 294
Morphology (Nuclear), of Human Spermatozoa (Dr. Landrum B. Shettles), 648
Morphology and Anatomy of American Species of the Genus *Psaronius* (Jeanne Morgan), *review* by Prof. John Walton, 190
Morphy, D W : Fellowship of the City and Guilds of London Institute conferred on, 13
Morris, Clayton J , and others . (+) S-Methyl-L-Cysteine Sulphoxide, an Inhibitor of Aspartic Acid Utilization in *Leuconostoc mesenteroides*, 1051
Morrow, P F W , and others : A New Type of Autoxidation Reaction—Cause of the Instability of Cytochrome *c* Reductase, 1032
Morse, Dr Stephen I · Isolation of a Phagocytosis-Inhibiting Substance from Culture Filtrates of an Encapsulated *Staphylococcus aureus*, 102
Mortality (Accidental), of Guppies exposed to Elevated Temperature : Sex Difference in (Prof. John A. Freeman), 491
Mortality and Viability of Insect Migrants High in the Air (L. R. Taylor), 410
Mortars (Laboratory Mechanical Mixers and) High-Pressure Phase Transformations in (Frank Dachille and Prof Rustum Roy), 34
Morton, Prof F : Industrial Chemistry of the Lower Olefines, 285
Morton, Leslie T. : Given the Marcia C Noyes Award of the Medical Library Association of America, 685
Morton, Prof R. A., and others Dolichol, a Naturally Occurring Isoprenoid Alcohol, 470
Morton, R J., and others : The Growth in Weight and Tail Length of Inbred and Hybrid Mice reared at Two Different Temperatures, 446
Morton, Prof R. K., and others : A New Type of Autoxidation Reaction—Flavin Dissociation and Inactivation of Cytochrome b_2 by Oxygen, 1033
Mosaic of *Drosophila* consisting of 1X, 2X and 3X Tissue and its Probable Origin by Mitotic Non-disjunction (Prof. Curt Stern), 179
Mosaic (Micro-) Patterns in Single Crystals of Potassium Chloride containing Barium Chloride (J. Ewles and J. B. Dawson), 381
Mosaic Texture of Graphites (E G. Steward and B. P. Cook), 797
Mosaic Virus (Cauliflower) · Purification and Properties of (Prof Thomas P. Pirone, Glenn S. Pound and Robert J Shepherd), 656
Mosaic Virus (Tobacco) Decarboxylation of Glutamic Acid in Tobacco Leaves inoculated with (M. S. Gubanski), 657
  Primary Structure of the Protein of (F. A Anderer, H. Uhlig, E. Weber and Prof. G Schramm), 922
Mosaic Virus (Turnip Yellow) : Protein Components from (Dr. J. M. Kaper), 219
Mosaics (Photographic Emulsion) : Spectroscopic Applications of (Prof. R. W. Nicholls), 715
Moseman, Dr. A H : Appointed director for the agricultural sciences in the Rockefeller Foundation, 681 ; work of, 681
Mosen, A. W , and others : Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in Chondritic Meteorites, 863
Moses, Dr. V., and Fowler, Dr. J F. Helium–Butane Gas Mixtures as Fillings for Geiger-Muller Tubes, 538
Moss, H J , and others A Role for Thiol and Disulphide Groups in Determining the Rheological Properties of Dough made from Wheaten Flour, 451
Mostly about Museums (Dr. A E. Parr), *review* by Dr. F. S. Wallis, 110
Mota, Dr. I , and da Silva, W Dias : Antigen-induced Damage to Isolated Sensitized Mast Cells, 245
Motion of Artificial Satellites . Figures of Equilibrium of Celestial Bodies, with Emphasis on Problems of (Prof. Zdeněk Kopal), *review* by D. G. King-Hele, 747
Motion of Geomagnetic Field Lines (C. J. Loughnan), 33
Motion (Accelerated), in the Theory of Relativity : Analysis of (Robert T. Jones), 790
Motion (Thermal), in Crystals and Molecules (International Union of Crystallography Symposium on), 1020
Motions (Secular and Periodic), of the Node of an Artificial Earth Satellite (Prof Leon Blitzer), 874 , (D. G King-Hele), 875
Motivation (Prof Dalbir Bindra), *review* by Prof J Drever, 39
Moullin, Prof. E. B. . Retirement from the chair of electrical engineering in the University of Cambridge, 680 ; work of, 680
Moult and Handling Blood Glucose in Crayfishes in relation to (Dr J. A. Riegel), 727
Mount, Dr L. E , and Rowell, J G : Body-Weight and Age in relation to the Metabolic-Rate of the Young Pig, 1054
Mountains (Sor-Rondane), Queen Maud Land : Geological Reconnaissance of the (Prof E E. Picciotto), 740
Mourant, Dr. A. E., and others : The ABO Blood Groups, *review* by Dr. F. Stratton, 581
Mourkides, G. A , and others : Non-Enzymic Reactions of Indoles with Coenzyme I, 718
Mouse Influence of Route of Inoculation and Strain of, on Infectivity Titrations of the Virus of Foot-and-Mouth Disease (Wendy Heatley, H H. Skinner and H. Subak-Sharpe), 909
  Urinary Excretion of a Ninhydrin-positive Compound, probably a Peptide, after Administration of β-Aminoisobutyric Acid to the (Dr James B. Gilbert and Dr. Yuoh Ku), 160
Mouse (Infant) : Passage of Insulin through the Wall of the Gastrointestinal Tract of the (W A. Kelly), 971
Mouse (Young) · Selection of Iodinated Protein in the (W. A. Hemmings), 399
Mouse Encephalomyocarditis Virus Particles : Crystallization of Purified (P Faulkner, E. M. Martin, S Sved and Dr T. S. Work), 908
Mouse Parotid Tumours : Virus Release from Single Cells of (Dr Mathilde Krim and Dr. Leo Sachs), 262
Mouse Sarcoma 37 Cells Changes in the Deoxyribonucleic Acid Content of, following Serial Irradiation (Dr A. E. G. Pearson and N. B. Atkin), 647
Mouse Skin · Conjugation of 3:4-Benzpyrenols in (Dr. K. H Harper and Dr G Calcutt), 80
Mouse Skin ('Painted') : Effect of Molecular Structure upon Concentration of Hydrocarbons in (Mary Burnham and Fred G. Bock), 323
Mouse Tumour Blood Volumes Estimation of, employing a Radioactive Isotope Technique (F S. Stewart and Dr A. E. G. Pearson), 250
Move · How Animals (Sir James Gray), *review* by Dr. N. B. Marshall, 921
Movement (Arc) : Effect of Cathode Surface Roughness and Oxidation on (Dr. T. J. Lewis and Dr. P. E Secker), 30
Movement (Capillary), of Nitrate towards Tropical Soil Surfaces (R. Wetselaar), 572
Movements in the Foregut of *Schistocerca gregaria* Forsk. : Nervous Control of (Dr. K. U. Clarke and H. Grenville), 98
Movements of Scientific Men, 763
Movements (Roosting), of Starlings : Radar 'Ring Angels' and the (E. Eastwood, G A Isted and G. C. Rider), 112
Mucopolysaccharides of Serum and Pleural Fluid (Prof. C. W Fishel), 804
Mucoprotein (Salivary) · Correlation between Composition, Structure, Shape and Function of a (Dr. Alfred Gottschalk), 949
Mud Fauna of the Stour Estuary (Frances Bull, Helen Honeyman and Susan Knott), 1018
Mud Surfaces (Sprayed) : Determination of Dieldrin Deposits on (Dr. R. E. Ford), 994
Mukherjee, Dr. Bibhuti · Uraninite and Thorianite, 464
Mukherjee, Dr J N. : Elected president for 1960 of the Agricultural Society of India, 937
Muller, C J. · Separation of the α- and β-Chains of Globins by means of Starch-gel Electrophoresis, 643
Muller, H K , and others (edited by) : Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
Mullins, B P : Explosions, Detonations, Flammability and Ignition, Part 2, *review* by Dr H. F. Coward, 666
Mullite Problem : A New Interpretation of the (J. H Welch), 545
Multiple Infections of Trematodes in a Snail (Wm. H Ewers), 990

Multiple Spot Formation by Pure Substances · Paper Chromatography—(Dr. A. H. Beckett, M. A. Beaven and Dr. Ann E. Robinson), 775
Mundaring Geophysical Observatory, 606
Munro, Dr. H. N., and others : Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by Protein Administration, 719
Murai, Kyoko (Matsunaga, Prof. E., and) : Haptoglobin Types in a Japanese Population, 320
Murgatroyd, Dr. R. J. · Awarded the Buchan Prize for 1955-59 of the Royal Meteorological Society, 440
Muroya, Tomizo, and others : Effect of Electrical Stimulation on a Muscle Fibre Model in the Presence of Adenosine Triphosphate, 318
Murray, K., and others : Behaviour of some Aldehydes on a Sulphonated Polystyrene Resin, 469
Murray, R. K., and Connell, G. E. Elevation of Serum Haptoglobin in Rabbits in Response to Experimental Inflammation, 86
Murray, Prof. Raymond L. : Nuclear Reactor Physics, *review* by J. Fell, 68
Murrell, K. F. H. : Appointed a Research Fellow in the Department of Psychology in the University of Bristol, 937
Musca domestica (Adult Housefly) : Mechanisms of Resistance of the, to 'Cyclodiene' Insecticides (Dr. G. T. Brooks), 96
Muscle (Depolarized Smooth) : Calcium and Contractility in (Dr. P. A. Robertson), 316
Muscle (Rat), *in vitro* : Effect of Denervation on Potassium-42 Uptake by the (Dr. Z. Drahota and O. Hudlická), 396
Muscle (Smooth) : Membrane Potential Changes associated with Stimulation of, by Adrenalin (G. Burnstock), 727
Muscle during Activity : Determination of Small Rapid Volume Changes in a (Prof B. C. Abbott and R. J. Baskin), 1055
Muscle Fibre Model in the Presence of Adenosine Triphosphate : Effect of Electrical Stimulation on a (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Muscle Receptors in the Kitten : Activity of (Dr. Sten Skoglund), 478
Muscle Tissue and Mitochondria · Release of Methionine labelled with Sulphur-35 from (Dr. R. Zák and Dr. Z. Drahota), 973
Muscles (Injured and Regenerating) : Treatment of, with Plant Extracts (S. Hoja and J. Vrttek), 283
Muscular (Neuro-) Transmission in the Earthworm (Dr. G. A. Horridge and Dr. M. B. V. Roberts), 650
Museum of Applied Arts and Sciences, Sydney : Annual Report for 1958, 683
Museum (Australian) : Exhibit entitled 'These are Invertebrates', 438
Museum (Bernice P. Bishop), and others : Tenth Pacific Science Congress of the Pacific Science Association, 604
Museum (Manchester) : Annual Report for 1958-59, 521
Museum (National), of Canada : Natural History Paper No. 3, *Anchiceratops* from the Oldman Formation of Alberta (Wann Langston), 522
Bulletin No. 160, Contributions to Botany, 1017
Bulletin No. 162, Contributions to Anthropology, 1017
Bulletin No. 166, Contributions to Zoology, 1017
Museum (National), of Wales : Annual Report (1958-59), 15
Museum (National Maritime), Greenwich : Appointment of Lieut.-Comdr. D. W. Waters as curator of navigation and astronomy, 12
Museum (Transvaal) : *Bulletin* of the, No. 4, 936
Annals of the, Vol. 14, Part 1, 936
Museum and Art Gallery, Durban : Annual Report for 1958-59, 203
Museums : Mostly about (Dr. A. E. Parr), *review* by Dr. F. S. Wallis, 110
The Philosophy of, *review* by Dr. F. S. Wallis, 110
Mustafa, Prof. Ahmed, and others : Antipyretic Action of 1-Phenyl-3,5-pyrazolidinedione, 165
Mutants of *Bacillus subtilis* requiring D-Glutamic Acid : Isolation of (Haruo Momose and Prof Yônosuke Ikeda), 567
Mutants (D-Glutamic Acid-requiring), of *Bacillus subtilis* : Physiology of (Haruo Momose and Prof. Yônosuke Ikeda), 818
c-Mutations : Induction and Reversion of, by Irradiation of the Extracellular χ-Phage of *Serratia* (Prof. R. W. Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
Mycobacteria : Mycosides, a New Class of Type-Specific Glycolipids of (Donald W. Smith, H. M. Randall, A P. MacLennan and E Lederer), 887
Mycological Conference : Sixth Commonwealth (Commonwealth Mycological Institute), 361, 523
Mycological Institute (Commonwealth) · Sixth Commonwealth Mycological Conference, 361, 523
Mycological Society (British) : Applications invited from members, and heads of departments, for grants from the Cheesman and Pethybridge funds to enable students of mycology to attend the Spring or Autumn Foray, or the Plant Pathology Field Meeting, 440
Presidential Address, Research into Griseofulvin (Dr. P W. Brian), 853
Mycological Society, British (Association of Applied Biologists and the) : Symposium on the Nature and Exploitation of Crop Plant Resistance to Disease, 857
Mycology (Commonwealth Mycological Institute Commonwealth Conference on), 361, 523
Mycorrhiza, *review* by Dr. J. Warren Wilson, 48
The Biology of (Dr. J. L. Harley), *review* by Dr. J. Warren Wilson, 48
Mycosides, a New Class of Type-Specific Glycolipids of *Mycobacteria* (Donald W. Smith, H. M. Randall, A. P. MacLennan and E. Lederer), 887
Myelin Sheath (Peripheral Nerve Fibre) : Neurokeratin Network of the, as a Centre of Metabolic Activity (Dr. H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Myelinated, Isolated Nerve Fibres of the Frog : Effect of Curare on Conduction in (Dr Wolf D. Dettbarn), 891
Myers, J. (Biswas, Dr. B. B., and) : A Methyl Cytidine from the Ribonucleic Acid of *Anacystis nidulans*, 238
Myklestad, H., and others . Vitamin A Isomers in the Liver of Rats and Chicks, 312
Myoglobin from *Thunnus thynnus* · Oxygen Equilibrium of (Prof. A. Rossi-Fanelli, E. Antonini and R. Giuffrè), 896
Myosin-5'-Nucleotidase : Activity in relation to *p*H of (Darcy Gilmour), 295

NADEAU, Dr. Guy, and Sobolewski, Georges : Tolerance to Drugs, especially to Morphine, 169
Näf, Ulrich, and others : Purification of a Specific Inducer of the Male Sex Organ in certain Fern Species, 1066
Nagao, —., and Mitsui, —. : Factors affecting Tubers in *Begonia evansiana* Andr., 766
Nagao, —. (Esashi, —., and) : Factors affecting Tubers in *Begonia evansiana* Andr , 766
Nagata, Yutaka, and others : Active Transport of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates, 474
Nagatsu, Ikuko, and others : Condensation Product of Ethylenediamine with Noradrenaline or 3,4-Dihydroxymandelic Acid, 310
Nagatsu, Toshiharu, and others : Condensation Product of Ethylenediamine with Noradrenaline or 3,4-Dihydroxymandelic Acid, 310
Nagel, Ernest, and Newman, James R. : Godel's Proof, *review* by F. I. G. Rawlins, 61
Nagle, D. E., and others : Ultra-High Resolution γ-Ray Resonance in Zinc-67, 707
Naha, Pritindra Mohan · Nuclear Phenomena in *Trametes cingulata* Berk., 903
Nair, M. K. C : Recent Advances in Coconut Research in India, 861
Nair, R. Gopinathan : Recent Advances in Coconut Research in India, 861
Nair, U. K., and Radha, Dr. K. : Recent Advances in Coconut Research in India, 861
Nakahira, Dr. M., and Sugiura, S. : A Regular Mixed-Layer Chlorite—Vermiculite Mineral, 877
Nakamura, S , and others : Measurement of the Intrahepatic Shunted Flow of Blood in Cirrhosis of the Liver, 243
Nakamura, T., and others : Measurement of the Intrahepatic Shunted Flow of Blood in Cirrhosis of the Liver, 243
Nakič, Dr. B., and others : Graft versus Host Reaction in Parabiotic Disease, 322
Nakič, Z., and others · Graft versus Host Reaction in Parabiotic Disease, 322
Nambiar, C. K. Balakrishnan : Recent Advances in Coconut Research in India, 861
Nambiar, M. C. : Recent Advances in Coconut Research in India, 861
N-1-Naphthyl Phthalamic Acid : A Comparison of Adhering and Abscising Fruits of Peach treated with (Prof. Loyd E. Powell and Charlotte Pratt), 814
Narasimha Rao, Dr. D. V. G. L. : Molecular Quadrupole Moment of Nitric Oxide, 881
Narcotic Drugs : International Control of, 21
Narrow Tubes , Flow of Blood through (Dr. G. W. Scott Blair), 708
Nath, P. R. : Recent Advances in Coconut Research in India, 861
Nath, Prof. Vishwa, and others · Position of the Proximal Centriole in Flagellate Spermatozoa, 899
Nation, J. A., and others : Growth of Surface Instabilities in a Linear Pinched Discharge, 624
National Academy of Sciences (United States) : Biographical Memoirs of the, Vol. 33, *review*, 70
J. Lawrence Smith Medal awarded to Dr. E. J. Öpik, 280, 686 ; *erratum*, 361
James Craig Watson Medal awarded to Prof. Yusuke Hagihara, 686
Agassiz Medal awarded to Dr. Anton Frederick Bruun, 686
Kimber Genetics Award awarded to Prof George Wells Beadle, 686
Public Welfare Medal awarded to Dr. Alan T. Waterman, 686
Election of Dr. Lloyd V. Berkner as treasurer, 773
Election of Prof. G. Evelyn Hutchinson and Dr. Robley C. Williams as members of the Council, 773
Election of new Members, 773
National Academy of Science, United States (National Research Council) : The Radiochemistry of Cadmium (James R. DeVoe), 602
The Radiochemistry of Arsenic (Harold C Beard), 602
The Radiochemistry of Francium (Earl K. Hyde), 602
National Academy of Sciences (United States), and others : Tenth Pacific Science Congress of the Pacific Science Association, 604
National Aeronautics and Space Administration (United States) : Grant of 216,000 dollars to the University of Maryland, to accelerate its programme on basic research dealing with the growth and metabolism of unicellular algae, 604
National Bureau of Standards (United States) : Monograph No 5, Preservation of Documents (W. K. Wilson and B. W. Forshee), 124
National Certificates (Higher), and Professional Status, 123
National Coal Board · Grant of £1,600 to the University of Oxford, for the continuation of research on hot and humid conditions, being carried out in the Department of Human Anatomy, 126
National Council for Technological Awards : Honorary diploma in technology (engineering) awarded to Lord Hives, 767
National Institute of Adult Education : Residential Short Courses, 685
National Institute of Agricultural Botany . Thirty-ninth Report (1958), 287
National Institute of Economic and Social Research : Economic and Social Studies, Vol. 18, British Industrialists—Steel and Hosiery, 1850-1950 (Charlotte Erickson), *review* by R. Brightman, 347
National Institute of Genetics, Japan : Annual Report No. 9 (1958), 286
National Institute of Industrial Psychology : Vernon Prize for 1960 awarded to Dr. R. B. Buzzard, 938
National Institute for Research in Nuclear Science : Grant of £10,450 to the University of Oxford for an investigation of the alignment of nuclei for the proton linear accelerator, to be carried out in the Clarendon Laboratory, 126
National Maritime Museum, Greenwich : Appointment of Lieut.-Comdr. D. W. Waters as curator of navigation and astronomy, 12
National Museum of Canada . Natural History Paper No. 3, *Anchiceratops* from the Oldman Formation of Alberta (Wann Langston), 522
Bulletin No. 160, Contributions to Botany, 1017
Bulletin No. 162, Contributions to Anthropology, 1017
Bulletin No. 166, Contributions to Zoology, 1017
National Museum of Wales : Annual Report (1958-59), 15
National Park : The Serengeti (Dr. A. S Thomas), 605
National Parks : Britain's (edited by Harold M. Abrahams), *review*, 70
National Parks Commission . Annual Report (1958-59), 281
National Physical Laboratory Name of the Control Mechanisms and Electronics Division to be changed to the Autonomics Division, 440
Open Days, 523

National Reference Library of Science and Invention, 934
National Research Corporation (United States) Appointment of Dr. Milo P. Hnilicka as scientific assistant to the vice-president and director of research, 604
National Research Council of Canada : Appointment of Ralph E. McBurney as head of the Technical Information Service, 17
  Review (1959), 124
  Scholarships for 1960-61, 854
National Research Council, United States (National Academy of Sciences) : The Radiochemistry of Cadmium (James R. DeVoe), 602
  The Radiochemistry of Arsenic (Harold C. Beard), 602
  The Radiochemistry of Francium (Earl K. Hyde), 602
National Research Development Corporation of India : Fifth Annual Report (1958-59), 202
National Science Foundation (United States) : Projects in Colleges and Universities on the Economic and other Impacts of Scientific Research and Development, 14
  Bibliography on the Economic and Social Implications of Scientific Research and Development, 14
  Ninth Annual Report (1958-59), 362
  Title of *Science Information News* to be changed to *Scientific Information Notes*, 437
  Award of Graduate Fellowships for 1960-61, 684
  Science and Engineering in American Industry—Report of a 1956 Survey, 763
  Report on Research and Development in Colleges and Universities in the Fiscal Year 1958, 1016
National Science Foundation, United States (Organization for European Economic Co-operation and the) . Award of Senior Visiting Fellowships in Science, 1019
National Union of Students : Memorandum to the University Grants Committee on the Expansion of University Education (1960-1970), 687
National Union of Teachers · University Entrance—the Basic Facts, 14
Native Protein and Inorganic Salts · Specific Interaction of (Folke Rønnike), 88
NATO · Grant from the Research Grants Advisory Panel of £25,000 to the Department of Physics, University of Bristol, for the support of an International expedition to the central Mediterranean, 284
NATO (Advisory Group for Aeronautical Research and Development) : AGARDograph No. 31, Explosions, Detonations, Flammability and Ignition, Part 1 (Prof. S. S. Penner) ; Part 2 (B. P. Mullins), *review* by Dr. H. F. Coward, 666
  Meeting on Ionospheric Research, 685
  Discussion on Boundary Layer Research, 1022
Natural Bradykinin · Bradykinin Activity of some Synthetic Peptides with only Slight Structural Resemblance to (Dr. G. L. Tritsch and Prof D. W. Woolley), 76
Natural History Societies · School, 282
Natural History Survey (Illinois) : Bulletin, Vol. 27, Article 4, Food Habits of Migratory Ducks (Harry G. Anderson), 17
Natural Radioactivity (Long-lived) : Use of, as an Atmospheric Tracer (W M. Burton and N. G. Stewart), 584
Natural Remanent Magnetization of some Welsh Slates : Anisotropy of Susceptibility and the (M. D. Fuller), 791
Natural Resources, International Union for Conservation of Nature and : Seventh General Assembly, jointly with the eighth Technical Meeting, 206
Natural Rubber Research (Rubber Research Institute of Malaya, the Government of the Federation of Malaya and the Rubber Producers' Council International Conference on), 767
Natural Sciences : A Quarter Century in the (Dr. Warren Weaver), 20
Naturalists Society (Suffolk) : Transactions, Vol. 1, Part 3, Mud Fauna of the Stour Estuary (Frances Bull, Helen Honeyman and Susan Knott), 1018
Naturally Occurring Isoprenoid Alcohol : Dolichol, a (J. F. Pennock, F. W. Hemming and Prof R A Morton), 470
Nature of the Colour-forming Species in Peroxy Titanium Sulphate (Dr. C. C. Patel and M. S. Mohan), 803
Nature of Cupric Alkanoate Solutions (Dr. D. P. Graddon), 715
Nature (Dual), of the Third Component of Complement : Further Evidence for the (Dr. J. D. Hawkins), 483
Nature Conservancy : Annual Report (1958-59), 128
  Strathy Bog Nature Reserve, 358
  Additions to the Rannoch Moor Nature Reserve, 358
Nature Conservation in Africa, 935
Nature Reserve (New), in Scotland, 358
Nature and Exploitation of Crop Plant Resistance to Disease (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Nature and Natural Resources, International Union for Conservation of · Seventh General Assembly, jointly with the eighth Technical Meeting, 206
Naudé, Dr. S. M. . Elected president for 1960 of the Royal Society of South Africa, 766
Nectria haematococca Berk. and Br . Is, the Perfect Stage of *Fusarium oxysporum* Schl. forma *pisi* (Lindf.) S. and H. ? (W. L. Gordon), 903
Needham, Dr. A. E. : Arrow Symbol in Biology, 103
Needham, Dr. Joseph, with the collaboration of Dr Wang Ling · Science and Civilization in China, Vol. 3, Mathematics and the Sciences of the Heavens and the Earth, *review* by Prof. W. M. Smart, 36
Needham, Dr. Joseph, and others : Heavenly Clockwork—the Great Astronomical Clocks of Medieval China, *review* by Dr F A. B. Ward, 834
Needs of University Students, 687
Negative Ions formed by Charge Transfer · Detection of (T. M. Donahue and F. Hushfar), 1038
Neghme, A., and others : Non-Identity of Triosephosphate Dehydrogenase of Adult Male and Nymph Development Stages of *Triatoma infestans*, 1052
Nelken, Dr D , and others · Blood Groups in Rabbits, 321
Nelson, C. D , and others : Evidence of Concurrent Translocation, 205
Nelson, Dr. S. M. : Appointed lecturer in organic chemistry at the Queen's University, Belfast, 767
Nematodes (Root-Knot), *Meloidogyne* spp. : Plants Recorded as Resistant to (Mary T. Franklin and D. J. Hooper), 684
Nematology at the Imperial College of Science and Technology, London, 205
Neolithic Revolution : The (Sonia Cole), 360
Neoplastic Growth (Primary) : Chromosomes in (Dr. K. Bayreuther), 6
Nerve Fibre Myelin Sheath (Peripheral) : Neurokeratin Network of the, as a Centre of Metabolic Activity (Dr. H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Nerve Fibres (Myelinated, Isolated), of the Frog : Effect of Curare on Conduction in (Dr Wolf D. Dettbarn), 891
Nervous Activity (Higher) Pavlov Journal of (translated from the Russian), 935
Nervous Control of Movements in the Foregut of *Schistocerca gregaria* Forsk. (Dr. K. U. Clarke and H. Grenville), 98
Nervous System (Central) : 'Weightless' Micro-electrodes for Recording Extra-cellular Unit Action Potentials from the (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Net Electric Charges on Stars : Existence of (Prof. V. A. Bailey), 508
Netter, Prof. Hans : Elected a member of the Medicine Section of the Leopoldina Academy of Natural Sciences, 766
Network (Neurokeratin), of the Peripheral Nerve Fibre Myelin Sheath as a Centre of Metabolic Activity (Dr. H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Neuberger, Prof. A. (Marshall, Dr. R. D., and) · Amide Nitrogen Content of Ovomucoid, 311
Neurokeratin Network of the Peripheral Nerve Fibre Myelin Sheath as a Centre of Metabolic Activity (Dr. H. B. Tewari and Prof. Geoffrey H. Bourne), 645
Neurologists's View : Brain—Memory—Learning—a (Dr. W. Ritchie Russell), *review* by Dr. Gilbert Hall, 39
Neuromuscular Junctions (Crayfish) : Spontaneous Potential Changes at (Dr. Josef Dudel and Richard K Orkand), 476
Neuro-Muscular Transmission in the Earthworm (Dr. G. A. Horridge and Dr. M. B. V. Roberts), 650
Neurons (Ageing), of some Teleosts : Cytoplasmic Inclusions of the (Prof. A Stolk), 332
Neurosecretory System of Larval Lampreys (*Petromyzon marinus*) : Responsiveness of the, to Light (Dr. Nezihe Oztan and Dr Aubrey Gorbman), 167
Neuroses Cardiac, *review* by Dr. D. C. Deuchar, 423
Neuroses (Cardiac) : The Chemical Prevention of (Prof. Hans Selye), *review* by Dr. D. C. Deuchar, 423
Neutron : Comparison of the Charges of the Electron, Proton and (A. M. Hillas and T. E. Cranshaw), 459
Neutron Physics, *review* by Dr. P. A. Egelstaff, 187
  Introduction to (Dr. L F. Curtiss), *review* by Dr. P. A. Egelstaff, 187
New to the Old World : *Stereobalanus*, a Genus (C. Burdon-Jones and A. D. McIntyre), 491
New Allele in the Kidd Blood Group System : Evidence for a, in Indians of Northern Mato Grosso, Brazil (Dr. Richard T. Silver, Jane M. Haber and Dr. Aaron Kellner), 481
New Ammonia Plant to be built at Severnside (Imperial Chemical Industries, Ltd.), 202
New Antibacterial Sulphonamide . Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methyl*iso*thiazole), a (A. Adams, W. A. Freeman, A. Holland, D. Hossack, J. Inglis, J. Parkinson, H. W. Reading, K. Rivett, R. Slack, R. Sutherland and R. Wren), 221
New Biology Building of the University College of Wales, Aberystwyth (Prof. T. A. Stephenson and Prof. P. F. Wareing), 1021
New British Computer, 201
New British Transistorized Computer (General Electric Co , and International Computers and Tabulators, Ltd.), 936
New Class of Hormonally Active Steroids (Dr. E. H. Reerink, H. F. L. Scholer, P. Westerhof, A. Querido, A. A. H. Kassenaar, E Diczfalusy and K. C. Tillinger), 158
New Class of Type-Specific Glycolipids of *Mycobacteria* : Mycosides, a (Donald W. Smith, H M. Randall, A. P. MacLennan and E. Lederer), 887
New Clathrate Compounds of the Inert Gases (J. G. Waller), 429
New Complexes of Rhenium : Some (R. Colton, R. Levitus and Prof. G. Wilkinson), 233
New Copper Protein from *Chlorella ellipsoidea* (Dr. Sakae Katoh), 533
New Cosmography : The, *review* by Dr. D. W Dewhirst, 109
New Electrophoretic Medium and its Application to the Resolution of Human Haemoglobin Variants (Dr. E. R. Huehns and Dr. A. O. Jakubovic), 729
New Herbicide : 2,6-Dichlorobenzonitrile, a (Dr. H Koopman and J. Daams), 89
New Instruments for Electronic Engineers, 852
New Interpretation of the Mullite Problem (J. H Welch), 545
New Laboratories at the University of Liverpool, 844
New Method in the Theory of Superconductivity (N. N. Bogoliubov, V. V. Tolmachev and D. V. Shirkov), translated from the Russian, *review* by Dr. C. G. Kuper, 833
New Mineralogical Periodicals, 683
New Nature Reserve in Scotland, 358
New Olduvai Australopithecine : The Affinities of the (Dr. J. T. Robinson), 456 ; (Dr. L. S. B Leakey), 458
New Predissociation in Nitrogen (Alf Lofthus), 302
New Psychotomimetic Agent : Blocking Effect of Tetrahydroaminacrin on a (Dr. Samuel Gershon), 1072
New Purine Riboside Isolated from *Fusarium* Species : Characterization of a (Dr Alessandro Ballio, Dr Carlo Delfini and Dr. Serena Russi), 968
New Record Low Sea-Level Air Pressure (C. L. Jordan), 283
New Scientific Journals : Rapid Increase in the number of (Scientific Publications Council Discussion on), 18
New Specimen of *Nipa* Fruit from Mohgaonkalan Cherts (Dr. S D. Chitaley), 495
New States : Science in the Advancement of (Weizmann Institute of Science International Conference on), 604
New Technique for Studying the Quantitative Aspects of Cytochemical Reactions and its Application to the Feulgen Reaction (P. van Duijn and J. -P. Persijn), 805
New Type of Autoxidation Reaction—Cause of the Instability of Cytochrome c Reductase (Dr Malcolm Dixon, J. M. Maynard and P. F. W. Morrow), 1032 ; Flavin Dissociation and Inactivation of Cytochrome b_2 by Oxygen (J. McD Armstrong, Dr. J. H. Coates and Prof R. K. Morton), 1033

New Weight Standards for Men and Women (Metropolitan Life Insurance Co Ltd , New York, Bulletin, Vol. 40), 445
New York Academy of Sciences · Symposium on Cardiovascular Effects of Nicotine and of Smoking, 525
  Conference on the Actinomycins and their Importance in the Treatment of Tumours in Animals and Man, 771
New Zealand : An Association between Dental Caries and certain Soil Conditions in (T. G Lugwig, W. B Healy and Capt. F. L Losee), 695
  A Red Water Bloom of Rotifers in Cook Strait (Vivienne Cassie), 328
  The Redpoll in—Interbreeding Sub-species (David Stenhouse), 488
New Zealand Antarctic Expedition (Sir Edmund Hillary), 526
New Zealand Department of Scientific and Industrial Research : Report for 1958-59, 129
Newell, jun , Homer E : Sounding Rockets, *review* by W H Stephens, 269
Newitt, Prof D. M Fellowship of the City and Guilds of London Institute, *honoris causa*, conferred on, 13
Newman, E L. (Aldrich, Dr B I., and) : Visco-Elastic Systems (Couette Viscometer designed for Testing Syrup), 943
Newman, J. A. S (Kallmes, O , and) : Structure of the Outer Secondary Wall on Unbleached Spruce Sulphite Fibres, 566
Newman, James R. (Nagel, Ernest, and) : Godel's Proof, *review* by F. I. G Rawlins, 61
Newstead, Prof Gordon, and Watt, P A. · A Telemetered Seismic Net In Tasmania, 704
Newton, Dr. B. A. Organization, Control and Synthesis in Micro-organisms, *review*, 49
  Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds (The Mechanism of the Bacterial Action of Synthetic Surface-Active Compounds), 132
Niacin : A Micromethod for Testing for (E Medveczky), 332
Nicholas, Dr. D. J. D , and Fisher, D. J. : Nitrogen Fixation in Extracts of *Azotobacter vinelandii*, 735
Nicholls, Prof R W. . Spectroscopic Applications of Photographic Emulsion Mosaic, 715
  Interpretation of Intensity Distributions in the N_2 Lyman–Birge–Hopfield and CO Fourth Positive Band Systems, 958
Nicholson, D. E. · Infra-Red Spectra of Ammonia adsorbed on Silica–Alumina Catalysts, 630
Nickel Plating : Brighteners for, and Polarographic Maxima (Hideya Okada and Takeo Ishida), 152
Nicol, Dr Davidson · Appointed principal of Fourah Bay College (University College of Sierra Leone), 599 ; work of, 599
Nicol, Prof T. (Ware, C C., and) Duration of Stimulation of Phagocytic Activity of the Reticulo-Endothelial System after Cessation of Treatment with Diethylstilboestrol, 974
Nicotinamide Mononucleotide Synthesis by Human Erythrocytes : Age Difference in (Dr Vlastimil Habermann and Sona Habermannová), 389
Nicotine · Cardiovascular Effects of, and of Smoking (New York Academy of Sciences Symposium on), 525
Nicotinic Acid in Man : Interrelation of Tryptophan and, during the First Month of Life (S Auricchio, E Quagliariello and A. Rubino), 639
Nicotinic Acid and Nicotinic Acid Adenine Dinucleotide : Excretion of, by Biotin–deficient Yeast (Dr Anthony H Rose), 139
Nicotinic Acid Adenine Dinucleotide · Excretion of Nicotinic Acid and, by Biotin–deficient Yeast (Dr. Anthony H Rose), 139
Nidifugous Birds A Positive Fundamental in the Behaviour of Young (Dr. Peter M. Driver), 416
Niewiarowski, Dr. S. (Steinbuch, Dr. M., and) : Rivanol in the Preparation of Plasminogen (Profibrinolysin), 87
Nigeria : Grooved Rocks at Apoje (William Fagg), 205
Nigerian Children · Sickle-Cell Anaemia in (R. G. Hendrickse), 1027
Nigerian Plants · The Photoperiodic Response of some (E. Njoku), 438
Night Sky in May, 284 ; in June, 604 ; in July, 938
Nineteenth-Century Botanist, *review* by Sir Edward Salisbury, 44
Ninhydrin-positive Compound, probably a Peptide : Urinary Excretion of a, after Administration of β-Aminoisobutyric Acid to the Mouse (Dr. James B. Gilbert and Dr. Yuoh Ku), 160
Nipa Fruit : A New Specimen of, from Mohgaonkalan Cherts (Dr S. D. Chitaley), 495
Nirk, Helgi Interspecific Hybrids of *Lycopersicum*, 1071
Nissan, Prof A. H (edited by) . Textile Engineering Processes, *review* by Prof C. S Whewell, 189
Nitrate Capillary Movement of, towards Tropical Soil Surfaces (R. Wetselaar), 572
Nitrate Electrode A Reversible (P. H T Beckett), 879
Nitric Oxide Effect of Oxygen and, on the Radiosensitivity of Human Cells in Tissue Culture (Dr D. L. Dewey), 780
  Molecular Quadrupole Moment of (Dr. D V G. L. Narasimha Rao), 881
Nitrocellulose (Silver-activated), as Recording Material for X-Ray Microscopy (Saara K Asunmaa), 1036
Nitrogen : A New Predissociation in (Alf Lofthus), 302
Nitrogen in Tropical Agriculture (Australian Commonwealth Scientific and Industrial Research Organization Symposium on), 941
Nitrogen (Active) : Reaction of, with Polyethylene (Dr. J. L. Weininger), 546
Nitrogen (Liver), in Mice : Thyroid-Powder Feeding and (Dr. A. N. Granitsas, M Kukku and M. Konstantinidu), 890
Nitrogen Fixation in Extracts of *Azotobacter vinelandii* (Dr. D. J. D Nicholas and D J Fisher), 735
Nitrogen Fixation by a Legume · Cobalt in (Prof. H M Reisenauer), 375
N_2 Lyman–Birge–Hopfield and CO Fourth Positive Band Systems . Interpretation of Intensity Distributions in the (Prof. R. W. Nicholls), 958
Nitrogen (Amide) Content of Ovomucoid (Dr R D. Marshall and Prof A. Neuberger), 311
Nitrogenous Compounds · Use of Ionizing Radiation In Spot Tests for (H. J. M. Bowen, E Arter and P. A Cawse), 383
Nitrous Acid : Application of Pyramidone to Detection of (Prof. Wiktor Wawrzyczek), 883
Nitrous Oxide . Use of, to discriminate between the Forms of Hydrogen Atoms (H· and H_2^+ ?) produced by γ-Irradiation of Aqueous Solutions (Prof F. S. Dainton and Dr. D. B. Peterson), 878
  Use of, to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide Irradiated with Ultra-violet Light (Prof. F. S. Dainton and S. A. Sills), 879
Njaa, L. R., and others : Vitamin A Isomers in the Liver of Rats and Chicks, 312
Njoku, E The Photoperiodic Response of some Nigerian Plants, 438
Noades, Jean, and others : An Rh Antibody Specific for V and R's, 171
  M_1, a Subdivision of the Human Blood Group Antigen M, 642
Noakes, G R. · From Nucleus to Universe, *review*, 748
Nobel Prizes Tenth Annual Meeting of Holders of, 938
Node of an Artificial Earth Satellite Secular and Periodic Motions of the (Prof Leon Blitzer), 874 ; (D G King-Hele), 875
Nodulation Patterns on Legumes (R T Lange and C. A. Parker), 178
Nodules (Root), of *Casuarina cunninghamiana* : Haemoglobin In the (Dr. H E. Davenport), 653
Noise, Committee on the Problem of : Ready to receive evidence, 1020
Noise (Atmospheric Radio) : Observations of (G R A Ellis), 229
Noise (Cosmic) : A Relation between Solar Radio Emission and Solar Cap Absorption of (Dr. M. R. Kundu and Prof F. T Haddock), 610
Noise Control · Acoustic Tiles for, 602
Noltingk, Dr. B E. : The Human Element in Research Management, *review* by E. S Hiscocks, 579
Nomenclature · Chemical, *review* by Prof H. J Barber, 54
  Geological (English–Dutch–French–German), (edited by A. A. G. Schieferdecker), *review* by Dr V. A. Eyles, 57
Nomenclature (Chemical) . An Introduction to (Dr. R. S Cahn), *review* by Prof H. J. Barber, 54
Non-cytocidal Strains of Rabies Virus An Indicator Plaque-forming System for Demonstration of Interference by (Dr. Martin M. Kaplan, Dr. Eberhard Wecker, Dr Zlatko Forsek and Dr Hilary Koprowski), 821
Non-destructive Testing of Metals · Physical and Structural Aspects of (Non-destructive Testing Group of the Institute of Metals and the Société Française de Métallurgie Conference on), 284
Non-disjunction (Mitotic) A Mosaic of *Drosophila* consisting of 1*X*, 2*X* and 3*X* Tissue and its Probable Origin by (Prof Curt Stern), 179
Non-Enzymic Reactions of Indoles with Coenzyme I (Prof. S. G. A. Alivisatos, G. A. Mourkides and A. Jibril), 718
Non-Equilibrium Theory of Gas–Liquid Chromatography (Dr. M A Khan), 800
Non-Fibrillar Elastin In the Earthworm . Occurrence of a (Dr. P. Van Gansen-Semal), 654
Non-Genetic Mechanism · Reactivation of Poxviruses by a (Dr W. K. Joklik, Pamela Abel and I. H. Holmes), 992
Non-goitrogenous Cabbage (Goitrogenous and) · Level of Sulphydryl Compounds In Rat Liver following Feeding with (Jozef Sedlák), 892
Non-growing Tissues (Growing and in) : Enzymatic Deamination of 5-Deoxycytidylic Acid and of 5-Methyl-5′-deoxycytidylic Acid in (Dr. Eduardo Scarano, Massimo Talarico, Luisa Bonaduce and Benita De Petrocellis), 237
Non-Identity of Triosephosphate Dehydrogenase of Adult Male and Nymph Development Stages of *Triatoma infestans* (Prof M. Agosin, A. Neghme and N Scaramelli), 1052
Non-Infectious Adenovirus Materials : Antigenic Structure of (Dr. H. G. Pereira), 571
Non-Ionic Surfactants · Effects of, upon Animal Tissues (Helen Goldhammer and W R McManus), 317
Non-Protein Sulphydryl Group in the Original Strain and Sub-line of the Ascites Tumour resistant to Alkylating Reagents (Iwao Hirono), 1059
Non-Specific Tolerance of Graft and the Dissociation of Two Types of Immunity (Dr. Milan Hašek and Dr. Jan Hort), 985
Nonulosaminic Acid (Sialic Acid), in Protists (Dr S Aaronson and T. Lessie), 719
Noradrenaline or 3,4-Dihydroxymandelic Acid · Condensation Product of Ethylenediamine with (Kunio Yagi, Toshiharu Nagatsu and Ikuko Nagatsu), 310
Nordisk Institut for Teoretisk Atomfysik, Copenhagen : Årsberetning (1957-58), 850
Nordmann, Jean, and others (edited by) · Documenta Ophthalmologica (Advances in Ophthalmology, Vol 13), *review* by R C Davenport, 42
Norin, E. · The Sediments of the Central Tyrrhenian Sea (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, Sediment Cores from the Mediterranean Sea and the Red Sea, No. 1), 609
Normal Dog Hip Joints : Clearance Rates of Sodium-24, Potassium-42 and Iodine-131 in (Prof Patrick G Laing and Dr. Ik Dong Kim), 898
Normal Human Sera : Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of (Dr. Jan Hirschfeld), 321
Normal Implantation in Ovariectomized Guinea Pigs (Dr. Ruth Deanesly), 327
Normal Susceptibility Levels of *Anopheles pharoensis* Theobald to DDT and Dieldrin (Dr F. Kuhlow), 410
Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years . Essential Fatty Acids of (Prof H Fisher and A S. Feigenbaum), 85
Normal and Experimental Conditions · Diurnal Temperature Variation in the Rhesus Monkey under (Dr Lloyd B. Erikson), 83
Normal and Hageman Plasma : Initiation of Clotting in, by Glass (Dr. Preben Ollendorff), 173
Norman, A. G (edited by) : Advances in Agronomy, Vols. 10 and 11, *review* by G V. Dyke, 1000
Norris, D. O. : Nitrogen in Tropical Agriculture (Biology of Nitrogen Fixation), 941
Norris, D. O , and Henzell, E F. : Nitrogen in Tropical Agriculture (Processes by which Nitrogen is added to the Soil/Plant System), 941
Norris, K H , and others : Ethylene Production by Tomato and Apple Fruits, 902
North Atlantic Ocean · Sediment Cores from the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 7, Nos. 4-5), 609
North Devon Countryside : Preservation of, 935
Northern Advisory Council on Further Education : Training of Technical Teachers, 281
  Report for 1958-59, 281
Norway : Atomic Physics in, 850
Norwegian-produced Milk : Radiocaesium and Potassium-40 in (K. Madshus and J Baarli), 527
Notovny, Helen M , and Owens, Robert G. : Localization of Amino-acids for Histochemical Estimation, 1057
Nováková, V., and Dlouhá, H. Effect of Severing the Olfactory Bulbs on the Intake and Excretion of Water in the Rat, 638
Novel Synthesis of Polypeptides (Dr. J. Oró and C. L. Guidry), 156

Noyes (Marcia C.) Award of the Medical Library Association of America given to Leslie T Morton, 685
Nuclear Congress : Fifth (Comitato Nazionale per le Richerche Nucleari), 127
Nuclear Electronics—Proceedings of the International Symposium on Nuclear Electronics organized by the French Society of Radioelectricians, (Sessions 1-5), *review* by W. Abson, 583
Nuclear Energy (Association des Ingénieurs Electriciens sortis de l'Institut Électrotechnique Montefiore International Information Day about), 440
Nuclear Energy in Britain : Development of, 1
Nuclear Energy : Progress in, Series 1, Physics and Mathematics, Vol. 3, (edited by Donald J. Hughes, J. E. Sanders and J. Horowitz), *review* by Dr. E. R. Rae, 68
Nuclear Energy and Power Reactors · Fundamentals of (Henry Jacobowitz), *review* by Dr. T. E. Allibone, 917
Nuclear Magnetic Resonance—Applications to Organic Chemistry (Prof. J. D Roberts), *review* by Prof. E. R. Andrew, 55
Nuclear Magnetic Resonance : Optical Detection of (J Brossel), 440
Nuclear Magnetic Resonance Spectra (High-Resolution), of Starch Gels : Broadening of the Water Proton Line in (Dr Roger Collison and Dr. M. P McDonald), 548
Nuclear Morphology of Human Spermatozoa (Dr Landrum B. Shettles), 648
Nuclear Phenomena in *Trametes cingulata* Berk (Pritindra Mohan Naha), 903
Nuclear Physics . Low-Energy, *review* by Dr. E. Bretscher, 58
Proceedings of the International Conference on—Low-Energy Nuclear Interactions and Nuclear Structure, Paris 1958 (presented by P. Gugenberger), *review* by Dr. E. Bretscher, 58
Nuclear Propulsion (Marine), for the United Kingdom, 122
Nuclear Radiations · Stimulating Effects of, on Development and Productivity of Rice Plants (Dr. Maung Mya Thaung), 982
Nuclear Reactor Physics (Prof Raymond L. Murray), *review* by J Fell, 68
Nuclear Research, European Organization for . Appointment of J. B. Adams as interim director-general, 523
Personal library of the late Prof. Wolfgang Pauli transferred to the, 1017
Nuclear Science Soviet Reviews of, on the 40th Anniversary of the October Revolution, *review* by Dr T. E. Allibone, 917
Nuclear Science, CENTO Institute of, In Tehran (H. A. C. McKay), 513
Symposium on Recent Developments in the Applications of Nuclear Science for Peaceful Purposes, 685
Nuclear Science, National Institute for Research in Grant of £10,450 to the University of Oxford, for an investigation of the alignment of nuclei for the proton linear accelerator, to be carried out in the Clarendon Laboratory, 126
Nuclear Science for Peaceful Purposes : Recent Developments in the Applications of (CENTO Institute of Nuclear Science Symposium on), 685
Nuclear Test Explosions Radioactivity of the Atmosphere due to Distant (D. H. Peirson, R N Crooks and E M R. Fisher), 224
Nuclear Theory : Introductory (Dr. L. R. B. Elton), *review* by Dr. T. E. Allibone, 917
Lectures on (L D. Landau and Ya. Smorodinsky), translated from the Russian, revised edition, *review* by Dr. T. E. Allibone, 917
Nuclear Theory and its Utilization, *review* by Dr. T E. Allibone, 917
Nucleation in Supercooled Liquids Reduced Temperatures for (Dr. E. R. Buckle), 875
Nuclei of Rat Pineal Parenchymal Cells : Effects of Injection of Bovine Pineal Extract on the (Dr. Uno Holmgren, Dr. Mark D. Altschule and Dr. Richard J Wurtman), 393
Nuclei (Cell) : Quantitative Cytochemical Observations on a Specific Nucleoprotein Reaction in (Dr E A Barnard), 447
Nucleic Acid Fluorochrome Inactivation by Visible Light of Yeast sensitized by a (David Freifelder and Prof Robert B Uretz), 731
Nucleolus Problem (Dr. J. L. Sirlin), 275
Nucleoprotein Reaction (Specific), in Cell Nuclei · Quantitative Cytochemical Observations on a (Dr. E. A. Barnard), 447
Nucleoside 5'-Monophosphates (Acid-soluble) : Heterogeneous Labelling of, during Short *in vivo* Incubation with Phosphate-^{32}P (Dr. T. D. Price, K. K. Tsuboi, H. A. Hinds and P. B Hudson), 158
Nucleotidase (Myosin-5'-) Activity in relation to *p*H of (Darcy Gilmour), 295
Nucleotides (Yeast Ribonucleic Acid and its), as Recovery Factors in Rats receiving an Acute Whole-Body Dose of X-Rays (Prof. J Maisin, P. Dumont and A. Dunjic), 487
Nucleotides (Adenine), and Thyroxine (Succinate,) : Swelling of Fresh and Aged Liver Mitochondria as affected by (Dr. P. Emmelot, C. J. Bos, P. J Brombacher and I. H. M. Reyers), 556
Nucleus In a Basidiomycete (A Bakerspigel), 522
Nucleus to Universe . From—a Course of Selected Lectures in Physics and Astronomy, University of Sydney, 1960 (edited by Prof. S T. Butler and Prof. H. Messel), *review* by G. R. Noakes, 748
Nucleus (Testicular Interstitial Cell), in the Adult Rat Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the (S. L. Liu), 475
Nuffield Foundation : Grant of £2,000 to the Department of Surgery, University of Bristol, for work on vascular disease, 284
Grant of £100,000 to the Zoological Society of London, to found an Institute of Comparative Medicine and to provide two senior research fellowships, 435
Formation of a Unit for the History of Scientific Ideas, 436
Numbers of Erythrocytes : Differences in, between Inbred Lines of Chickens (Dr. P. Jaffe), 978
Nutrition : Minor Elements in (Nutrition Society Symposium on), 939
Nutrition Society : Symposium on Food Losses in Field and Store, 685
Symposium on Minor Elements in Nutrition, 939
Nutting, Prof J. : Appointed to the chair of metallurgy in the University of Leeds, 201 , work of, 201
Nutting, Prof J , and Kelly, Dr. P. : Co-ordination of Light and Electron Microscopy (Microscopical Techniques used in Metallurgy), 672
Nyasaland (Federation of Rhodesia and) : Government Organizations and Statutory Bodies concerned with Scientific Research and Technical Services in the, 202
Nymph Development Stages (Adult Male and), of *Triatoma infestans* · Non-Identity of Triosephosphate Dehydrogenase of (Prof. M. Agosin, A. Neghme and N. Scaramelli), 1052

OAT Variety (A Spring), resistant to the Stem Eelworm (T. Glyn Davies), 813
Oatley, Prof. C. W. : Appointed to the chair of electrical engineering in the University of Cambridge, 680 ; work of, 680
Oberling, Prof. Ch., and others : Ultra-structure of the Clear Cells in Renal Carcinomas and its Importance for the Demonstration of their Renal Origin, 402
Obligate Anaerobes · Specific Inhibition of (Dr. Herbert N. Prince), 816
Observations of Atmospheric Radio Noise (G. R. A. Ellis), 229
Observations on Globin, Haemoglobin and Haptoglobin using a Rabbit Antiglobin Serum (D. S. Rowe and J. F. Soothill), 975
Observations (Quantitative Cytochemical), on a Specific Nucleoprotein Reaction in Cell Nuclei (Dr. E. A. Barnard), 447
Observations (Rocket and Satellite), of the Solar Ultra-violet Spectrum (R. Grant Athay), 1036
Observatory : Mundaring Geophysical, 606
The Watheroo Magnetic (Melbourne), 606
Obtaining Perforated Supporting Membranes for Electron Microscopy : A Simple Method for (V. Drahoš and A. Delong), 104
Occupational Hygiene Society (British) : International Symposium on Inhaled Particles and Vapours, 524
Occurrence of *Falkenbergia rufolanosa* on the West Coast of Scotland (Dr. Elsie Conway), 566
Occurrence of *Halimeda opuntia* var *minor* on Jamaican Shores (P. F. James), 493
Occurrence of a Non-Fibrillar Elastin in the Earthworm (Dr. P. Van Gansen-Semal), 654
Occurrence of the Slipper Limpet, *Crepidula fornicata* L , in Ireland (D. C. Arnold), 95
Occurrence of Whistlers with Geomagnetic Activities : Correlation of (Atsushi Kimpara), 230
Ocean (Atlantic) · Strontium-90 in the 'Mixed Layer' of the (Dr Vaughan T. Bowen and Prof Thomas T. Sugihara), 71
Ocean (North Atlantic) : Sediment Cores from the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Nos. 4-5), 609
Oceanography : Grants for research in Marine Biology or (Challenger Society), 854
O'Connor, Cecilia M. (edited by G E. W. Wolstenholme and) . Steric Course of Microbiological Reactions, *review* by Prof D. C Harrison, 835
O'Connor, Cecilia, and others (edited by) : Ciba Foundation Symposium on Significant Trends in Medical Research, *review* by Prof. L. J. Witts, 42
O'Connor, D. A. . Appointed lecturer in physics at the University of Birmingham, 522, 767
O'Connor, Maeve (edited by G E. W Wolstenholme and) · Ciba Foundation Symposium on the Biosynthesis of Terpenes and Sterols, *review* by Dr D. T. Elmore, 745
O'Connor, Maeve, and others (edited by) Ciba Foundation Symposium on Significant Trends in Medical Research, *review* by Prof L J. Witts, 42
October Revolution · Soviet Reviews of Nuclear Science on the 40th Anniversary of the, *review* by Dr. T E. Allibone, 917
Octopus · Discrimination of Polarized Light by (The Visual System of *Octopus*), (M. F. Moody and J. R Parriss), 839
Regularities in the Retina and Optic Lobes of, in relation to Form Discrimination (The Visual System of *Octopus*), (Prof. J. Z Young), 836
Theories of Shape Discrimination in (The Visual System of *Octopus*), (Dr. N. S. Sutherland), 840
The Visual System of—Regularities in the Retina and Optic Lobes of *Octopus* in relation to Form Discrimination (Prof. J Z Young), 836 ; Discrimination of Polarized Light by *Octopus* (M. F. Moody and J R. Parriss), 839 ; Theories of Shape Discrimination in *Octopus* (Dr. N. S Sutherland), 840
Odagiri, Satoru (Koyanagi, Prof Tatsuo, and) : Effect of Vitamin A on the Cystine Content in Skin of Rats, 809
Oesophagostomum radiatum (Rud. 1803) (Strongylidae.Nematoda) . Effect of X-Rays on the Development of the Infective Larvae of (R. F Riek and R K. Keith), 981
Œstrogen–Insulin Interaction of the Uterus of the Rat (Dr. R. Michel Zilberstein), 635
Ogata, S., and others : Equivalence of Light and Adenosine Triphosphate in Bacterial Photosynthesis, 753
Ogawa, Dr. Yoshito : Synthesis of Contractile Proteins in the X-Irradiated Embryo, 77
Oginsky, E. L , and Umbreit, Wayne W. : An Introduction to Bacterial Physiology, second edition, *review* by Dr. R H. Gorrill, 111
O'Hara, M J. . Appointed lecturer in geology at the University of Edinburgh, 767
Okada, Hideya, and Ishida, Takeo : Brighteners for Nickel Plating and Polarographic Maxima, 152
Okagaki, H., and Sibatani, Prof. A. : Effects of Chloramphenicol on the Recovery of Ultra-violet-Irradiated *Escherichia coli B*, 818
Old World : *Stereobalanus*, a Genus New to the (C. Burdon-Jones and A D. McIntyre), 491
Oldman Formation of Alberta : *Anchiceratops* from the (Wann Langston), 522
Oldroyd, H. · Insect Photography, *review*, 187
Olduvai Australopithecine · The Affinities of the New (Dr. J. T. Robinson), 456 ; (Dr L. S. B. Leakey), 458
Olefines (Lower) : The Industrial Chemistry of the (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 285
Olehy, D A , and others : Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in Chondritic Meteorites, 863
Olfactory Bulbs : Effect of Severing the, on the Intake and Excretion of Water in the Rat (V. Nováková and H. Dlouhá), 638
Olfactory Pathway (Lower), of the Toad : Potential Oscillations In the (Dr. S. F. Takagi and Dr. T. Shibuya), 724
Oliver, R , and Lajtha, Dr. L. G. : Hazard of Tritium as a Deoxyribonucleic Acid Label in Man, 91
Ollendorff, Dr. Preben : Initiation of Clotting in Normal and Hageman Plasma by Glass, 173

100 Years : Changes in the Suffolk Flora during the Past (F. W Simpson,) 771
Onions, W. J (Brown, T. D., and) : Anomalies in the Microscopic Structure of some Wools, 93
Onishi, Satoko, and others : Histochemical Demonstration of Ascorbic Acid in the Locus Coeruleus of the Mammalian Brain, 479
Oocytes (Molluscan) : Golgi Bodies and Golgi Zones in (A Bolognari), 565
Oocytes of *Patella coerulea* L. and *Aplysia depilans* L. : Yolk Formation in, as observed in the Electron Microscope (A. Bolognani), 490
Opalina ranarum Parasitic in *Rana temporaria* : Endocrine Control of Sexual Reproduction in (Dr. M. El Mofty and Prof J D Smyth), 559
Opfell, John B. : Distribution-Free Interpretation of Spray-Drop Data, 822
Ophthalmologica Documenta (Advances in Ophthalmology, Vol. 13), (edited by G von Bahr, G. B. Bietti, J. ten Doesschate, H Fischer von Bunau, J Francois, H Goldmann, H. K. Muller, Jean Nordmann, A. J. Schaeffer and Arnold Sorsby), *review* by R. C Davenport, 42
Ophthalmology Advances in, Vol 13, Documenta Ophthalmologica (edited by G von Bahr, G B. Bietti, J ten Doesschate, H. Fischer von Bunau, J. Francois, H. Goldmann, H. K. Muller, Jean Nordmann, A. J. Schaeffer and Arnold Sorsby), *review* by R. C Davenport, 42
Öpik, Dr. E. J : Awarded the J. Lawrence Smith Medal of the United States National Academy of Sciences, 280, 686 ; work of, 280 ; *erratum*, 361
Optic Lobes of *Octopus* in relation to Form Discrimination : Regularities in the Retina and (The Visual System of *Octopus*), (Prof J Z. Young), 836
Optical Design : Research in, at the Imperial College, London, 934
Optical Detection of Nuclear Magnetic Resonance (J. Brossel), 440
Optical Properties of Bismuth (H D. Mallon and I. G. Runciman), 709
Optical Properties of the αω-Dimethanesulphonoxyalkanes (Dr. A. C. Bishop and Dr. R. D. Marshall), 74
Optical Society of America, and others : Conference on Coherence Properties of Electromagnetic Radiation, 127
Optics and Spectroscopy : Russian–English Glossary of, *review* by Prof. S. I Tomkeieff, 347
Orbit of *Sputnik* III . Profile of Upper-Atmosphere Air Density at the Height of 180-212 km. derived from the (Z. V. Bochníček), 460
Orbits (Satellite) : Density of the Upper Atmosphere and its Dependence on the Sun, as revealed by (D. G. King-Hele and D. M. C. Walker), 928
Oregon State College : Appointment of Prof. Kenton L. Chambers as associate professor and curator of the Herbarium, 1020
Oreopithecus · *Apidium* and (Dr. Elwyn L. Simons), 824
Organ (Male Sex), in certain Fern Species : Purification of a Specific Inducer of the (Ross B. Pringle, Ulrich Naf and Armin C. Braun), 1066
Organic Acid Synthesis in Tomato Roots (J. van Die), 603
Organic Bases : Addition Compounds between Copper Complexes and (R. C Traill), 631
Organic Chemistry in the University of New South Wales, 357
Organic Chemistry : Nuclear Magnetic Resonance—Applications to (Prof. J. D. Roberts), *review* by Prof. E. R. Andrew, 55
  Principles of (T. A. Geissman), now available in England, 17
Organic Chemistry of Sulphur, *review* by Dr. F. G. Mann, 53
  Aspects of the (Prof. Frederick Challenger), *review* by Dr. F. G. Mann, 53
Organic Compounds : Use of Solvents containing Ethyl Iodide in the Investigation of Phosphorescence Spectra of (Dr. I. J. Graham-Bryce and J. M. Corkill), 965
Organic Crystals : Bulk Conductivity in (Dr. M. Kallmann and Dr. M. Pope), 31
Organic Syntheses, Vol. 39 (edited by Max Tishler), *review* by Prof. John Read, 669
Organic Synthesis : Light-initiated, *review* by Prof. R. N. Haszeldine, 53
Organische Photochemie : Praparative (Prof. Alexander Schonberg), *review* by Prof. R. N. Haszeldine, 53
Organismes : Composition Chimique des (Traité de Biochemie Générale, par M. Javillier, M. Polonovski, M. Florkin, P. Boulanger, M. Lemoigne, J. Roche et R. Wurmser, Tome 1), *review* by Prof. F. G. Young, 51
Organization : British Industries and their (Prof. G. C. Allen), fourth edition, *review* by R. Brightman, 70
Organization for European Economic Co-operation : Seminar on the Status and Development of the Teaching of Chemistry, 208
  Seminar on Policy for School Science, 850
  Co-operation in the Field of Scientific and Technical Research, 998
Organization for European Economic Co-operation and the Scientific Future, 520
Organization for European Economic Co-operation and the United States National Science Foundation : Award of Senior Visiting Fellowships in Science, 1019
Organization of Medical Care : Second Report of the Expert Committee on—Role of Hospitals in Ambulatory and Domiciliary Medical Care (United Nations, World Health Organization, Technical Report Series No 176), 202
Organization, Control and Synthesis in Micro-organisms, *review* by Dr. B A. Newton, 49
Organization and Methods, a Service to Management (edited by G. E. Milward), *review* by E S Hiscocks, 62
Organization (Chemical), of Cells, Normal and Abnormal (Conference at the University of Wisconsin), 604
Organizations . European (Political and Economic Planning), 830
Organizations (Government), and Statutory Bodies concerned with Scientific Research and Technical Services in the Federation of Rhodesia and Nyasaland, 202
Orientation of Stearic Acid Monolayers on Silver Single Crystals (Robert T. Mathieson), 301
Origin of Chondrules and Chondritic Meteorites (Dr. Brian Mason), 230
Origin of Rainfall : Surface Temperature of Swedish Lakes and the (Vilhelm Irgens Pettersson), 945
Origin of the Solar System : Dirac's Cosmology and the (Prof. L. Egyed), 621
Origin of Tektites—Solar Furnace Glass (Dr Gerald S. Hawkins and Dr Sumner H Wolfson), 1027 ; High-Temperature Fusion of Possible Parent Materials for Tektites (J. F Lovering), 1028
Origin (Evolutionary), of Sexual Differentiation and the Sex-Ratio (Dr. H. Kalmus and Dr. C. A. B. Smith), 1004
Origin (Probable), by Mitotic Non-disjunction : A Mosaic of *Drosophila* consisting of 1X, 2X and 3X Tissue and its (Prof. Curt Stern), 179
Origin (Renal) Ultrastructure of the Clear Cells in Renal Carcinomas and its Importance for the Demonstration of their (Prof. Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Original Strain and Sub-line of the Ascites Tumour resistant to Alkylating Reagents · Non-Protein Sulphydryl Group in the (Iwao Hirono), 1059
Orkand, Richard K. (Dudel, Dr Josef, and) : Spontaneous Potential Changes at Crayfish Neuromuscular Junctions, 476
Ornithology A Laboratory and Field Manual of (Olin Sewall Pettingill, Jr.), third edition, *review* by J. D. Macdonald, 65
Oró, Dr. J , and Guidry, C L : A Novel Synthesis of Polypeptides, 156
Orogens (Deutsche Geologische Vereiniging Discussion on), 206, 689
  Aspects of (J V. Harrison), 689
Orr, Jr , Dr Clyde : Between Earth and Space, *review* by B. R. Leaton, 68
Osborne, Dr. D V. : Appointed senior lecturer in the Department of Natural Philosophy, St. Salvator's College, St Andrews, 767
Oscillations (Potential), in the Lower Olfactory Pathway of the Toad (Dr. S. F. Takagi and Dr. T. Shibuya), 724
Osmotic Pressure : Gibberellic Acid and (J. van den Ende and P. Koornneef), 327
Osseous Chemistry in Lathyritic Rats : Aortic, Serum, Connective Tissue and (Dr. R. A. Grant, M. Hathorn and Prof. Theodore Gillman), 164
Ostertagia Species in Sheep : Retarded Development of (J. D. Dunsmore), 986
Oundle School Natural History Society : Report, 282
Outcrossing in the Groundnut Variety Mani Pintar : Genetic Instability and (J Smartt), 1070
Outer Secondary Wall on Unbleached Spruce Sulphite Fibres : Structure of the (O. Kallmes and J. A. S Newman), 566
Outline of Human Genetics (Prof. L. S. Penrose), *review* by Prof H. Gruneberg, 347
Ovariectomized Guinea Pigs : Normal Implantation in (Dr Ruth Deanesly), 327
Overseas Development . Assistance from the United Kingdom for (White Paper on), 501
Overseas Territories of the British Commonwealth : Scientific Research in the, 501
Overturning of Stearic Acid Molecules in Monolayers (George K. Gaines, Jun.), 384
Ovicides : Effect of Relative Humidity on Hatching and on Toxicity of, to Eggs of the Red Spider Mite, *Tetranychus telarius* (L.) (Acarina : Tetranychidae), (R. A. Harrison and A. G. Smith), 409
Ovomucoid . Amide Nitrogen Content of (Dr. R. D. Marshall and Prof. A. Neuberger), 311
Ovulating Hormone in the Merino Ewe : Seasonal Differences in (Dr. D. R. Lamond), 971
Owen, Dr. E. C. : Minor Elements in Nutrition (Biochemical Function of some of the Minor Elements), 939
Owens, Robert G. (Notovny, Helen M., and) : Localization of Amino-acids for Histochemical Estimation, 1057
Ox Spleen · Absence of Catecholamines in Cardioactive Acetone Extracts of (Dr. L B. Cobbin and Prof. R. H. Thorp), 473
Oxidase (Monoamine) : Inhibition of, by Benactyzine *in vitro* and *in vivo* (Dr V. Vítek and K. Ryšánek), 244
Oxidase (Monoamine) Inhibitors : Suppression of Increased Capillary Permeability in Injury by (W. G Spector and D. A. Willoughby), 162
Oxidation : Effect of Cathode Surface Roughness and, on Arc Movement (Dr. T. J. Lewis and Dr. P. E. Secker), 30
Oxidation of Beryllium in Carbon Dioxide and in Carbon Monoxide (Dr. S. J. Gregg, Dr. R J. Hussey and Dr. W. B. Jepson), 468
Oxidation of Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles : Vanadium Catalysis of the (Dr. G. M. Martin, E. P. Benditt and N. Eriksen), 884
Oxidation of Hindered Phenols by Electron Spin Resonance : Study of the (Dr. J. E. Bennett), 385
Oxidation (Alkaline), of Cellulose : Catalytic Effects in the (Dr. W. A. Bell), 963
Oxidation (Enzymic), of Stilboestrol labelled with Carbon-14 (P. H. Jellinck), 157
Oxidation (α-Ketoglutarate and Succinate), in E-Deficient Liver Homogenates : Maintenance of, by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr. Laurence M. Corwin and Dr. Klaus Scharz), 1048
Oxidation and Reduction of Metal Ions by Hydrogen Atoms : Mechanism of the (Prof J. Halpern, G. Czapski, J Jortner and Dr. G. Stein), 629
Oxide (Nitric) : Effect of Oxygen and, on the Radiosensitivity of Human Cells in Tissue Culture (Dr. D. L. Dewey), 780
  Molecular Quadrupole Moment of (Dr D. V. G. L. Narasimha Rao), 881
Oxide (Nitrous) : Use of, to discriminate between the Forms of Hydrogen Atoms ($H^{\cdot}$ and H_2^+?) produced by γ-Irradiation of Aqueous Solutions (Prof. F. S. Dainton and Dr. D. B. Peterson), 878
  Use of, to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-violet Light (Prof. F. S. Dainton and S. A Sills), 879
Oxide Layers and Brittle Materials for Microdiffraction : A Technique for Sampling (A. M. Adams, M. A. Silva and Veronica M. Spiers), 147
N-Oxides of the Pyrrolizidine Alkaloids : Detection of (A. T. Dann), 1051
Oxycarboxylic Acids : Acidic Dissociation Constant of Alcoholic Hydroxyls of—Mandelic Acid (Dr M. T. Beck and M. Halmos), 388
Oxygen · Effect of, on the Inactivation of Trypsin by Ionizing Radiation (Prof. J A V Butler and Dr. A B Robins), 697
  Effect of, on the Radiosensitivity of Bacteriophage in the Presence of Sulphydryl Compounds (Dr. P. Howard-Flanders), 485
  Some Effects of Different Tensions of, on the Respiration and Growth of *L*-Strain Fibroblasts (A. R. Fisher), 315
  Flavin Dissociation and Inactivation of Cytochrome b_5 by (A New Type of Autoxidation Reaction), (J. McD Armstrong, Dr J. H. Coates and Prof. R. K. Morton), 1033
Oxygen Consumption in Cattle in relation to Rate of Increase in Environmental Temperature (Prof. H. H. Kibler), 972
Oxygen Consumption (Increased), in Rats during Irradiation : Significance of Adrenals for (Dr. A. Vacek), 90

Oxygen Equilibrium of Haemoglobin from *Thunnus thynnus* (Prof. A. Rossi-Fanelli and E. Antonini), 895
Oxygen Equilibrium of Myoglobin from *Thunnus thynnus* (Prof. A Rossi-Fanelli, E Antonini and R Giuffrè), 896
Oxygen and Nitric Oxide : Effect of, on the Radiosensitivity of Human Cells in Tissue Culture (Dr. D. L. Dewey), 780
Oxygen (Solid) (Copper and), condensed at Very Low Temperatures from a Gas Discharge : Reaction between (Jerome Kruger and William J. Ambs), 794
Oztan, Dr. Nezihe, and Gorbman, Dr. Aubrey : Responsiveness of the Neurosecretory System of Larval Lampreys (*Petromyzon marinus*) to Light, 167

PACIFIC Science Association Tenth Pacific Science Congress, 604
Pacific (Central) : On the Stratigraphy of some Bottom Sections from the (F. Brotzen and A. Dinesen), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 4), 609
Pacific (Central Equatorial) : X-Ray Determination of Phillipsite in a Sediment Core from the (F. Lippman), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 3), 609
Pacific (West) · Sediment Cores from the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Nos 4-7), 609
Pacific (West-) Stratigraphic Correlation (Dr. M. F. Glaessner), 1039
Paddy Soils and Rice Production (Dr. H. Greene), 511
Page, D H. : Co-ordination of Light and Electron Microscopy, 672
Pagel, Dr. B. E. J. · The Lunar Surface, 826
Pai, Prof. Shih-I Introduction to the Theory of Compressible Flow, *review* by Dr. G. K. Batchelor, 1000
'Painted' Mouse Skin . Effect of Molecular Structure upon Concentration of Hydrocarbons in (Mary Burnham and Fred G. Bock), 323
Paintings · Scientific Techniques in the Conservation of, 437
Palmer, Dr. A. A. : Appointed director of the Department of Clinical Pathology in the Kanematsu Memorial Institute of Pathology, Sydney Hospital, 850 ; work of, 850
Palmer, Dr. H. P. (Davies, Dr. R. D., and) · Radio Studies of the Universe, *review* by Dr. J. S. Hey, 59
Palmer, R. C Appointed director of research to Griffin and George, Ltd., 206
Pandalai, Dr. K. M. Recent Advances in Coconut Research in India, 860
Pannekoek, Dr A. J. : Orogens (The Late History of the Orogen), 690
Panning in Ciné Micrography : An Apparatus for (Dr. W. H. Hughes and Dr. P. N. Cardew), 258
Pantin, Prof. C. F. A. : Elected president for 1960-61 of the Linnean Society of London, 766
Paoletti, P., and others : Heats and Entropies of Reaction of Transition Metal Ions with Ethylenediamine, 880
Paper Chromatograms : Specific Detection of Glucose on (Dr. M R. J. Salton), 966
Paper Chromatography—Multiple Spot Formation by Pure Substances (Dr. A H. Beckett, M. A. Beaven and Dr. Ann E. Robinson), 775
Papers (Medical and Technical), prepared by Research Workers (Cyanamid International, London, new list of), 523
Parabiotic Disease : Graft versus Host Reaction in (Dr. B. Nakič, Z. Nakič and J. Silobrčič), 322
Paracrinkle : Potato Virus *M* and (Dr. H. W. Howard and J. Wainwright), 993
n-Paraffin Molecules : Ionization of (W. M. Fairbairn), 151
Paragenesis of Minerals Physiochemical Basis of the Analysis of the (D. S. Korzhinskii), translated from the Russian, *review* by Dr. Bernard E. Leake, 745
Paragenesis (Mineral) : Russian Approach to, *review* by Dr. Bernard E. Leake, 745
Parakeratosis in Cattle . Zinc Sulphate Treatment of (S. P. Legg and L Sears), 1061
Paramecium aurelia . Genetical and Biochemical Studies of the Immobilization Antigens of (J O. Bishop and Dr. G. H. Beale), 734
Parametric Amplification : Experiments in the Field of (B Bollée and G. de Vries), 1019
Parasite (A Blood), from the California Yellow-legged Frog (Donald L. Lehmann), 765
Parasite (Parthenogenetic) · Environmental Determination of Sex in a (F. Wilson and L T Woolcock), 99
Parasites, Imaginary and Real, *review* by Dr. Ben Dawes, 46
Parasites and Parasitic Infections in Early Medicine and Science (Prof. R. Hoeppli), *review* by Dr Ben Dawes, 46
Parasitic Infections in Early Medicine and Science : Parasites and (Prof. R. Hoeppli), *review* by Dr. Ben Dawes, 46
Parenchymal Cells (Rat Pineal) . Effects of Injection of Bovine Pineal Extract on the Nuclei of (Dr. Uno Holmgren, Dr. Mark D. Altschule and Dr Richard J. Wurtman), 393
Parent Materials (Possible), for Tektites : High-Temperature Fision of (Origin of Tektites), (J. F. Lovering), 1028
Pargeter, Philip S. : The Reproduction of Catalogue Cards (Library Association, Pamphlet No. 20), 1020

Phipps, I F.. Nitrogen in Tropical Agriculture (Manufacture and Use of Nitrogenous Fertilizers), 942
Phoca vitulina L. (Harbour Seal) Age Determination in the (A. W. Mansfield and H D Fisher), 92
Phosphatase (Alkaline), in the Meninges and in Meningiomas (Dr. W. J. Pepler), 979
Phosphate-^{32}P Heterogeneous Labelling of Acid-soluble Nucleoside 5'-Monophosphates during Short *in vivo* Incubation with (Dr T. D Price, K. K. Tsuboi, H. A Hinds and P B. Hudson), 158
Phosphate (Tri*para*ethylphenyl): Ataxia in Hens poisoned by (Ann Silver), 766
Phospholipids in Cytoplasmic Particulates Active Transport of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to Phosphorus-32 Turnover in (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
Phosphorescence Spectra of Organic Compounds. Use of Solvents containing Ethyl Iodide in the Investigation of (Dr I. J Graham-Bryce and J. M Corkill), 965
Phosphorus-32: Heterogeneity of Lecithins labelled with (Dr. F. D. Collins), 366
Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates. Active Transport of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
^{32}P-Adenosine Triphosphate Exchange Reaction in Rat Liver Mitochondria: Effects of Fatty Acids on the (K. Ahmed and Dr P. G Scholefield), 1046
Phosphorus/Oxygen Ratios of Isolated Rat Liver Mitochondria: Effect of Pituitary Growth Hormone *in vivo* on the (C. N. Graymore, A. H. Melhuish and A. L Greenbaum), 392
Photobiology: (International Committee on Photobiology International Congress on), 523
Photobiology, International Committee on · International Congress on Photobiology, 523
Photochemie (Organische): Praparative (Prof. Alexander Schonberg), *review* by Prof. R. N. Haszaldine, 53

Photoelectric Spectrometry Group : Meeting on Spectrofluorimetry, 938

Photogrammetry : Aerial (École Nationale des Sciences Géographiques Theoretical and Technical Course on), 127

Photographic Emulsion Mosaics Spectroscopic Applications of (Prof. R W. Nicholls), 715

Photography : Insect, *review* by H. Oldroyd, 187

Photography (Astronomical), at the Telescope (Thomas Rackham), *review* by D. H. P. Jones, 190

Photomultiplier : Use of an Auxiliary Grid to stabilize the Gain of a (Dr. C. F G Delaney and Dr. A J Walton), 625

Photoperiodic Response of some Nigerian Plants (E Njoku), 438

Photoproducts (Low-Temperature) : Regeneration of Visual Pigments from their (Dr. C D B. Bridges), 292

Photoreduction of Chlorophyll : Role of the Triplet State in the (Prof. Robert Livingston and Dr. A C P. Pugh), 969

Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide (J Wawrzyniak and Dr B Sujak), 467

Photosynthesis of Isolated Spinach Chloroplasts Induction Phenomena in (Dr. Knud Vejlby), 652

Photosynthesis (Bacterial) Equivalence of Light and Adenosine Triphosphate in (Dr M Losada, Dr A. V. Trebst, S. Ogata and Prof Daniel I Arnon), 753

Physical Chemistry, Russian Journal of : A translation to be issued by the Chemical Society in co-operation with the Department of Scientific and Industrial Research, 601

Physical Geography (Philip Lake), fourth edition, revised by Prof J. A. Steers, *review* by Prof L. Dudley Stamp, 190

Physical Sciences and Industry Use of Radioisotopes in the (International Atomic Energy Agency Conference on), 284

Physical Society (Institute of Physics and the) : Amalgamation of the, 681

Physical Society (Joint Committee appointed by the Institute of Physics and the) : The Postgraduate Training of Physicists in British Universities 915

Physical Society (Société Française de Physique and the) : Holweck Medal and Prize awarded to J. Brossel, 440

Physical Treatments : Heritable Changes in Lactic Streptococci induced by (B. S Gossling), 868

Physical and Chemical Constants : Tables of, and some Mathematical Functions (Dr G W. C Kaye and Dr. T. H. Laby), twelfth edition, *review* by T. M Yarwood, 67

Physical and Cultural Geography : Practical Field Techniques in (Geographical Association Course in), 1020

Physical and Structural Aspects of Non-destructive Testing of Metals (Non-destructive Testing Group of the Institute of Physics and the Société Française de Métallurgie Conference on), 284

Physicists in British Universities : The Postgraduate Training of—the Report of a Joint Committee appointed by the Institute of Physics and the Physical Society, 915

Physico-chemical Constants of Binary Systems in Concentrated Solutions (Prof. Jean Timmermans), Vol 1, Two Organic Compounds (without Hydroxyl Derivatives) ; Vol 2, Two Organic Compounds (at least one a Hydroxyl Derivative), *review* by Dr. E. F G. Herington, 918

Physics at Liverpool, 201

Physics at Southampton, 762

Physics : International School of (Societa Italiana di Fisica), 17

  Latin-American School of (Centro Brasileiro de Pesquisas Fisicas), 361

  Neutron, *review* by Dr. P A Egelstaff, 187

  Nuclear Reactor (Prof. Raymond L. Murray), *review* by J. Fell, 68

  Plasma (Danish Atomic Energy Commission International Summer Course on), 938

  A Student's Introduction to (Franklin Miller, Jr.), *review* by T. M Yarwood, 68

Physics, Institute of, and the Physical Society : Amalgamation of the, 681

Physics, Institute of, and the Physical Society (Joint Committee appointed by the) : The Postgraduate Training of Physicists in British Universities, 915

Physics, Institute of (Electron Microscopy Group), (Royal Microscopical Society and the) : Symposium on the Co-ordination of Light and Electron Microscopy, 672

Physics, Institute of (Non-destructive Testing Group), and the Société Française de Métallurgie : Conference on Physical and Structural Aspects of Non-destructive Testing of Metals, 284

Physics (Atomic), in Norway, 850

Physics (Cosmical) : Electromagnetic Phenomena in (edited by B. Lehnert), (International Astronomical Union Symposium No. 6, Stockholm 1956), *review* by Dr R H. Garstang, 67

Physics (Experimental), at Cambridge, 762

Physics (Metal) Progress in (edited by Dr. Bruce Chalmers and Dr. R. King), Vol. 7 (1958), Vol. 8 (1959), *review* by Prof. F. C Thompson, 666

Physics (Neutron) : Introduction to (Dr. L. F. Curtiss), *review* by Dr. P. A. Egelstaff, 187

Physics (Nuclear) : Low-Energy, *review* by Dr. E Bretscher, 58

  Proceedings of the International Conference on—Low-Energy Nuclear Interactions and Nuclear Structure, Paris 1958 (presented by P. Gugenberger), *review* by Dr. E. Bretscher, 58

Physics (Plasma), and Magnetohydrodynamics and their Applications to Controlled Thermonuclear Reactions : Bibliography on (J. D. Ramer), 522

Physics (Solid State) : Russian–English Glossary of (edited by I. Emin), *review* by Prof. S. I. Tomkeieff, 347

Physics (Twentieth Century) : A Forerunner of—a Re-view of Larmor's 'Aether and Matter' (Lancelot Law Whyte), 1010

Physics and Astronomy : From Nucleus to Universe—a Course of Selected Lectures in (University of Sydney, 1960), (edited by Prof. S. T. Butler and Prof. H. Messel), *review* by G. R. Noakes, 748

Physics and Chemistry of Glass, Vol. 1, No. 1 (Society of Glass Technology), 601

Physics and Mathematics (edited by Donald J. Hughes, J. E. Sanders and J. Horowitz), Vol 3 (Progress in Nuclear Energy, Series 1), *review* by Dr. E. R Rae, 68

Physics and Philosophy (Prof. Werner Heisenberg), *review* by Prof L. Rosenfeld, 830

Physiochemical Basis of the Analysis of the Paragenesis of Minerals (D S. Korzhinskii), translated from the Russian, *review* by Dr. Bernard E. Leake, 745

Physiological Age for Female *Glossina morsitans* Determination of (D. S. Saunders), 651

Physiology at the London Hospital Medical College, 598

Physiology : Comparative Biochemistry and, Vol. 1, No. 1, 764

Physiology : General, *review* by Prof. A. St. G. Huggett, 52, 284

Physiology of D-Glutamic Acid-requiring Mutants of *Bacillus subtilis* (Haruo Momose and Prof. Yônosuke Ikeda), 818

Physiology (Bacterial) : An Introduction to (E. L. Oginsky and Wayne W. Umbreit), second edition, *review* by Dr. R. H. Gorrill, 111

Physiology (General) : Principles of (W. M Bayliss), fifth edition, by Dr. L E. Bayliss, *review* by Prof A. St. G. Huggett, 52, 284

  A Textbook of (Dr. Hugh Davson), second edition, *review* by Prof. A St. G. Huggett, 52

Physiology (Plant) : Advances in, *review* by Prof W Stiles, 747

  Annual Review of (edited by Leonard Machlis, in association with John G. Torrey), Vol. 10, *review* by Prof. W Stiles, 757

Physique, Société Française de, and the Physical Society : Holweck Medal and Prize awarded to J. Brossel, 440

Phytopathological Society (American) : Plant Pathology, Problems and Progress, 1908-1958 (edited by C. S. Holton, G. W. Fischer, R. W. Fulton, Helen Hart and S E. A. McCallan), *review* by W. C. Moore, 47

Phytophthora palmivora (Butl) Butl. : Variation in, on *Theobroma cacao* L. in West Africa (P. D. Turner), 495

Picard-Ami, Luis, and others : Serotonin Content of the Pineal Glands of Man and Monkey, 480

Picciotto, Prof. E E : Geological Reconnaissance of the Sor-Rondane Mountains (Queen Maud Land), 740

Pickavance, Dr. T. G. : *Obituary* of Prof. H. W. B. Skinner, 354

Picken, Dr. Lawrence Ernest Rowland : Presented with the Trail Award and Medal of the Linnean Society of London, 766

Pickering, Sir George : Elected a Fellow of the Royal Society, 11

Pickman, D. O. : Reactor Fuel Element Technology (Design and Manufacture of Calder-type Fuel Elements), 1026

Picou, Dr D. I. M. : Medical Research in the British Caribbean, 862

Pig (Young) : Body-Weight and Age in relation to the Metabolic-Rate of the (Dr. L. E Mount and J G. Rowell), 1054

Piggott, W. R. (Bellchambers, W. H., and) : Results of the Royal Society's International Geophysical Year Expedition (Ionospheric Measurements), 191

Pigment (Visual), of the Horseshoe Crab, *Limulus polyphemus* (Dr Ruth Hubbard and Prof George Wald), 212

Pigment-producing Strains of *Acetobacter aceti* (J. G. Carr and J. L Shimwell), 331

Pigments (Visual) : Regeneration of, from their Low-Temperature Photoproducts (Dr C. D. B. Bridges), 292

Pigs : Thread Protein and β-Globulin Polymorphism in the Serum Proteins of (G. C. Ashton), 991

Piko, L , and Bomsel-Helmreich, O. : Triploid Rat Embryos and other Chromosomal Deviants after Colchicine Treatment and Polyspermy, 737

Piling-up of Dislocations beneath a Surface Film (A. R. C. Westwood and L. J. Demer), 146

Pilkington, Dr Roger : Robert Boyle, Father of Chemistry, *review* by Dr. W. A. Smeaton, 63

Pillai, G B. : Recent Advances in Coconut Research in India, 861

Pillai, N. G. : Recent Advances in Coconut Research in India, 861

Pillai, R V., and Satyabalan, K. : Recent Advances in Coconut Research in India, 861

Pinch ('Theta') : 'Price' a Pre-ionized (R. D. Medford, A. L. T. Powell, J. D. Herbert, R. C. Pottinger and J K. Wright), 706

Pinched Discharge (Linear) : Growth of Surface Instabilities in a (Dr. R. Latham, J. A. Nation, F. L. Curzon and Dr. A Folkierski,) 624

Pine Weevil (*Hylobius abietis*) : The Large (Forestry Commission, Leaflet No 1), revised edition, 521

Pineal Extract (Bovine) : Effects of Injection of, on the Nuclei of Rat Pineal Parenchymal Cells (Dr. Uno Holmgren, Dr Mark D Altschule and Dr. Richard J. Wurtman), 393

Pineal Glands of Man and Monkey : Serotonin Content of the (Prof. Nicholas J. Giarman, Daniel X. Freedman and Luis Picard-Ami), 480

Pineal Parenchymal Cells (Rat) Effects of Injection of Bovine Pineal Extract on the Nuclei of (Dr. Uno Holmgren, Dr. Mark D. Altschule and Dr. Richard J. Wurtman), 393

Pinus : Effects of *Gibberella fujikuroi* on Fungal Root-Infections of (Dr. Ida Levisohn), 987

Pippard, Prof. A. B. : Elected to the John Humphrey Plummer professorship of experimental physics in the University of Cambridge, 762 ; work of, 762

Pippard, Prof. A. J. S. : A Treatise on Statically Indeterminate Structures, *review*, 582

Pirie, Dr. Antionette : The Biochemistry of the Eye, 352

Pirone, Prof Thomas P., and others : Purification and Properties of Cauliflower Mosaic Virus, 656

Pistons (Rigid), in an Array : Measurements of the Total Acoustic Radiation Impedance of (J S. M. Rusby), 144

Pitt, Frances : The Buzzard, *review*, 65

Pituitary of the Minnow : Distribution of Chromactivating Hormones in the (A. K. Kent), 395

Pituitary Growth Hormone *in vivo* : Effect of, on the Phosphorus/Oxygen Ratios of Isolated Rat Liver Mitochondria (C. N. Graymore, A. H. Melhuish and A. L. Greenbaum), 392

Pituitary Stalk Section : Influence of Cervical Sympathectomy and, upon Milk Secretion in Goats (G. B. Tverskoy), 782

Plack, Dr P. A. : Vitamin A_1 Aldehyde in Hen's Eggs, 234

Planetary Dynamics, *review* by Dr. R. H. Garstang, 60

Plans d'Expérience : Analyse de Variance et (Prof. Daniel Dugué et Prof. Maurice Girault), *review* by Dr. D J. Finney, 68

Plant : The Diseased (Plant Pathology, an Advanced Treatise, edited by J. G. Horsfall and A. E. Dimond, Vol. 1), *review* by W. C. Moore, 47

Plant Cell-Wall : The (Prof. Pieter A Roelofsen), *review* by Prof. R. D. Preston, 920

Plant Cell-Walls : Structure and Growth of, *review* by Prof. R. D. Preston, 920

Plant Cells : Life-like Preservation of Cytoplasmic Detail in (Dr J. Chayen, Prof. G. J. Cunningham, P. B. Gahan and A. A. Silcox), 1068
Plant Extracts : Treatment of Injured and Regenerating Muscles with (S. Hoja and J. Vittek), 283
Plant Extracts (Alcoholic) : An Ion-Exchange Resin Method for the Fractionation of (Dr. Dalton Wang), 326
Plant Pathology : Progress in, *review* by W. C. Moore, 47
Plant Pathology, an Advanced Treatise (edited by J. G. Horsfall and A. E. Dimond), Vol. I, The Diseased Plant, *review* by W. C. Moore, 47
Plant Pathology, Problems and Progress, 1908-1958 (edited by C. S. Holton, G. W. Fischer, R. W. Fulton, Helen Hart and S. E. A. McCallan), *review* by W. C. Moore, 47
Plant Physiology : Advances in, *review* by Prof. W. Stiles, 747
  Annual Review of (edited by Leonard Machlis, in association with John G. Torrey), Vol. 10, *review* by Prof. W. Stiles, 747
Plant Population and Crop Yield (R. Holliday), 22
Plant (Crop) Resistance to Disease : Nature and Exploitation of (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Plants : Bio-electric Potentials of (D. S. Fensom), 853
  Degradation of γ-Methyleneglutamic Acid by (Dr. L. Fowden), 897
  Detoxication during Secondary Growth in (C. M. Stewart), 374
Plants Recorded as Resistant to Root-Knot Nematodes (*Meloidogyne* spp.), (Mary T. Franklin and D. J. Hooper), 684
Plants (Fossil), of the Carboniferous Rocks of Great Britain (Dr. Robert Crookall), second edition, *review* by T. M. Harris, 66
Plants (Nigerian) : The Photoperiodic Response of some (E. Njoku), 438
Plants (Rice) : Stimulating Effects of Nuclear Radiations on Development and Productivity of (Dr. Maung Mya Thaung), 982
Plants (Tropical) : Photoperiodic Response of some, 438
Plaque-forming Ability of Urea- or Phenol-treated T_2 Coli-Phage Preparations (Dr. P. H. Hofschneider), 330
Plaque-forming System (An Indicator), for Demonstration of Interference by Non-cytocidal Strains of Rabies Virus (Dr. Martin M. Kaplan, Dr. Eberhard Wecker, Dr. Zlatko Forsek and Dr Hilary Koprowski) 821
Plasma (Human Serum and) : Antithromboplastin in (Dr. T. G. Scott, Dr. C. Symons and R. L. Markham), 248
Plasma (Normal and Hageman) : Initiation of Clotting in, by Glass (Dr Preben Ollendorff), 173
Plasma Physics (Danish Atomic Energy Commission International Summer Course on), 938
Plasma Physics and Magnetohydrodynamics and their Applications to Controlled Thermonuclear Reactions : Bibliography on (J. D. Ramer), 522
Plasminogen (Profibrinolysin) : Rivanol in the Preparation of (Dr. M. Steinbuch and Dr. S. Niewiarowski), 87
Plastics Institute : Swinburne Award, 126
  Conference on Polymeric Progress, 441
Plateau (Columbia) : Miocene Floras of the, Part I, Composition and Interpretation (Ralph W. Chaney) ; Part 2, Systematic Considerations (Ralph W. Chaney and Daniel I. Axelrod), *review* by Prof. J. Walton, 66
Platelets (Human White Cells and) : Microelectrophoresis of (Dr. William P Creger and Phyllis Menna Thomas), 171
Plating (Nickel) : Brighteners for, and Polarographic Maxima (Hideya Okada and Takeo Ishida), 152
Pleistocene Period—its Climate, Chronology and Faunal Successions (Prof. Frederick E. Zeuner), *review* by D. F. W. Baden-Powell, 833
Pleural Fluid : Mucopolysaccharides of Serum and (Prof C. W. Fishel), 804
Plutonium : Allotropic Transformations in (J. D. Hill), 304
δ-Plutonium Transition Temperature (Dr. R. G. Cope), 539
Pochin, Dr. E. E. : Thyroid Radioiodine Uptake Measurement, *review*, 424
Poisonous Amphibians and Reptiles (Prof. Floyd Boys and Prof. Hobart M. Smith), *review* by A. G. C. Grandison, 269
Poisonous Substances in Agriculture and Food Storage, Advisory Committee on : Appointment of Sir Charles Dodds as chairman, 934
Polansky, T. S , and others : Structure of High-Rank Coals deduced from Helium Densities, 792
Polanyi, Prof. Michael : The Study of Man (Lindsay Memorial Lectures, 1958), *review* by F. I G. Rawlins, 347
Polar Cap Absorption of Cosmic Noise . A Relation between Solar Radio Emission and (Dr. M. R. Kundu and Prof. F. T. Haddock), 610
Polarimetric Method . Rate of Ligand Exchange with its Metal Complex by a (B. Bosnich, Dr. F. P. Dwyer and Dr. A. M. Sargeson), 966
Polarizability (Solvent) : Effect of, on the Ultra-violet Spectral Shifts of Aromatic Compounds (Dr. F A. Bovey and S. S. Yanari), 1042
Polarized Light : Discrimination of, by *Octopus* (The Visual System of *Octopus*), (M. F. Moody and J R. Parriss), 839
Polarographic Maxima : Brighteners for Nickel Plating and (Hideya Okada and Takeo Ishida), 152
'Polarons' (Self-trapped Electrons) : Primary Processes in the Action of Ionizing Radiations on Water—Formation and Reactivity of (Prof. Joseph Weiss), 751
Policy for School Science (Organization for European Economic Co-operation Seminar on), 850
Political and Economic Planning : European Organizations, 830
Political and Economic Science, British Library of : Annual Report for 1958-59, 520
Polley, Margaret J , and others : Role of C'_4 in the Antiglobulin Reaction, 482
Polli, E E., and others · Infra-Red Spectra of Deoxyribonucleic Acids from Human Leucocytes, 964
Pollution (Water), by Trade Effluents, 210
Polmear, I. J. · A Trace Element Effect in Alloys based on the Aluminium–Zinc–Magnesium System, 303
Polonovski, M., et autres : Traité de Biochimie Générale, Vol I, Composition Chimique des Organismes, *review* by Prof. F G. Young, 51
Polycytidylic Acid : Polyinosinic plus—a Crystalline Polynucleotide Complex (Dr David R. Davies), 1030
Polyelectrolytes (Synthetic), as Tumour Inhibitors (Dr. William Regelson, Stephan Kuhar, Marvin Tunis, Joseph Fields, John Johnson and Earl Gluesenkamp), 778
Polyethylene : Effect of a Second Crystalline Modification in, on X-Ray Crystallinity Measurements (Dr. C. G Vonk), 962
  Reaction of Active Nitrogen with (Dr. J. L. Weininger), 546
Polyinosinic plus Polycytidylic Acid—a Crystalline Polynucleotide Complex (Dr. David R. Davies), 1030
Polymer Formation in Irradiated *p*-Xylene (Francis van Hecke), 382
Polymeric Progress (Plastics Institute Conference on), 441
Polymerization of Crystalline Methacrylic Acid initiated by Ultra-violet Radiation (Dr. C. H. Bamford, A. D. Jenkins and J. C. Ward), 713
Polymers : Analytical Chemistry of (edited by Gordon M. Kline), Part I, Analysis of Monomers and Polymeric Materials—Plastics, Resins, Rubbers, Fibres, *review* by Prof. C. E. H. Bawn, 52
  Complexes of Calcium–Montmorillonite with (W. W. Emerson), 573
Polymers (Dimethyl Siloxane) : Proton Magnetic Resonance in a Series of—a Specific Long-Chain Effect? (Dr. J. G. Powles and A. Hartland), 26
Polymers (Hydrocarbon) : Mode of Radiation-induced Cross-Linking in (T. F Williams), 544
Polymorphism (β-Globulin), in the Serum Proteins of Pigs · Thread Protein and (G. C. Ashton), 991
Polynucleotide Complex : Polyinosinic plus Polycytidylic Acid—a Crystalline (Dr. David R Davies), 1030
Polyoma Virus (*S E*) : Development of Resistance in Mice to Tumour Induction by (Sarah E. Stewart, Bernice E. Eddy, Marjean Irwin and Stephanie Lee), 615
Polypeptides : A Novel Synthesis of (Dr. J. Oró and C. L Guidry), 156
Polysaccharides : Enhancement of Peroxidase Action by (Dr. B. Z. Siegel and Dr. S. M. Siegel), 391
  Synovial Proliferation induced by (D. P. Page Thomas, J. T. Dingle and E. R. Cook), 251
Polyspermy : Triploid Rat Embryos and other Chromosomal Deviants after Colchicine Treatment and (L. Piko and O. Bomsel-Helmreich), 737
Polystyrene Resin (Sulphonated) : Behaviour of some Aldehydes on a (Dr. S. A. Barker, K. Murray and Prof. M. Stacey), 469
Polyvinyl Benzoate Monolayers (Herman E. Ries, jun., Nicky Beredjick and Joseph Gabor), 883
Pond Animals : Suffolk Ponds and (J. E. Marston), 771
Ponder, Dr Eric, and Ponder, Ruth V. . Interaction between Albumin, Lecithin and Cephalin, 235
Ponder, Ruth V. (Ponder, Dr. Eric, and) : Interaction between Albumin, Lecithin and Cephalin, 235
Ponds and Pond Animals : Suffolk (J. E. Marston), 771
Pontén, Dr. J : Awarded a grant from the Tata Memorial Trust, for research on leukaemia and allied diseases, 1020
Pool, W. A. (edited by) : The Veterinary Annual, 1959, *review* by G. N. Gould, 667
Poon-King, Dr. T. . Medical Research in the British Caribbean (Treatment of Diabetes mellitus with Chlorpropamide), 862
Pope, Dr. M. (Kallmann, Dr. H., and) : Bulk Conductivity in Organic Crystals, 31
Population in 1958, 765
Population : Increase of Settlement Size and, since the Inception of Agriculture (Dr Max Pettersson), 870
Population (Japanese) : Haptoglobin Types in a (Prof. E. Matsunaga and Kyoko Murai), 320
Population (Plant), and Crop Yield (R. Holliday), 22
Population Bulletin, Vol. 15, No. 6, Fertility of College Graduates (Population Reference Bureau, Inc.), 22
Population Genetics : Electronic Computers in (W. F. Bodmer), 851 ; (J. L. Crosby), 851
Population Reference Bureau, Inc. : *Population Bulletin*, Vol. 15, No. 6, Fertility of College Graduates, 22
Population and Progress in the Far East (Prof. Warren S. Thompson), *review* by Prof. W. D. Borrie, 664
Porphyra tenera–Cytochrome 553 : Crystallization of an Algal Cytochrome (Dr. Sakae Katoh), 138
Porter, Prof. G. : Elected a Fellow of the Royal Society, 11
Position of the Gene determining the Diploid-like Meiotic Behaviour of Wheat (Dr. Ralph Riley, Victor Chapman and Gordon Kimber), 259
Position of the Proximal Centriole in Flagellate Spermatozoa (Prof. Vishwa Nath, Brij L. Gupta and L. C. Mittal), 899 ; (Dr. J. Bronté Gatenby and R. S Mathur), 900
Position (Electrophoretic), of Haptoglobin Mixtures : Variations in, in Agar-gel Electrophoresis (Dr. Jan Hirschfeld), 894
Position (Electrophoretic), of an Indoxylacetate Splitting Component in the α_2-Globulin Region of Normal Human Sera : Agar-gel Electrophoretic Demonstration of Individual Variations in (Dr. Jan Hirschfeld), 321
Possibility of a Self-sustaining Corbino Disk (Dr. D. Midgley), 377
Possible Basis for Immunological Tolerance (Dr. D. T. Denhardt), 728
Possible Factor in Sympatric Speciation : Selective Visits of Butterflies to Flowers—a (K. R. Dronamraju), 178
Possible Fundamental in the Behaviour of Young Nidifugous Birds (Dr. Peter M. Driver), 416
Possible Mechanism for the Anti-Inflammatory Action of Corticosteroids : Accumulation of Substrate by Isolated Rat Diaphragm—a (Prof. Ira G Wool), 728
Possible Parent Materials for Tektites : High-Temperature Fusion of (Origin of Tektites), (J. F. Lovering), 1028
Possible Relation to the Circulation of Amniotic Fluid : Ultra-Structure of Human Amnion and its (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Possible Role of Excited Dimers in Energy Transfer Processes : Radiative Life-time of the Pyrene Dimer and the (Dr. B. Stevens and E. Hutton), 1045
Postgraduate Courses, 1960-61 (Imperial College of Science and Technology, London), 206
Postgraduate Students : The Training of, 915
Postgraduate Training of Physicists in British Universities—the Report of a Joint Committee appointed by the Institute of Physics and the Physical Society, 915
Postgraduate Training Grants in Fishery Research (Development Commissioners, the Ministry of Agriculture, Fisheries and Food, and the Scottish Home Department), 360
Post-yield Region . Supercontraction of Wool Fibres and Creep in the (Dr. K. J Whiteley), 473
Postlethwaite, Dr. R., and Maitland, Prof. H. B. : Eclipse Phase of Vaccinia Virus, 335
Postural Changes in Chlorpromazine Hypothermia (Dr. D. Svorad), 240

Potamopyrgus jenkinsi Smith (Snail) : Effect of a Sewage Effluent Discharge on the Deposition of Calcium Carbonate on Shells of the (R. W. Edwards and J. Heywood), 492
Potassium : Isotopic Composition of (B. R. F. Kendall), 225
Potassium Chloride (Single Crystals of), containing Barium Chloride : Micromosaic Patterns in (J. Ewles and J. B. Dawson), 381
Potassium Hydroxide : Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or (J. Wawrzyniak and Dr B Sujak), 467
Potassium Iodide irradiated with Ultra-violet Light : Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of (Prof. F. S. Dainton and S A Sills), 879
Potassium-Level (Supernatant) . Effect of, on Cardiac Activity in Quantitative Tissue Culture (Prof A. W. B Cunningham, K. Kleutch and W. Herbst), 241
Potassium Permeability (Delayed) : Action Potentials in Active Tissue with (Dr. E. P. George), 889
Potassium Trivanadate : Crystal Structure of (Dr. Stanley Block), 540
Potassium-40 in Norwegian-produced Milk : Radiocaesium and (K. Madshus and J Baarli), 527
Potassium-42 Uptake by the Rat Muscle *in vitro* : Effect of Denervation on (Dr. Z. Drahota and O. Hudlická), 396
Potassium-42 and Iodine-131 (Sodium-24,) Clearance Rates of, in Normal Dog Hip Joints (Prof Patrick G. Laing and Dr. Ik Dong Kim), 898
Potato Virus *M* and Paracrinkle (Dr. H. W. Howard and J. Wainwright), 993
Potential' ('Equivalent Redox) : Significance of the, in Aqueous Solutions under Ionizing Radiation (Dr. G. H. Cartledge), 370
Potential Changes (Membrane), associated with Stimulation of Smooth Muscle by Adrenalin (G Burnstock), 727
Potential Changes (Spontaneous), at Crayfish Neuromuscular Junctions (Dr. Josef Dudel and Richard K. Orkand), 476
Potential Oscillations in the Lower Olfactory Pathway of the Toad (Dr. S. F Takagi and Dr. T. Shibuya), 724
Potential Theory of Unsteady Supersonic Flow (Prof. John W Miles), *review* by L E. Fraenkel, 505
Potentials (Action), in Active Tissue with Delayed Potassium Permeability (Dr E. P. George), 889
Potentials (Bio-electric), of Plants (D. S Fensom), 853
Potentials (Extracellular Unit Action), from the Central Nervous System : 'Weightless' Micro-electrodes for Recording (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Potentials (Intracellular), in Rat Atria during and after Vagal Stimulation or Acetylcholine Administration (P. A. Biersteker, J. Th. F. Boeles and L. N. Bouman), 637
Potentials (Spontaneous), from Explants of Brain Tissue in Culture (Prof. A. W. B. Cunningham, Marshall Dougherty and B J Rylander), 477
Pottinger, R. C., and others : 'Prize', a Pre-ionized 'Theta' Pinch, 706
Pound, Glenn S , and others : Purification and Properties of Cauliflower Mosaic Virus, 656
Powder Metallurgy (Metal Powder Industries Federation International Conference on), 361
Powell, A L. T., and others : 'Prize' a Pre-Ionized 'Theta' Pinch, 706
Powell, Prof. Loyd E , and Pratt, Charlotte : A Comparison of Adhering and Abscising Fruits of Peach treated with N-1-Naphthyl Phthalamic Acid, 814
Power Output 1960-65 : Estimated United Kingdom, 122
Power Reactors (Nuclear Energy and) : Fundamentals of (Henry Jacobowitz), *review* by Dr. T. E Allibone, 917
Powles, Dr J G , and Hartland, A : Proton Magnetic Resonance in a Series of Dimethyl Siloxane Polymers—a Specific Long-Chain Effect?, 26
Poxviruses Reactivation of, by a Non-Genetic Mechanism (Dr. W. K. Joklik, Pamela Abel and I H Holmes), 992
Practical Field Techniques in Physical and Cultural Geography (Geographical Association Course in), 1020
Practice : Heat Treatment (British Iron and Steel Research Association Conference on), 523
Practice of Sedimentation : Theory and, *review* by Dr K. V. Shooter, 56
Prasannakumari, T. O. : Recent Advances in Coconut Research in India, 861
Pratt, Charlotte : Changes in Structure of a Periclinal Chromosomal Chimera of Apple following X-Irradiation, 255
Pratt, Charlotte (Powell, Prof. Loyd E., and) : A Comparison of Adhering and Abscising Fruits of Peach treated with N-1-Naphthyl Phthalamic Acid, 814
Precambrian (Late) Fauna in South Australia (M F Glaessner and B. Daily), 205
Precipitate (Benzidine Sulphate) : A Modification for Washing the, in the Determination of Sulphate (Dr. I P. T. Hakkinen), 232
Precipitating Antibody in Trypanosomiasis of Cattle and other Animals (A. R. Gray), 1058
Precursor of Antigen 34 in *Salmonella* : Somatic Antigen 15 as a (Hisao Uetake and Shin Hagiwara), 261
Predehydroxylation State of Kaolinite (Dr. J. J. Fripiat and F. Toussaint), 627
Predissociation (A New), in Nitrogen (Alf Lofthus), 302
Pregnant Mare Serum Gonadotropin : Effect of *p*H on Biological Activity of (Bengt H. Persson and Stig E. J. Melander), 163
Pre-Ionized 'Theta' Pinch : 'Prize', a (R. D Medford, A. L. T. Powell, J. D. Herbert, R. C. Pottinger and J. K. Wright), 706
Preliminary Flight Tests of an Atomic Clock in Preparation of Long-range Clock Synchronization Experiments (Friedrich H. Reder and Gernot M R. Winkler), 592
Preparation for Direct Entry into First Degree Courses in the Faculty of Science : Report of an Enquiry into the Suitability of the General Certificate of Education Advanced Level Syllabuses in Science as a (University of Birmingham), 687
Preparation of Long-range Clock Synchronization Experiments : Preliminary Flight Tests of an Atomic Clock in (Friedrich H. Reder and Gernot M. R. Winkler), 592
Preparation of Plasminogen (Profibrinolysin) : Rivanol in the (Dr. M. Steinbuch and Dr. S Niewiarowski), 87
Preparation of Pure Standard Métallic Perchlorate Solutions (E. P. Serjeant), 963
Preparation of Tritiated Water Samples by Distillation (J. D. Simpson and Dr. J. R. Greening), 467
Preparation of Ultra-Thin Sections : Water-Soluble Methacrylates as Embedding Media for (Dr. O. Wichterle, Dr. P. Bartl and Dr. M. Rosenberg), 494
Preparation for University Work : Sixth-Form Science as a (Dr W. L. Sumner), 686
Preparations (*T_2* Coli-Phage) : Plaque-forming Ability of Urea- or Phenol-treated (Dr P H. Hofschneider), 330
Presence of Adenosine Triphosphate : Effect of Electrical Stimulation on a Muscle Fibre Model in the (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Presence of Chicken Tumour Virus in the Sarcoma of the Adult Rat inoculated after Birth with Rous Sarcoma Tissue (Dr. Jan Svoboda), 980
Presence of Gibberellin-like Substances in Lettuce Seed (Dr. S. Blumenthal-Goldschmidt and Prof. A. Lang), 815
Presence of Protein in some Serum Filtrates (Dr. F. J. Scandrett), 558
Present Problems in World Affairs (Le Play Society Conference on), 606
Preservation of Documents (W K. Wilson and B. W. Forshee), 124
Preservation of North Devon Countryside, 935
Preservation (Life-like), of Cytoplasmic Detail in Plant Cells (Dr. J. Chayen, Prof G J Cunningham, P. B Gahan and A A Silcox), 1068
Press Arrangements for Scientific, Medical and Technical Conferences : Guide to (edited by Ronald Bedford), 437
Pressman, Dr David, and Radzimski, Dr Gerald : Iodination of Specific Sites on Bovine Serum Albumin, 1049
Pressure (High-) Phase Transformations in Laboratory Mechanical Mixers and Mortars (Frank Dachille and Prof Rustum Roy), 34
Pressure (Osmotic) : Gibberellic Acid and (J. van den Ende and P. Koornneef), 327
Pressure (Rock), in Mines : The Measurement of (Nils Hast), 936
Preston, Prof. R. D. . Structure and Growth of Plant Cell-Walls, *review*, 920
Preston, Prof R. D. (Aronson, J M., and) : Cell Wall Formation in Spores of the Fungus *Allomyces*, 95
Preuss, Dr. H. : Die Methoden der Molekulphysik und ihre Anwendungsbereiche, *review* by Prof C A. Coulson, 54
Prevalence (Distribution and), of *Fusarium moniliforme* Sheld. (*Gibberella fujikuroi* (Saw.) Wr) producing Substances with Gibberellin-like Biological Properties (Prof. W. L. Gordon), 698
Prevention (The Chemical), of Cardiac Neuroses (Prof. Hans Selye), *review* by Dr D C. Deuchar, 423
Preventive Aspects in the Teaching of Pathology (World Health Organization, Technical Report Series No. 175), 602
Priapulus caudatus Lamarck, 853
Price, Dr. Derek J. de Solla, and others : Heavenly Clockwork—the Great Astronomical Clocks of Medieval China, *review* by Dr. F. A. B. Ward, 834
Price, Dr. T. D., and others : Heterogeneous Labelling of Acid-soluble Nucleoside 5'-Monophosphates during Short *in vivo* Incubation with Phosphate-^{32}P, 158
Primary Neoplastic Growth : Chromosomes in (Dr. K. Bayreuther), 6
Primary Processes in the Action of Ionizing Radiations on Water—Formation and Reactivity of Self-trapped Electrons ('Polarons'), (Prof. Joseph Weiss), 751
Primary Source of Sulphate in Tidal Swamp Soils from Sierra Leone : Sea-Water as the (J C. D. Watts), 308
Primary Structure of the Protein of Tobacco Mosaic Virus (F. A. Anderer, H. Uhlig, E. Weber and Prof. G. Schramm), 922
Primates : Man among the, *review* by Dr. G. G. Simpson, 665
Primates (Laboratory) : Diseases of (Prof. Theodore C. Ruch), *review* by Dr C. R. Cold, 506
Prince, Dr. Herbert N. : Specific Inhibition of Obligate Anaerobes, 816
Principal Works of Simon Stevin (edited by Prof. D J Struik), Vol. 2A, Mathematics ; Vol. 2B, Mathematics, *review* by Dr. J. F. Scott, 60
Principles : Chemical Process (Prof. Olaf A. Hougen, Prof Kenneth M. Watson and Prof Roland A. Ragatz), Part 2, Thermodynamics, second edition, *review* by L. E Marc de Chazal, 1003
Principles of the Extraction of Metals (Dr D. J. G Ives), 765
Principles of General Physiology (W M. Bayliss), fifth edition, by Dr. L. E. Bayliss, *review* by Prof. A St. G. Huggett, 52, 284
Principles of Geology (James Gilluly, A. C. Waters and A O. Woodford), second edition, *review* by Dr. J. V. Harrison, 57, 440
Principles of Organic Chemistry (T. A. Geissman), now available in England, 17
Principles of Quantum Electrodynamics (Walter E. Thirring), translated from the German by J. Bernstein, *review* by Prof. N. Kemmer, 999
Pringle, Ross B., and others Purification of a Specific Inducer of the Male Sex Organ in certain Fern Species, 1066
Prior, J. R. (Male, J. C , and) : Intrinsic Recombination Radiation in Diamond, 1037
'Prize', a Pre-ionized 'Theta' Pinch (R. D Medford, A. L. T. Powell, J. D. Herbert, R. C. Pottinger and J. K. Wright), 706
Prizes (Nobel) . Tenth Annual Meeting of Holders of, 938
Probability and Statistics (Prof Walter L. Smith), 338
Probable Origin by Mitotic Non-disjunction : A Mosaic of *Drosophila* consisting of 1*X*, 2*X* and 3*X* Tissue and its (Prof. Curt Stern), 179
Probert-Jones, J. R. : Meteorological Use of Pulsed Doppler Radar, 271
Problem : The Nucleolus (Dr. J. L. Sirlin), 275
Problem of Language in Publications of Works in Scientific and other Fields of Learning (Prof. D. Keilin), 912
Problem of Noise, Committee on the : Ready to receive evidence, 1020
Problem der Tiefseesande im westlichen Teil des aquatorialen Atlantiks : Ein Beitrag zum (F W. Locher), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 5), 609
Problem (Human Fertility). Modern Science and the (Dr Richard Meier), *review* by Dr. Kenneth Walker, 188
Problem (Mullite) : A New Interpretation of the (J. H. Welch), 545
Problems : Arid Zone (Unesco Symposium on), 284
Problems of Human Fertility, *review* by Dr. Kenneth Walker, 188
Problems of Motion of Artificial Satellites : Figures of Equilibrium of Celestial Bodies, with Emphasis on (Prof. Zdenek Kopal), *review* by D. G. King-Hele, 747
Problems of Perception (R. J. Hirst), *review* by Prof. M. D. Vernon, 919

Problems of Progress in Industry : No. 5, Human Problems of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G M. Stalker), (Department of Scientific and Industrial Research), 419
Problems of Space Flight, *review* by D. G. King-Hele, 59
Problems (Biological), of Grafting—a Symposium sponsored by the Commission Administrative du Patrimoine Universitaire de Liège and the Council for International Organizations of Medical Sciences), *review* by Dr. D. M. V. Parrott, 51
Problems (Human), of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G. M. Stalker), (Department of Scientific and Industrial Research, Problems of Progress in Industry, No 5), 419
Problems (Human), of Innovation in Industry, 419
Problems (Mental Health), of Automation : Study Group on the (World Health Organization, Report Series No. 183), 364
Problems (Present), in World Affairs (Le Play Society Conference on), 606
Problems (Scientific), of Crop Protection (Hungarian Academy of Sciences International Conference on), 523
Processes : Textile Engineering (edited by Prof A H Nissan), *review* by Prof C. S Whewell, 189
Processes (Energy Transfer) : Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in (Dr. B Stevens and E. Hutton), 1045
Processes (Primary), in the Action of Ionizing Radiations on Water—Formation and Reactivity of Self-trapped Electrons ('Polarons'), (Prof Joseph Weiss), 751
Producing Free Radicals from Solids The Tesla-coil Method for (Dr C. H. Bamford, A D Jenkins and J C. Ward), 712
Product (Condensation), of Ethylenediamine with Noradrenaline or 3,4-Dihydroxymandelic Acid (Kunio Yagi, Toshiharu Nagatsu and Ikuko Nagatsu), 310
Production of Calcium-47 : International Co-operation and the, 1018
Production of Shikimic Acid by *Penicillium griseofulvum* Dierckx (Prof. Paul Simonart and Anselme Wiaux), 78
Production of Vibrationally Hot Molecules in Free-Radical Reactions . A Model to account for the (Dr. J. P. Simons), 551
Production (Erythropoietine), in the Dog (Dr. F. W Kinard, F F. Griffin, jun., and F. W. Kinard, jun.), 561
Production (Ethylene), by Tomato and Apple Fruits (D. F Meigh, K. H. Norris, C. C. Craft and M. Lieberman), 902
Production (Experimental), of Liver Cancer : Effect of 3-Amino-1,2,4-triazole on the (Munemitsu Hoshino), 174
Production (Rice) : Paddy Soils and (Dr. H. Greene), 511
Productivity of Rice Plants : Stimulating Effects of Nuclear Radiations on Development and (Dr. Maung Mya Thaung), 982
Products Council (Colonial) : Report for 1958-59, 501
Products (Fission) : An Assessment of the Quantities of, likely to be found in Milk in the Event of Aerial Contamination of Agricultural Land (Dr R. J Garner), 1063
Professional Civil Servants, Institution of . Fifteenth Annual Report (1959), 436, 1017
Professional Status : Higher National Certificates and, 123
Profibrinolysin (Plasminogen) : Rivanol in the Preparation of (Dr. M. Steinbuch and Dr. S. Niewiarowski), 87
Profile of Upper-Atmosphere Air Density at the Height of 180-212 km. derived from the Orbit of *Sputnik* III (Z. V. Bochníček), 460
Profile (Wind), in Thermally Stratified Flow (W. C. Swinbank), 463
Profitable Farming : Fertilizers and (Dr. G. W. Cooke), *review* by G. V. Jacks, 424
Progress : Polymeric (Plastics Institute Conference on), 441
Progress in the Far East : Population and (Prof. Warren S. Thompson), *review* by Prof. W D. Borrie, 664
Progress of Geology in the U.S.S R. (Prof. S. I. Tomkeieff), 438
Progress in Industry : Problems of, No. 5, Human Problems of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G. M. Stalker), (Department of Scientific and Industrial Research), 419
Progress in Metal Physics (edited by Dr. Bruce Chalmers and Dr. R. King), Vol. 7 (1958), Vol. 8 (1959), *review* by Prof. F. C. Thompson, 666
Progress in Nuclear Energy : Series I, Physics and Mathematics, Vol. 3 (edited by Donald J Hughes, J E. Sanders and J Horowitz), *review* by Dr. E. R. Rae, 68
Progress in Plant Pathology, *review* by W C. Moore, 47
Progressive Development in *Habrobracon* Females : Divergence between Lethal Doses and Sterilizing Doses of X-Rays with (Dr. Howard E. Erdman), 254
Proliferation (Synovial), induced by Polysaccharides (D. P. Page Thomas, J. T. Dingle and E. R. Cook), 251
Proneness of Drivers to Road Accidents (Dr R. J. Smeed), 273
Proof : Godel's (Ernest Nagel and James R. Newman), *review* by F. I. G. Rawlins, 61
Propagation of Clones of *Hevea brasiliensis* by Cuttings : Developments in the (G H. Tinley and R. J. Garner), 407
Propagation Constants (Ultrasonic), in Supercooled Salol (Dr. S Parthasarathy and V N Bindal), 145
Propellants : Rocket (Francis A. Warren), *review* by Dr. W. B Littler, 58
Properties of Cauliflower Mosaic Virus : Purification and (Prof. Thomas P. Pirone, Glenn S Pound and Robert J. Shepherd), 656
Properties of the Iridium–Platinum Alloys : Constitution and (Dr. A. S. Darling), 211
Properties (Antimalarial), of some Guanidine Derivatives (Y. Ch. Chin, Y. Y. Wu, B. Skowrońska-Serafin, Prof. T. Urbański and J. Venulet), 170
Properties (Coherence), of Electromagnetic Radiation (United States Air Force, the Optical Society of America and the University of Rochester Conference on), 127
Properties (Electrical and Magnetic), of β-Carotene Triiodide (Dr. Charles M. Huggins and Dr. Oliver H LeBlanc, jun), 552
Properties (Gibberellin-like Biological) . Distribution and Prevalence of *Fusarium moniliforme* Sheld. (*Gibberella fujikuroi* (Saw.) Wr.) producing Substances with (Prof. W. L Gordon), 698
Properties (Mechanical), of Solids : Lattice Defects and the (International Union of Crystallography Symposium on), 1020
Properties (Optical), of Bismuth (H. D Mallon and I. G Runciman), 709
Properties (Optical), of the $\alpha\omega$-Dimethanesulphonoxyalkanes (Dr. A. C. Bishop and Dr. R. D. Marshall), 74
Properties (Rheological), of Barytes Suspensions (A. W Earnshaw and J. C. Sproson), 378
Properties (Rheological), of Dough made from Wheaten Flour : A Role for Thiol and Disulphide Groups in Determining the (R. Frater, Dr. F J. R Hird, H. J. Moss and J. R. Yates), 451
Properties (Wetting), of Insect Cuticle (J. W. L. Beament), 408
Property (Industrial), International Association for the Protection of : Twenty-fourth Congress, 440
Propulsion : Rocket (Marcel Barrère, Prof André Jaumotte, Prof. Baudouin Fraeijs de Veubeke and Jean Vandenkerckhove), *review* by J E P. Dunning, 186
Propulsion (Marine Nuclear), for the United Kingdom, 122
Protection of Industrial Property, International Association for the . Twenty-fourth Congress, 440
Protection (Crop) : Scientific Problems of (Hungarian Academy of Sciences International Conference on), 523
Protein in some Serum Filtrates : Presence of (Dr. F. J. Scandrett), 558
Protein of Tobacco Mosaic Virus Primary Structure of the (F A. Anderer, H. Uhlig, E Weber and Prof G Schramm), 922
Protein (Iodinated), in the Young Mouse : Selection of (W. A. Hemmings), 399
Protein (Native), and Inorganic Salts : Specific Interaction of (Folke Rønnike), 88
Protein (A New Copper), from *Chlorella ellipsoidea* (Dr Sakae Katoh), 533
Protein (Thread), and β-Globulin Polymorphism in the Serum Proteins of Pigs (G C Ashton), 991
Protein Administration . Changes in the Levels of Adenosine Triphosphate and Glycogen in the Liver caused by (Dr. Catherine M. Clark, Dr. G A. J. Goodlad, Dr. J. Chisholm and Dr. H. N. Munro), 719
Protein Components from Turnip Yellow Mosaic Virus (Dr. J. M. Kaper), 219
Protein Structure and Function (Brookhaven National Laboratory thirteenth Symposium in Biology), 361
Proteins (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 767
Proteins . Diffusion of, through Lipophilic Agar Cells (Dr. Ch. Wunderly), 885
Proteins labelled with various Fluorescent Dyes : Depolarization of the Fluorescence of (C. S. Chadwick, Dr. P. Johnson and E. G. Richards), 239
Proteins in Honeybee Larval Food : Electrophoretic Components of the (N G. Patel, M H. Haydak and T A Gochnauer), 633
Proteins from Surface Tissue of the Tongue . Amino-Acid Composition of (Dr C J. Barnes and Dr L. N. Ferguson), 617
Proteins (Aggregating), in the Ultracentrifuge Concentration-Dependent Sedimentation of (Dr. G A. Gilbert), 882
Proteins (Cellular) : Ribonucleic Acids and the Synthesis of (Prof. J. Brachet), 194
Proteins (Contractile), in the X-Irradiated Embryo : Synthesis of (Dr. Yoshito Ogawa), 77
Proteins (Serum), of Pigs . Thread Protein and β-Globulin Polymorphism in the (G. C. Ashton), 991
Protists : Nonulosaminic Acid (Sialic Acid) in (Dr. S. Aaronson and T. Lessie), 719
Proton and Neutron : Comparison of the Charges of the Electron, (A M. Hillas and T. E. Cranshaw), 459
Proton (Water) Line : Broadening of the, in High-Resolution Nuclear Magnetic Resonance Spectra of Starch Gels (Dr. Roger Collison and Dr M. P. McDonald), 548
Proton Magnetic Resonance in a Series of Dimethyl Siloxane Polymers—a Specific Long-Chain Effect ? (Dr J G. Powles and A. Hartland), 26
Protoplast-like Bodies of *Escherichia coli* : T_1 and λ Phage Adsorption on (Dr P. H. Hofschneider), 568
Provan, A L. : Milk Testing, *review*, 835
Proximal Centriole in Flagellate Spermatozoa : Position of the (Prof. Vishwa Nath, Brij L. Gupta and L. C. Mittal), 899 ; (Dr. J. Bronte Gatenby and R S Mathur), 900
Przibram, Prof. K : Do Meteorites exist consisting Predominantly of Feldspar ?, 300
Psaronius (Genus) . The Morphology and Anatomy of American Species of the (Jeanne Morgan), *review* by Prof John Walton, 190
Pseudomonas solanacearum : A Method for Characterizing (A. C. Hayward), 405
Psychiatric Services and Architecture (A. Baker, R Llewelyn Davies and P Sivadon), (United Nations, World Health Organization, Public Health Papers No. 1), 936
Psychiatry : Social Science, Criminology and, *review* by Prof. E. Stengel, 41
Psychiatry (Child Psychology and), and Allied Disciplines, Journal of, Vol. 1, No. 1, 935
Psychology of Gifted Children (Dr. W. D. Wall), 692
Psychology (Industrial), National Institute of : Vernon Prize for 1960 awarded to Dr R. B Buzzard, 938
Psychology and Psychiatry (Child), and Allied Disciplines, Journal of, Vol 1, No. 1, 935
Psychotomimetic Agent (New) : Blocking Effect of Tetrahydroaminacrin on a (Dr. Samuel Gershon), 1072
Public Health Authority (United States) : Grant of 152,517 dollars to the Department of Biomolecular Structure in the University of Leeds, 767
Public Health Service (United States) : Senior Research Fellowships, 439
Public Libraries (Manchester) : One hundred and seventh Annual Report (1958-59), 437
Public Welfare Medal of the United States National Academy of Sciences awarded to Dr Alan T. Waterman, 686
Publication : Microtexts as Media for (Hertfordshire County Council Technical Information Service), 602
Publications of Works in Scientific and other Fields of Learning : The Problem of Language in (Prof. D. Keilin), 912
Publications (Scientific Periodical) : Cost of (K. W. Humphreys and H. D. Barry), 124
Puchtler, Holde, and others . Structures corresponding to Terminal Bars and Terminal Web in Many Types of Cells, 784
Puck, Prof. T. T : Elected a member of the United States National Academy of Sciences, 773
Pugh, Dr A. C P. (Livingston, Prof. Robert, and) . Role of the Triplet State in the Photoreduction of Chlorophyll, 969

Pugh, Sir William : Elected to Fellowship of the Imperial College of Science and Technology, London, 522
Pulsatile Flow through Tapered Distensible Vessels, Reflexions, and the Hosie Phenomenon (Robert L Evans), 290
Pulsed Doppler Radar Meteorological Use of (J. R. Probert-Jones), 271
Pumphrey, Prof R J : Sensory Specialization in Response to Environmental Demands, 688
Punnett, S W. Title of senior lecturer in electronics in the University of Southampton conferred on, 284
Punsar, Sven, and others : Haemorrhagic Lipaemia in the Rat, 888
Pure Culture of the Trichomycete, *Amoebidium parasiticum* (Dr. Howard C. Whistler), 732
Pure Standard Metallic Perchlorate Solutions Preparation of (E. P. Serjeant), 963
Pure Substances : Paper Chromatography—Multiple Spot Formation by (Dr A H Beckett, M A. Beaven and Dr Ann E. Robinson), 775
Puri, Dr G S Appointed director of the Central Botanical Laboratory, Allahabad, 519 , work of, 519
Purification of a Specific Inducer of the Male Sex Organ in certain Fern Species (Ross B. Pringle, Ulrich Naf and Armin C Braun), 1066
Purification (Sewage), Institute of Annual Conference, 127, 938
Purification and Properties of Cauliflower Mosaic Virus (Prof Thomas P. Pirone, Glenn S. Pound and Robert J. Shepherd), 656
Purified Mouse Encephalomyocarditis Virus Particles Crystallization of (P Faulkner, E M Martin, S. Sved and Dr T. S. Work), 908
Purine Riboside (New), isolated from *Fusarium* Species : Characterization of a (Dr Alessandro Ballio, Dr Carlo Delfini and Dr Serena Russi), 968
Purnell, Dr J H . Gas Chromatography (Modification of Solid Supports), 943
Purposes (The Social), of Education (K G Collier), *review* by Prof H. L. Elvin, 420
Pye, *Sir* David . *Obituary* by Sir Ben Lockspeiser, 433
Pye, Ltd., W. G. (Cambridge) Scientific Instrument Catalogue 'N', 852
Pyramidone : Application of, to Detection of Nitrous Acid (Dr. Wiktor Wawrzyczek), 883
Pyrene Dimer Radiative Life-time of the, and the Possible Role of Excited Dimers in Energy Transfer Processes (Dr B Stevens and E. Hutton), 1045
Pyrolytic Graphite : Tensile Behaviour of, at 2,750°C. (H E Martens and W V Kotlensky), 960
Pyrophosphatase Activity in Reticulocytes Glutathione Stability and—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells (Prof S Rapoport and D Scheuch), 967
Pyrrolizidine Alkaloids : Detection of N-Oxides of the (A. T Dann), 1051

QUADRUPOLE Moment (Molecular), of Nitric Oxide (Dr D V G L. Narasimha Rao), 881
Quagliariello, E , and others : Interrelation of Tryptophan and Nicotinic Acid in Man during the First Month of Life, 639
Qualitative Analysis of Volatile Mercaptan Mixtures A Rapid Method for (John F Carson, William J Weston and Jack W. Ralls), 801
Quantique : Mécanique (Prof. Albert Messiah), *review* by Prof. N Kemmer, 999
Quantitative Aspects of Cytochemical Reactions : A New Technique for Studying the, and its Application to the Feulgen Reaction (P. van Duijn and J -P. Persijn), 805
Quantitative Biology Cold Spring Harbor Symposia on, Vol 23, Exchange of Genetic Material—Mechanisms and Consequences, *review* by Prof Kenneth Mather, 832
Quantitative Cytochemical Observations on a Specific Nucleoprotein Reaction in Cell Nuclei (Dr. E A. Barnard), 447
Quantitative Tissue Culture : Effect of Supernatant Potassium-Level on Cardiac Activity in (Prof. A. W B Cunningham, K. Kleutch and W. Herbst), 241
Quantities of Fission Products likely to be found in Milk in the Event of Aerial Contamination of Agricultural Land : An Assessment of the (Dr R J Garner), 1063
Quantum Effects on a Macroscopic Scale, *review* by Dr J. G. Valatin, 345
Quantum Electrodynamics Principles of (Walter E Thirring), translated from the German by J Bernstein, *review* by Prof N. Kemmer, 999
Quantum Theory for the Scholar, *review* by Prof. N Kemmer, 999
Quarter Century in the Natural Sciences (Dr Warren Weaver), 20
Queen, H M. the . To open the tercentenary celebrations of the Royal Society, 206
  Birthday Honours List, 933
Queen Elizabeth the Queen Mother, H M To open the Brunswick Square building of the School of Pharmacy, University of London, 284
Queen Mary College, London : Appointment of Dr B. C. L Weedon to the University of London chair of organic chemistry 522, 762
  Appointment of Prof. M J. S. Dewar to the chair of organic chemistry in the University of Chicago, 762
Queen's College, St. Andrews : Appointment of Dr. Ann R Sanderson as senior lecturer in the Department of Zoology, 767
Queen's University, Belfast Appointment of Dr S M Nelson as lecturer in organic chemistry, 767
  Appointment of Dr. A. R. Johnston as lecturer in physics, 767
  Appointment of Dr L. T. Threadgold as lecturer in zoology, 767
  Appointment of T. J. Black and D McCloy as lecturers in mechanical engineering, 767
Querido, A., and others : A New Class of Hormonally Active Steroids, 168
4-Quinazolone Acetylation of (R. Mirza), 716

RABBIT Antiglobin Serum : Observations on Globin, Haemoglobin and Haptoglobin using a (D. S. Rowe and J F Soothill), 975
Rabbits Blood Groups in (Dr D Nelken, Debora Birnbaum and J. Gurevitch), 321
  Cirrhosis of the Liver induced in, by Gastric Instillation of 3-Monohydroxycholanic Acid (Dr. Paul Holsti), 250
  Elevation of Serum Haptoglobin in, in Response to Experimental Inflammation (R K Murray and G E Connell), 86
Rabies Virus : An Indicator Plaque-forming System for Demonstration of Interference by Non-cytocidal Strains of (Dr. Martin M. Kaplan, Dr. Eberhard Wecker, Dr Zlatko Forsek and Dr. Hilary Koprowski), 821
Rabinovitch, Dr. M , and others : Increase in 'Alkaline' Ribonuclease of Rat Kidney Cortex after Lysozyme and Egg-White Administration, 158
Race, Dr R R , and others : An Rh Antibody Specific for V and R'^{s}, 171
  M_1, a Subdivision of the Human Blood-Group Antigen M, 642
Rackham, Thomas . Astronomical Photography at the Telescope, *review* by D. H P Jones, 190
Radar (Pulsed Doppler) . Meteorological Use of (J R Probert-Jones), 271
Radar Reflector : Roughness of the Moon as a (V. A. Hughes), 873
Radar 'Ring Angels' and the Roosting Movements of Starlings (E. Eastwood, G. A. Isted and G C Rider), 112
Radden, Dr B G A Specific Stain for Mast Cell Granules, 400
Radha, Dr K. (Nair, U K., and) Recent Advances in Coconut Research in India, 861
Radiation Effects of, on Human Heredity, 125
  Technological Use of (Australian Atomic Energy Commission Conference on), 126
Radiation of a Dry Enzyme : A Connexion between S–S Bond Breakage and Inactivation by (Dilip K Ray, Dr. Franklin Hutchinson and H J Morowitz), 312
Radiation Biology (Australasian Conference on), 938
Radiation Labelling with Carbon-14 of Aliphatic Hydrocarbons (Fulvio Cacace and Angelo Guarino), 632
Radiation (Apparent Radio), at 11-m Wave-Length from Venus (Dr. J. D. Kraus), 462
Radiation (Electromagnetic) . Coherence Properties of (United States Air Force, the Optical Society of America and the University of Rochester Conference on), 127
Radiation (Electromagnetic), from Cylindrical Structures (James R. Wait), *review* by W. Brown, 583
Radiation (Infra-red), over the United States : A Synoptic Study of (Dr John L. Gergen and Dr. William F Huch), 426, *erratum*, 604
Radiation (Intrinsic Recombination), in Diamond (J C. Male and J. R. Prior), 1037
Radiation (Ionizing) : Chemical Effects of, on Deoxyribonucleic Acid in Dilute Aqueous Solution (G Hems), 710
  Effect of Oxygen on the Inactivation of Trypsin by (Prof J. A V. Butler and Dr. A B. Robins), 697
  Inability of Thiotaurine to protect Mice against (Dr. D Cavallini and L Tentori), 254
  Significance of the 'Equivalent Redox Potential' in Aqueous Solutions under (Dr G H. Cartledge), 370
  Use of, in Spot Tests for Nitrogenous Compounds (H. J. M Bowen, E Arter and P. A. Cawse), 383
Radiation (Solar Extreme Ultra-violet), as a Source of Interplanetary Ionization (Dr Hans E. Hinteregger), 523
Radiation (Ultra-violet) Polymerization of Crystalline Methacrylic Acid initiated by (Dr C. H Bamford, A D Jenkins and J. C Ward), 713
Radiation, Genes and Man (Prof Bruce Wallace and Prof. Th. Dobzhansky), *review* by Dr. A. G. Searle, 109
Radiation Chemistry : Applied, *review* by Prof F. S. Dainton, 344
Radiation Effect : Mechanism of the, on the Synthesis of Deoxyribonucleic Acid (Dr. R J. Berry, E. Hell, Dr L G. Lajtha and Dr. M. Ebert), 563
Radiation Hazards : Genetic, *review* by Dr. A G Searle, 109
Radiation Impedance (Total Acoustic), of Rigid Pistons in an Array : Measurements of the (J S M Rusby), 144
Radiation Synthesis of Urea (S. Dilli and J H. Green), 383
Radiation-induced Changes in α-Lead Azide (G Todd and E. Parry), 543
Radiation-induced Cross-linking in Hydrocarbon Polymers . Mode of (T F. Williams,) 544
Radiations (Ionizing), on Water Primary Processes in the Action of—Formation and Reactivity of Self-trapped Electrons ('Polarons'), (Prof Joseph Weiss), 751
Radiations (Nuclear) Stimulating Effects of, on Development and Productivity of Rice Plants (Dr. Maung Mya Thaung), 982
Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in Energy Transfer Processes (Dr B. Stevens and E. Hutton), 1045
Radical (Benzyloxyl Free), in Solution Disproportionation and Dimerization of the (Dr. J. B. de Sousa and S. K Ho), 776
Radical (Free-) Reactions : A Model to account for the Production of Vibrationally Hot Molecules in (Dr. J. P Simons), 561
Radicals (Diatomic), containing Boron or Silicon : Absorption Spectra of (Dr B A. Thrush), 1044
Radicals (Free), from Solids . The Tesla-coil Method for producing (Dr. C. H Bamford, A. D Jenkins and J. C. Ward), 712
Radio Astronomy An Easy Guide to, *review* by Dr J S. Hey, 59
Radio Emission (Solar), and Polar Cap Absorption of Cosmic Noise : A Relation between (Dr M. R. Kundu and Prof F. T Haddock), 610
Radio Noise (Atmospheric) : Observations of (G. R. A. Ellis), 229
Radio Radiation (Apparent), at 11-m. Wave-Length from Venus (Dr. J. D. Kraus), 462
Radio Research in Britain, 357
Radio Research Station, Slough : Appointment of Dr J. A. Saxton as deputy director, 357
Radio Signals from Artificial Satellites : Electron Density Measurements in the Upper Ionosphere using the Faraday Rotation of (Dr D. McL. A. Wilson), 623
Radio Studies of the Universe (Dr R. D. Davies and Dr. H P. Palmer), *review* by Dr J. S Hey, 59
Radio Telescope at Jodrell Bank : Cost of the, 13
Radioactive Counting : An Inexpensive Castle and Sample Holder for (Dr. Howard Boroughs), 145
Radioactive Fallout during 1959 (W. Anderson, R. E. Bentley, L. K. Burton, J. O. Crookall and C A Greatorex), 925
Radioactive 7-Iodo-6-Deoxytetracycline in Tumour Tissue (Dr Joseph J. Hlavka and Donald A. Buyske), 1064
Radioactive Isotope Technique Estimation of Mouse Tumour Blood Volumes employing a (F. S Stewart and Dr. A E G Pearson), 250
Radioactivity of the Atmosphere due to Distant Nuclear Test Explosions (D H Peirson, R N. Crooks and E. M. R Fisher), 224

Radioactivity (Fall-out), in Southern Sweden (Prof Pontus Ljunggren), 655
Radioactivity (Long-lived Natural): Use of, as an Atmospheric Tracer (W. M. Burton and N G. Stewart), 584
Radioassay by Gas Chromatography of Compounds labelled with Carbon-14 (Dr. Arthur Karmen and Harold R. Tritch), 150
Radiobiology: The Sigmoid Survival Curve in (Dr. Tikvah Alper, Dr. N. E. Gillies and Dr. M M. Elkind), 1062
Radiocaesium and Potassium-40 in Norwegian-produced Milk (K. Madshus and J. Baarli), 527
Radiocarbon Dating System using Scintillation Techniques (C. F. G. Delaney and I. R. McAulay), 204
Radiochemistry of Arsenic (Harold C Beard), 602
Radiochemistry of Cadmium (James R. DeVoe), 602
Radiochemistry of Francium (Earl J Hyde), 602
Radioiodine Uptake Measurement: Thyroid (Dr. Marshall Brucer), *review* by Dr E. E Pochin, 424
Radioisotopes: International Directory of, Vol. 1, Unprocessed and Processed Radioactive Preparations and Special Radiation Sources; Vol. 2, Compounds of Carbon-14, Hydrogen-3, Iodine-131, Phosphorus-32 and Sulphur-35 (International Atomic Energy Agency), 282
Radioisotopes in the Physical Sciences and Industry: Use of (International Atomic Energy Agency Conference on), 284
Radiologie (Medizinische) Sechzig Jahre (Prof Hans R. Schinz), *review* by Dr. R E. Steiner, 921
Radiosensitivity of Bacteriophage in the Presence of Sulphydryl Compounds: Effect of Oxygen on the (Dr. P. Howard-Flanders), 485
Radiosensitivity of Human Cells in Tissue Culture Effect of Oxygen and Nitric Oxide on the (Dr. D. L Dewey), 780
Radnor, Lord: Appointed a Knight of the Order of the Garter, 361
Radzimski, Dr. Gerald (Pressman, Dr. David, and): Iodination of Specific Sites on Bovine Serum Albumin, 1049
Rae, Dr. E. R: Physics and Mathematics, *review*, 68
Raffel, Sidney, and others (edited by) · Annual Review of Microbiology, Vol. 13, *review* by Dr. B. A. Newton, 49
Ragatz, Prof. Roland A, and others: Chemical Process Principles, Part 2, Thermodynamics, second edition, *review* by L. E. Marc de Chazal, 1003
Rain-Water: Sodium/Potassium Ratio in (Dr. A. T. Wilson), 705
Raine, H. C. · Polymeric Progress (Polyolefins), 442
Rainfall: Surface Temperature of Swedish Lakes and the Origin of (Vilhelm Irgens Pettersson), 945
Ralls, Jack W., and others · A Rapid Method for Qualitative Analysis of Volatile Mercaptan Mixtures, 801
Ramachandran, C. P. · Recent Advances in Coconut Research in India, 862
Ramanandan, P L.: Recent Advances in Coconut Research in India, 861
Ramer, J. D. Bibliography on Plasma Physics and Magnetohydrodynamics and their Applications to Controlled Thermonuclear Reactions, 522
Rana temporaria · Endocrine Control of Sexual Reproduction in *Opalina ranarum* Parasitic in (Dr M. El Mofty and Prof. J D Smyth), 559
Randall, H. M., and others · Mycosides, a New Class of Type-Specific Glycolipids of *Mycobacteria*, 887
Range (Home), in a Feral Goat Herd (Thane Riney and Graeme Caughley), 125
Rannoch Moor Nature Reserve: Additions to the, 358
Rao, C. Seshagiri: Recent Advances in Coconut Research in India, 861
Rao, K. R. Mohan · Recent Advances in Coconut Research in India, 861
Rao, T. Kailas, and Rao, T. Srirama: Recent Advances in Coconut Research in India, 860
Rao, T. Srirama (Rao, T. Kailas, and): Recent Advances in Coconut Research in India, 860
Rapid Method for Qualitative Analysis of Volatile Mercaptan Mixtures (John F. Carson, William J Weston and Jack W. Ralls), 801
Rapid Volume Changes in a Muscle during Activity Determination of Small (Prof. B. C. Abbott and R. J. Baskin), 1055
Rapoport, Prof. S., and Scheuch, D.: Glutathione Stability and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells, 967
Rare-Earth Elements, Lanthanum to Lutetium, in Chondritic Meteorites: Abundances of the (Dr. R. S. Schmitt, A. W Mosen, C. S. Suffredini, J. E. Lasch, Dr. R. A. Sharp and D. A. Olehy), 863
Rat: Effect of Severing the Olfactory Bulbs on the Intake and Excretion of Water in the (V. Nováková and H. Dlouhá), 638
  Effect of Thyroxine and 2,4-Dinitrophenol on Levels of Ubiquinone and Ubichromenol in the (E. E. Edwin, J. Green, A. T. Diplock and J Bunyan), 725
  Exploratory Behaviour in the (Roger G. A. Stretch), 454
  Haemorrhagic Lipaemia in the (Sven Punsar, Gottfried Hartel, Antti Louhija and Olli P. Heinonen), 888
  Induction of a Chorion-epitheliomatous Tumour in the (R. Stein-Werblowsky), 980
  Œstrogen–Insulin Interaction on the Uterus of the (Dr. R. Michel Zilberstein), 635
  Ubiquinones and Ubichromenols in the (A. T. Diplock, E. E. Edwin, J. Green, J. Bunyan and S. Marcinkiewicz), 554
  Whole-Body Turnover of Selenium in the (Clifton Blincoe), 398
Rat (Adult): Histophotometrical Study of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the (S. L. Liu), 475
Rat (Adult), inoculated after Birth with Rous Sarcoma Tissue: Presence of Chicken Tumour Virus in the Sarcoma of the (Dr. Jan Svoboda), 980
Rat Atria: Intracellular Potentials in, during and after Vagal Stimulation or Acetylcholine Administration (P. A. Biersteker, J. Th. F. Boeles and L. N Bouman), 637
Rat Diaphragm: Release of Acetylcholine in (K. Krnjević and J F. Mitchell), 241
Rat Diaphragm (Isolated): Accumulation of Substrate by—a Possible Mechanism for the Anti-Inflammatory Action of Corticosteroids (Prof. Ira G. Wool), 728
Rat Embryos (Triploid), and other Chromosomal Deviants after Colchicine Treatment and Polyspermy (L. Piko and O. Bomsel-Helmreich), 737
Rat Kidney: Development of 5-Hydroxytryptophan Decarboxylase Activity in (Dr. Irene Huang, Sheila Tannenbaum and Dr. David Yi-Yung Hsia), 717
Rat Kidney Cortex · Increase in 'Alkaline' Ribonuclease of, after Lysozyme and Egg-White Administration (Dr. T. Maack, Dr. R Brentani and Dr. M. Rabinovitch), 158
Rat Liver: Binding of a Hepatocarcinogen to the Structural Lipoprotein of—Its Bearing on the Immunological Theory of Cancer (J. W. Westrop and Prof. H. N. Green), 350
  Level of Sulphydryl Compounds in, following Feeding with Goitrogenous and Non-goitrogenous Cabbage (Jozef Sedlák), 892
Rat Liver in Experimental Cirrhosis: Histochemical and Biochemical Studies of, after Partial Hepatectomy (I. Bartók, Gy. Domján, E. Horváth and Prof. B. Korpássy), 397
Rat Liver Mitochondria: Effect of Pituitary Growth Hormone *in vivo* on the Phosphorus/Oxygen Ratios of Isolated (C. N. Graymore, A H Melhuish and A. L. Greenbaum), 392
  Effects of Fatty Acids on the ^{32}P-Adenosine Triphosphate Exchange Reaction in (K Ahmed and Dr. P. G Scholefield), 1046
Rat Muscle *in vitro* · Effect of Denervation on Potassium-42 Uptake by the (Dr. Z. Drahota and O Hudlická), 396
Rat Pineal Parenchymal Cells. Effects of Injection of Bovine Pineal Extract on the Nuclei of (Dr. Uno Holmgren, Dr. Mark D. Altschule and Dr Richard J. Wurtman), 393
Rat's Brain. Effect of Methylpentynol on Acetylcholine in the (Giancarlo Pepeu and Prof Nicholas J. Giarman), 638
Rate of Increase in Environmental Temperature · Oxygen Consumption in Cattle in relation to (Prof. H. H Kibler), 972
Rate of Ligand Exchange with its Metal Complex by a Polarimetric Method (B Bosnich, Dr. F. P. Dwyer and Dr A. M Sargeson), 966
Rates (Clearance), of Sodium-24, Potassium-42 and Iodine-131 in Normal Dog Hip Joints (Prof. Patrick G. Laing and Dr. Ik Dong Kim), 898
Ratio (Sex-): Evolutionary Origin of Sexual Differentiation and the (Dr. H Kalmus and Dr. C. A B Smith), 1004
Ratio (Sex), of Ammocoetes (M. W. Hardisty), 988
Ratio (Sex) at Birth Dependence of the, on the Age of the Father (Dr. Leo Szilard), 649; (Dr. A. Comfort), 1065
Ratio (Sex), in *Drosophila*: Homeostasis of the (Dr. P A Parsons), 411
Ratio (Sodium/Potassium), in Rain-Water (Dr. A. T. Wilson), 705
Ratios (Saliva–Serum), of Tritium after the Administration of Tritiated Water (Dr. A J. Coppen and Dr. J L. Gibbons), 724
Rats · Effect of Manganese Edetate on Blood Formation in (T J. Sullivan), 87
  Effect of Vitamin A on the Cystine Content in Skin of (Prof. Tatsuo Koyanagi and Satoru Odagiri), 809
Rats receiving an Acute Whole-Body Dose of X-Rays: Yeast Ribonucleic Acid and its Nucleotides as Recovery Factors in (Prof J. Maisin, P Dumont and A. Dunjic), 487
Rats during Irradiation: Significance of Adrenals for Increased Oxygen Consumption in (Dr. A. Vacek), 90
Rats exposed to X-Rays: Inability of Methionine to affect Lethality in Mice and (Prof. Zenon M Bacq and Dr. Marie L Beaumariage), 1064
Rats (Lathyritic): Aortic, Serum, Connective Tissue and Osseous Chemistry in (Dr. R. A Grant, M. Hathorn and Prof. Theodore Gillman), 164
Rats and Chicks · Vitamin A Isomers in the Liver of (O R. Braekkan, H Myklestad, L. R. Njaa and F Utne), 312
Rawlins, F. I. G.. Godel's Theorem, *review*, 61
  The Study of Man, *review*, 347
  Scientific Methods in the Care of Works of Art, 437
  The Reach of Science, *review*, 1003
Rawther, T S. S: Recent Advances in Coconut Research in India, 861
Ray, Dilik K, and others: A Connexion between S–S Bond Breakage and Inactivation by Radiation of a Dry Enzyme, 312
Ray, Prof. Ramesh Chandra. *Obituary*, 679
γ-Ray Resonance (Ultra-High Resolution), in Zinc-67 (D. E. Nagle, P. P. Craig and W. E Keller), 707
Rayon Research Association, British: Open Days, 284
Rays (Ionizing): Combined Application of Hydrogen Peroxide and, in Animal Experiments (E. Fleischmann, H. Werkgartner and K. Karrer), 324
Reach of Science (Prof. Henryk Mehlberg), *review* by F. I G. Rawlins, 1003
Reaction of Active Nitrogen with Polyethylene (Dr. J. L Weininger), 546
Reaction between Copper and Solid Oxygen condensed at Very Low Temperatures from a Gas Discharge (Jerome Kruger and William J. Ambs), 794
Reaction of *p-n*-Decyloxybenzenediazonium Fluoborate with Sodium Iodide in Benzene (Prof W. Bradley and J. D Thompson), 631
Reaction of Transition Metal Ions with Ethylenediamine · Heats and Entropies of (M. Ciampolini, P. Paoletti and Prof. L. Sacconi), 880
Reaction (Antiglobulin): Role of C'_4 in the (G. C. Jenkins, Margaret J. Polley and Dr. P. L Mollison), 482
Reaction (Autoxidation): A New Type of—Cause of the Instability of Cytochrome c Reductase (Dr. Malcolm Dixon, J. M. Maynard and P. F. W. Morrow), 1032; Flavin Dissociation and Inactivation of Cytochrome b_5 by Oxygen (J. McD. Armstrong, Dr. J H. Coates and Prof. R. K. Morton), 1033
Reaction (Feulgen). A New Technique for Studying the Quantitative Aspects of Cytochemical Reactions and its Application to the (P. van Duijn and J.-P. Persijn), 805
Reaction (Graft versus Host), in Parabiotic Disease (Dr. B. Nakič, Z. Nakič and V. Silobrčič), 322
Reaction (Malonaldehyde–Thiobarbituric Acid): Estimation of 3-Deoxy Sugars by means of the (Dr. Morris A. Cynkin and Dr. Gilbert Ashwell), 155
Reaction (^{32}P-Adenosine Triphosphate Exchange), in Rat Liver Mitochondria: Effects of Fatty Acids on the (K. Ahmed and Dr. P. G. Scholefield), 1046
Reaction (Specific Nucleoprotein), in Cell Nuclei: Quantitative Cytochemical Observations on a (Dr. E. A. Barnard), 447
Reactions: Structure of Graphite and the Kinetics of its (Société de Chimie Physique Conference on), 284
Reactions (Bacterially Mediated False-Positive), in Lytic Blood-Typing Tests (Prof Clyde Stormont, Yoshiko Suzuki and W. J Miller), 247
Reactions (Controlled Thermonuclear): Bibliography on Plasma Physics and Magnetohydrodynamics and their Applications to (J. D. Ramer), 522
Reactions (Cytochemical): A New Technique for Studying the Quantitative Aspects of, and its Application to the Feulgen Reaction (P. van Duijn and J.-P. Persijn), 805

Reactions (Electron Transfer), involving *s*-Trinitrobenzene (Dr. R. E. Miller and Prof W. F. K. Wynne-Jones), 149
Reactions (Free-Radical) : A Model to account for the Production of Vibrationally Hot Molecules in (Dr. J. P. Simons), 551
Reactions (Microbiological) Steric Course of (edited by G E. W. Wolstenholme and Cecilia M. O'Connor), *review* by Prof D. C. Harrison, 835
Reactions (Non-Enzymic), of Indoles with Coenzyme I (Prof. S. G A. Alivisatos, G A Mourkides and A Jibril), 718
Reactions (Peroxide) : Mechanisms of (Office of Ordnance Research of the United States Army and Brown University Conference on), 127
Reactivation of Poxviruses by a Non-Genetic Mechanism (Dr. W K Joklik, Pamela Abel and I H. Holmes), 992
'Reactive Inhibition' (Construct), in the Interpretation of Age Changes in Performance (Dr. S. Griew and Dr. R. Lynn), 182
Reactivity of Self-trapped Electrons ('Polarons') . Primary Processes in the Action of Ionizing Radiations on Water—Formation and (Prof. Joseph Weiss), 751
Reactor Fuel Element Technology (Imperial College of Science and Technology Course of Lectures in), 1025
Reactor Physics : Nuclear (Prof. Raymond L Murray), *review* by J Fell, 68
Reactor Shielding : Fundamental Aspects of (Dr. Herbert Goldstein), *review* by Dr. T E Allibone, 917
Reactors (Nuclear Energy and Power) . Fundamentals of (Henry Jacobowitz), *review* by Dr T. E Allibone, 917
Read, Prof. H H : Awarded the Steinmann Medal of the Deutsche Geologische Vereinigung, 206, 690
Read, Prof John : Organic Syntheses, *review*, 669
Reading, H W., and others Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methylisothiazole), a New Antibacterial Sulphonamide, 221
Reagent (Thiobarbituric Acid Spray), for Deoxy Sugars and Sialic Acids (Dr Leonard Warren), 237
Reagents (Alkylating) : Non-Protein Sulphydryl Group in the Original Strain and Sub-line of the Ascites Tumour resistant to (Iwao Hirono), 1059
Reaktionen (Chemische), Ionisierender Strahlen (Radiation Chemistry), (herausgegeben von Prof. Hermann Mohler), *review* by Prof F. S. Dainton, 344
Recently Produced Fission Products in the Atmosphere : Detection of (Dr. W. Anderson, Dr. R. E Bentley, L. K Burton and Dr. C. A. Greatorex), 223
Receptors (Muscle), in the Kitten : Activity of (Dr. Sten Skoglund), 478
Recombination Genetic, *review* by Prof Kenneth Mather, 832
Recombination Radiation (Intrinsic), in Diamond (J C. Male and J. R. Prior), 1037
Reconnaissance (Geological), of the Sor-Rondane Mountains (Queen Maud Land), (Prof E. E. Picciotto), 740
Reconstruction of the Foot of the 'Abominable Snowman' (W. Tschernezky), 496
Record Low Sea-Level Air Pressure : New (C L. Jordan), 283
Recording Extracellular Unit Action Potentials from the Central Nervous System : 'Weightless' Micro-electrodes for (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Recording Material for X-Ray Microscopy . Silver-activated Nitrocellulose as (Saara K. Asunmaa), 1036
Recourt, J. H. (Beerthuis, R. K., and) : Sterol Analysis by Gas Chromatography, 372
Recovery of Adult *Amoeba lescherae* from Dried Cultures (Monica Taylor), 329
Recovery of Ultra-violet-Irradiated *Escherichia coli B* Effects of Chloramphenicol on the (H. Okagaki and Prof. A. Sibatani), 818
Recovery Factors in Rats receiving an Acute Whole-Body Dose of X-Rays : Yeast Ribonucleic Acid and its Nucleotides as (Prof. J. Maisin, P. Dumont and A. Dunjic), 487
Recruitment of Teachers in Britain, 600
Red, Roe and Fallow, *review* by R. S. R. Fitter, 45
Red Blood Cells of East Africans : Glucose-6-Phosphate Dehydrogenase Deficiency in (Dr. A C. Allison), 531
Red Sea : Sediment Cores from the Mediterranean Sea and the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, No. 1), 609
Red Spider Mite, *Tetranychus telarius* (L.) (Acarina:Tetranychidae) : Effect of Relative Humidity on Hatching and on Toxicity of Ovicides to Eggs of the (R. A. Harrison and A. G Smith), 409
Red Water Bloom of Rotifers in Cook Strait, New Zealand (Vivienne Cassie), 328
Reder, Friedrich H , and Winkler, Gernot M. R. : Preliminary Flight Tests of an Atomic Clock in Preparation of Long-range Synchronization Experiments, 592
Redistribution (Inter-bivalent), of Chiasmata in *Delphinium* : Experimentally Induced (H K. Jain and A. K. Bose), 260
Redman, Prof. R. O. : *Obituary* of Dr. Andrew McKellar, 1014
Redmond, Dr. J. P., and Walker, jun., Dr. P. L : Gas Content of Graphites, 72
Redox Potential' ('Equivalent) : Significance of the, in Aqueous Solutions under Ionizing Radiation (Dr. G. H. Cartledge), 370
Redpoll in New Zealand—Interbreeding Sub-species (David Stenhouse), 488
Reduced Temperatures for Nucleation in Supercooled Liquids (Dr. E. R. Buckle), 875
Reductase (Cytochrome *c*) : Cause of the Instability of (A New Type of Autoxidation Reaction), (Dr. Malcolm Dixon, J. M. Maynard and P. F. W. Morrow), 1032
Reduction of Metal Ions by Hydrogen Atoms : Mechanism of the Oxidation and (Prof. J. Halpern, G. Czapski, J. Jortner and Dr. G. Stein), 629
Reerink, Dr. E. H., and others : A New Class of Hormonally Active Steroids, 168
Rees, Dr. K. R. (Dawkins, M. J. R., and) : A Biochemical Approach to Pathology, *review* by Dr. R. W. R Baker, 921
Rees, Dr. Linford : Treatment of Depression by Drugs and other Means, 114
Re-Evaluation of the Clotting Time of Chicken Blood (Dr. C. H. Bigland and Dr. D. C. Triantophyllopoulos), 644
Reeve, P. (Hurst, Dr. E. Weston, and) : Transmission of the Viruses of Trachoma, Inclusion Blennorrhoea and Lymphogranuloma to Mice, 336
Reeves, Dr. C. M : Appointed lecturer in electronic computing at the University of Leeds, 767
Reference Books on Mineralogy in the U S.S.R. (Academy of Sciences of the U S.S R), 203
Reference Library (National), of Science and Invention, 934
Refinery Production (Consumption and), 1958 and 1959 : United Kingdom Petroleum Industry Statistics relating to (Petroleum Information Bureau), 851
Reflectance of Coal Vitrains in the Visible and Ultra-Violet compared with that of Graphite (L. A. Gilbert), 143
Reflector (Radar) . Roughness of the Moon as a (V A Hughes), 873
Reflex (Giant-Fibre), of the Earthworm (Dr. M. B. V. Roberts), 167
Reflexions, and the Hosie Phenomenon : Pulsatile Flow through Tapered Distensible Vessels, (Robert L. Evans), 290
Regelson, Dr. William, and others : Synthetic Polyelectrolytes as Tumour Inhibitors, 778
Regenerating Muscles (Injured and) : Treatment of, with Plant Extracts (S. Hoja and J. Vittek), 283
Regeneration of Visual Pigments from their Low-Temperature Photoproducts (Dr. C. D. B Bridges), 292
Region (The Mesopause), of the Ionosphere (Dr. J. D Whitehead), 461
Regional Council for Further Education (Southern) : Twelfth Annual Report, 123
Registrar General : Statistical Review, Part 2, Tables, Population, 765
Regular Micropulsations of the Earth's Field at the Equator (Rosemary Hutton), 955
Regular Mixed-Layer Chlorite–Vermiculite Mineral (Dr. M Nakahira and S. Sugiura), 877
Regularities in the Retina and Optic Lobes of *Octopus* in relation to Form Discrimination (The Visual System of *Octopus*), (Prof. J. Z. Young), 836
Regulation (Self-) for Children, *review* by Prof. M. D Vernon, 38, 912 ; (Paul Ritter), 911
Regulator : The Brain as (Dr. W. Ross Ashby), 413
Reichenbach, Hans : Modern Philosophy of Science (translated and edited by Maria Reichenbach), *review* by Prof Herbert Dingle, 503
Reid, K. J : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Reisenauer, Prof H. M : Cobalt in Nitrogen Fixation by a Legume, 375
Reiser, Prof Oliver L. : The Integration of Human Knowledge, *review* by Dr. John Tucker, 37
Relation between Solar Radio Emission and Polar Cap Absorption of Cosmic Noise (Dr. M. R. Kundu and Prof F. T. Haddock), 610
Relation (Possible), to the Circulation of Amniotic Fluid : Ultra-Structure of Human Amnion and its (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Relations (Thermodynamical), in Two-Component Two-Phase Systems (Prof. H. Kaufman), 299
Relationships : Solar Terrestrial (K. D. Cole), 874
Relationships to Human Anatomy : The Teaching of Veterinary Anatomy as a Branch of Biology—its (Dr. R. A. Green), 192
Relative Humidity : Effect of, on Hatching and on Toxicity of Ovicides to Eggs of the Red Spider Mite, *Tetranychus telarius* (L.) (Acarina : Tetranychidae), (R. A. Harrison and A G. Smith), 409
Relativity : Analysis of Accelerated Motion in the Theory of (Robert T. Jones), 790
Relativity (General) : Gravitational Waves in (Dr. H. Bondi), 535
Release of Acetylcholine in Rat Diaphragm (K. Krnjević and J. F. Mitchell), 241
Release of Methionine labelled with Sulphur-35 from Muscle Tissue and Mitochondria (Dr. R Zák and Dr Z. Drahota), 973
Release (Anaphylactic), of Histamine from Chopped Guinea Pig Lung : Inhibition of the, by Chymotrypsin Substrates and Inhibitors (Dr. K. F. Austen and Dr. W. E. Brocklehurst), 866
Release (Virus), from Single Cells of Mouse Parotid Tumours (Dr. Mathilde Krim and Dr Leo Sachs), 262
Remanent Magnetization (Natural), of some Welsh Slates : Anisotropy of Susceptibility and the (M D. Fuller), 791
Removal of Strontium from Milk (Dr. Leon Singer and Dr. W. D. Armstrong), 484
Renal Carcinomas : Ultrastructure of the Clear Cells in, and its Importance for the Demonstration of their Renal Origin (Prof. Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Renal Origin : Ultrastructure of the Clear Cells in Renal Carcinomas and its Importance for the Demonstration of their (Prof. Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Rendel, D. G. A : Promoted to Deputy Chief Scientific Officer and appointed head of the Mechanical Engineering Department of the Royal Aircraft Establishment, 12 ; work of, 12
Rendel, Jan, and others : Inheritance of β-Globulins in Serum and Milk from Cattle, 907
Rendel, Dr. J. M. : Elected a Fellow of the Australian Academy of Science, 519
Rensselaer Polytechnic Institute, Troy, N.Y. : Report on Gifts, Grants and Bequests (1958-59), 766
Repercussions (Human) : Automation and its, 364
Replica Method : Size Distribution of Tobacco Smoke Droplets by a (W. J. Harris), 537
Reproduction of Catalogue Cards (Philip S. Pargeter), 1020
Reproduction (Animal) : Ford Research Fellowships in (Zoological Society of London), 519
Reproduction (Sexual), in *Opalina ranarum* Parasitic in *Rana temporaria* : Endocrine Control of (Dr. M. El Mofty and Prof. J. D. Smyth), 559
Reptiles : Poisonous Amphibians and (Prof. Floyd Boys and Prof. Hobart M. Smith), *review* by A. G. C. Grandison, 269
Requirements for Stereospecificity in Hydrolysis by Chymotrypsin—Diethyl β-Acetamidoglutarate (Prof. Saul G. Cohen and Ezra Khedouri), 75
Research at the Imperial College of Science and Technology, London, 123
Research in British Universities, 1959 : The Use of Film in Teaching and (British Universities Film Council), 444

Research Management The Human Element in (Dr. B. E. Noltingk), *review* by E. S. Hiscocks, 579
Research Medal of the Royal Agricultural Society of England awarded to Prof R L Wain, 685
Research Personnel Management of, *review* by E S Hiscocks, 579
Research Programmes in Ageing (United States Department of Health), 852
Resemblance (Slight Structural), to Natural Bradykinin Bradykinin Activity of some Synthetic Peptides with only (Dr. G L Tritsch and Prof D. W Woolley), 76
Residential Short Courses (National Institute of Adult Education), 685
Resin (Sulphonated Polystyrene) Behaviour of some Aldehydes on a (Dr. S. A Barker, K. Murray and Prof M Stacey), 469
Resin Method (An Ion-Exchange), for the Fractionation of Alcoholic Plant Extracts (Dr Dalton Wang), 326
Resins (Ion Exchange) : Trace Analysis by X-Ray Fluorescence using (J N. van Niekerk and J F de Wet), 380
Resistance of the Adult Housefly (*Musca domestica*) to 'Cyclodiene' Insecticides : Mechanisms of (Dr G T Brooks), 96
Resistance to Dieldrin Genetics of, in *Lucilia cuprina* Wied. (G J. Shanahan), 181
Resistance to Disease (Crop Plant) Nature and Exploitation of (Association of Applied Biologists and the British Mycological Society Symposium on), 857
Resistance of Gonococcus Strains to Penicillin (Alice Reyn and M. W. Bentzon), 608
Resistance in Mice to Tumour Induction by *S E* Polyoma Virus : Development of (Sarah E. Stewart, Bernice E. Eddy, Marjean Irwin and Stephanie Lee), 615
Resistance (Enhanced), of Mice to Infection with *Pasteurella pestis* following Vaccination with Fractions of Phenol-killed Tubercle Bacilli (Prof. David W Weiss), 1060
Resistance (High-Order), to 'Dieldrin' in *Lucilia cuprina* Wied. : Selection for (G J Shanahan), 100
Resistant to Root-Knot Nematodes (*Meloidogyne* spp,) : Plants Recorded as (Mary T Franklin and D J Hooper), 684
Resolution of Human Haemoglobin Variants : A New Electrophoretic Medium and its Application to the (Dr. E R. Huehns and Dr. A. O. Jakubovic), 729
Resolution (Ultra-High) γ-Ray Resonance in Zinc-67 (D. E. Nagle, P. P. Craig and W. E. Keller), 707
Resonance · Nuclear Magnetic—Applications to Organic Chemistry (Prof. J D Roberts), *review* by Prof E R. Andrew, 55
Resonance (Electron Spin) : Study of the Oxidation of Hindered Phenols by (Dr J E. Bennett), 385
Resonance (Electron Spin), in Hydrogen Peroxide–Water Solutions at 90°K. Irradiated with Ultra-Violet Light (Robert C. Smith and S J. Wyatt), 226
Resonance (Nuclear Magnetic) Optical Detection of (J. Brossel), 440
Resonance (Proton Magnetic), in a Series of Dimethyl Siloxane Polymers—a Specific Long-Chain Effect ? (Dr J. G. Powles and A. Hartland), 26
Resonance (Ultra-High Resolution γ-Ray), in Zinc-67 (D. E. Nagle, P P. Craig and W. E. Keller), 707
Resonance Spectra (High-Resolution Nuclear Magnetic), of Starch Gels : Broadening of the Water Proton Line in (Dr. Roger Collison and Dr M P. McDonald), 548
Resources : Water, *review* by E. Miller, 423
Respiration and Growth of L-Strain Fibroblasts : Some Effects of Different Tensions of Oxygen on the (A. R Fisher), 315
Respiratory Dead Space of the Giraffe (Prof. Eugene D. Robin, Dr. Joseph M. Corson and Prof Gustave J. Dammin), 24
Response . The Brain in, *review* by Prof M. D. Vernon, 919
Response to Environmental Demands : Sensory Specialization in (Zoological Society of London Symposium on), 688
Response to Experimental Inflammation . Elevation of Serum Haptoglobin in Rabbits in (R. K. Murray and G. E. Connell), 86
Response of Larvae of *Calyptraea chinensis* (L) to Light (H. V. Wyatt), 328
Response (The Photoperiodic), of some Nigerian Plants (E. Njoku), 438
Responsiveness of the Neurosecretory System of Larval Lampreys (*Petromyzon marinus*) to Light (Dr Nezihe Oztan and Dr. Aubrey Gorbman), 167
Results of the Royal Society's International Geophysical Year Expedition (Royal Society Discussion on), 191
Retarded Development of *Ostertagia* Species in Sheep (J. D. Dunsmore), 986
Reticulo-Endothelial System : Duration of Stimulation of Phagocytic Activity of the, after Cessation of Treatment with Diethylstilboestrol (C C Ware and Prof. T. Nicol), 974
Reticulocytes · Glutathione Stability and Pyrophosphatase Activity in—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells (Prof. S. Rapoport and D Scheuch), 967
Retina and Optic Lobes of *Octopus* in relation to Form Discrimination : Regularities in the (The Visual System of *Octopus*), (Prof. J. Z. Young), 836
Reversible Nitrate Electrode (P H. T Beckett), 879
Reversible Transformation of Gelatin to the Collagen Structure (Dr. Arthur Veis and Dr. Jerome Cohen), 720
Reversion of *c*-Mutations . Induction and, by Irradiation of the Extracellular χ-Phage of *Serratia* (Prof. R. W. Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
Reversions induced by Base Analogues in *Salmonella typhimurium* (Rivka Rudner and Elias Balbinder), 180
Revolution : The Neolithic (Sonia Cole), 360
Revolution (October) Soviet Reviews of Nuclear Science on the 40th Anniversary of the, *review* by Dr. T. E. Allibone, 917
Reyers, I. H M , and others : Swelling of Fresh and Aged Liver Mitochondria as affected by Succinate, Adenine Nucleotides and Thyroxine, 556
Reyment, R. A. · A Note on the Foraminifera in a Sediment Core from the Mindanao Trough (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 6), 609
Reyn, Alice, and Bentzon, M. W. : Resistance of Gonococcus Strains to Penicillin, 608
Rh Antibody Specific for V and R's (Dr. Ruth Sanger, Jean Noades, Patricia Tippett, Dr R R Race J. A. Jack and Dr C A. Cunningham), 171

Rhenium : Some New Complexes of (R Colton, R. Levitus and Prof. G. Wilkinson), 233
Rheological Properties of Barytes Suspensions (A W. Earnshaw and J. C. Sproson), 378
Rheological Properties of Dough made from Wheaten Flour : A Role for Thiol and Disulphide Groups in Determining the (R. Frater, Dr. F. J. R Hird, H. J. Moss and J R. Yates), 451
Rheology in Australia (Dr P. U. A. Grossman), 941
Rhesus Monkey Development of Learning in the (Harry F. Harlow and colleagues), 211
  Diurnal Temperature Variation in the, under Normal and Experimental Conditions (Dr. Lloyd B. Erikson), 83
Rhodesia and Nyasaland (Federation of) : Government Organizations and Statutory Bodies concerned with Scientific Research and Technical Services in the, 202
Rhythm (Biological), Society for, and the International Basimetric Society : Seventh International Conference, 604
Riboflavin Antimetabolite ? : Ackee Toxin, a (H. C. Fox and D. S Miller), 561
Ribonuclease ('Alkaline'), of Rat Kidney Cortex Increase in, after Lysozyme and Egg-White Administration (Dr T. Maack, Dr R Brentani and Dr M. Rabinovitch), 158
Ribonucleic Acid of *Anacystis nidulans* : A Methyl Cytidine from the (Dr. B. B Biswas and J. Myers), 238
Ribonucleic Acid (Tumour) Heterogeneity of, and the Effect of 'Degranol' on it (F. Antoni, E J. Hidvégi and K Lapis), 81
Ribonucleic Acid (Yeast), and its Nucleotides as Recovery Factors in Rats receiving an Acute Whole-Body Dose of X-Rays (Prof. J. Maisin, P. Dumont and A Dunjic), 487
Ribonucleic Acids in Animal Cells Fractionation of Two Metabolically Distinct Classes of, and its Bearings on Cancer (Prof. A. Sibatani, K. Yamana, K. Kimura and T. Takahashi), 215
Ribonucleic Acids and the Synthesis of Cellular Proteins (Prof. J. Brachet), 194
Riboside (Purine), isolated from *Fusarium* Species . Characterization of a New (Dr Alessandro Ballio, Dr. Carlo Delfini and Dr Serena Russi), 968
Rice (D H. Girst), third edition, *review* by Dr H. Greene, 507
Rice Plants . Stimulating Effects of Nuclear Radiations on Development and Productivity of (Dr Maung Mya Thaung), 982
Rice Production · Paddy Soils and (Dr. H Greene), 511

Scientific Journals : International Communications and, 358
Scientific Men . Movements of, 763
Scientific Methods in the Care of Works of Art (F. I G. Rawlins), 437
Scientific Periodical Publications : Cost of (K. W. Humphreys and H D. Barry), 124
Scientific Problems of Crop Protection (Hungarian Academy of Sciences International Conference on), 523
Scientific Publications Council : Discussion on the Rapid Increase in the number of New Scientific Journals, 18
Scientific Research in Antarctica, 212
Scientific Research in the Overseas Territories of the British Commonwealth, 501
Scientific Research at South African Universities, 1959 : Register of Current (edited by D. Ryle Masson), (South African Council for Scientific and Industrial Research), 854
Scientific Research and Development : A Bibliography on the Economic and Social Implications of (United States National Science Foundation), 14
  Projects in Colleges and Universities on the Economic and other Impacts of (United States National Science Foundation), 14
Scientific Research and Technical Services in the Federation of Rhodesia and Nyasaland : Government Organizations and Statutory Bodies concerned with, 202
Scientific Russian without Tears (Prof. J. W. Perry), 359
Scientific Societies, South-Eastern Union of : Sixty-fifth Annual Congress, 770
  Presidential Address, East Anglian Mammals (Lord Cranbrook), 770
  Presidential Address to the Archaeological Section, Archaeology in Suffolk (N. Smedley), 770
  Presidential Address to the Botanical Section, Changes In the Suffolk Flora during the Past 100 Years (F. W. Simpson), 771
  Presidential Address to the Geological Section, Investigating Glacial and Interglacial Geology in East Anglia (Dr. R. G. West), 771
  Presidential Address to the Zoological Section, Some East Anglian Butterflies (S. Beaufoy), 771
Scientific Techniques in Art and Archaeology (Dr. A. E. Werner), 674
Scientific Techniques in the Conservation of Paintings, 437
Scientific Unions, International Council of : Work of the Abstracting Board (Prof. E. A. Boutry), 358
Scientific Unions, International Council of (Committee on Space Research) : First International Space Science Symposium, 749
Scientific and Industrial Research The Balance of, 997
Scientific and Industrial Research, Department of : Grants to the University of Oxford—£1,170 for the purchase of apparatus for the structural investigation and synthesis of peptides, to be carried out in the Dyson Perrins Laboratory , £10,800 for the purchase of an electron-microscope for use in research in the Department of Metallurgy ; £7,450 for work being carried out in the Clarendon Laboratory ; and £940 for work on the expansion of X-ray fluorescence analysis to lower atomic numbers being carried out in the Research Laboratory for Archaeology and the History of Art, 126
  Grants to the University of Bristol—£6,500 to the Department of Physics, in connexion with an investigation of high-altitude flight and recovery techniques in the Mediterranean region ; £1,600 to the Department of Organic Chemistry, for an investigation into the structure and synthesis of natural products ; £2,200 to the Department of Physics, towards research on the study of fragmentation of heavy cosmic ray nuclei in hydrogen and carbon, 284
  Automatic Control in Soviet Industry, 287
  Appointment of Dr. J A. Saxton as deputy director of the Radio Research Station, Slough, 357
  Problems of Progress in Industry, No 5, Human Problems of Innovation (Based on a Study of some Scottish Firms by Tom Burns and G. M. Stalker), 419
  Name of the Control Mechanisms and Electronics Division of the National Physical Laboratory to be changed to Autonomics Division, 440
  Open days at the National Physical Laboratory, 523
  Grant of £2,055 to the Department of Zoology in the University of Leeds, for research projects under the direction of Dr. Broadhead, 767
  Structural Loading in Factories, 851
  Appointment of A. C. Copisarow as director of the Forest Products Research Laboratory, 934
  Industrial Research and Development Expenditure 1958, 997
Scientific and Industrial Research, Department of (Chemical Society, in co-operation with the) . To issue a translation of the *Russian Journal of Physical Chemistry*, 601
Scientific and Industrial Research, Indian Council of : The Wealth of India, a Dictionary of Indian Raw Materials and Industrial Products—Raw Materials, Vol 5, H–K, *review* by Dr. F. N Howes, 70
Scientific and Industrial Research, Indian Council of (Chemical Research Committee) · Symposium on Proteins, 767
Scientific and Industrial Research, Department of (New Zealand) : Report for 1958-59, 129
Scientific and Industrial Research, South African Council for : Register of Current Scientific Research at South African Universities, 1959 (edited by D. Ryle Masson), 854
Scientific and Industrial Research Organization (Australian Commonwealth) : Appointment of Lord Casey and E. P. S. Roberts as members of the Executive, 12
  Rural Research, 29, Mistletoe in Australia (G. C Greenham), 135
  Appointment of Dr Geoffrey Kesteven as director of fisheries research in the Division of Fisheries and Oceanography at Cronulla, 280
  Appointment of Dr Douglas F Waterhouse as chief of the Division of Entomology, 763
  Symposium on Nitrogen in Tropical Agriculture, 941
  Symposium on Visco-Elastic Systems, 942
Scientific and other Fields of Learning The Problem of Language in Publications of Works in (Prof. D. Keilin), 912
Scientific, Medical and Technical Conferences Guide to Press Arrangements for (edited by Ronald Bedford), 437
Scientific and Technical Books · Recent, Supp. vi, April 30 ; Supp. vi, May 28 , Supp vi, June 25
Scientific and Technical Research : Co-operation in the Field of (Organization for European Economic Co-operation), 998
Scientist : The (Ministry of Labour and National Service, Choice of Careers Series No. 100), 682
Scientist (British) : The Wandering, 436
Scientists : Russian for, 359
Scientists (Consulting), Association of : Election of Officers for 1960–61, 766
Scientists (Scientific Institutions and), in Latin-America (Unesco, Centro de Cooperacion Cientifica para America Latina), Vol. 1, Paraguay ; Vol. 2, Chile, 203
Scientists and Administration (T H. Hawkins), 446
Scintillation Counting of Carbon-14 (David S. Jenkinson), 613
Scintillation Techniques : Radiocarbon Dating System using (C. F. G. Delaney and I. R. McAulay), 204
Sclerotium rolfsii Sacc : Perfect Stage of (Prof. A P. Misra and S Q. Haque), 567
Scotland (South-West) : *Elminius modestus* Darwin in (H. Barnes and Margaret Barnes), 989
Scotland (West Coast of) : Occurrence of *Falkenbergia rufolanosa* on the (Dr. Elsie Conway), 566
Scott, Dr. A. E. · Appointed lecturer in chemistry at the University of Bristol, 937
Scott, Dr. A. I. . Biosynthesis of Colchicine, 556
Scott, Dr J. F. : Stevin's Mathematical Works, *review*, 60

Scott, Dr. T. G , and others . Antithromboplastin in Human Serum and Plasma, 248
Scott, V. D. : Formation of Beryllium Carbide during the Corrosion of Beryllium in Carbon Monoxide and in Carbon Dioxide Gas, 466
Scottish Geographical Society (Royal) : Seventy-fifth Anniversary Exhibition (Mapping Britain), 523
Scottish Geology, 1019
Scottish Home Department, and others : Postgraduate Training Grants in Fishery Research, 360
Sea (Central Tyrrhenian) : The Sediments of the (E. Norin), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, Sediment Cores from the Mediterranean Sea and the Red Sea, No. 1), 609
Sea (Mediterranean) and the Red Sea · Sediment Cores from the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, No 1), 609
Sea (Red) : Sediment Cores from the Mediterranean Sea and the (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 8, No. 1,) 609
Sea-Level Air Pressure . New Record Low (C. L. Jordan), 283
Sea-lion (California), *Zalophus californianus* Chronic Aortitis in the (Dr. Arthur L. Kelly and Dr. David Jensen), 731
Sea-Water as the Primary Source of Sulphate in Tidal Swamp Soils from Sierra Leone (J C D. Watts), 308
Seal, Vera G , and Chambers, Rosalind (Barbara Wootton, assisted by) : Social Science and Social Pathology, *review* by Prof. E. Stengel, 41
Seal (Harbour), *Phoca vitulina* L. · Age Determination in the (A. W. Mansfield and H. D. Fisher), 92
Seaman, Dr G. F. V. · Elected to a Beit Memorial Junior Fellowship for Medical Research, 520
Searle, Dr A. G. · Genetic Radiation Hazards, *review*, 109
Searle, W H. · *Obituary* by Dr F. S Russell, 518
Sears, L. (Legg, S. P , and) : Zinc Sulphate Treatment of Parakeratosis in Cattle, 1061
Sears, Prof Paul B. Retirement from the Department of Botany, Yale University, 1020
Seasonal Differences in Ovulating Hormone in the Merino Ewe (Dr. D. R. Lamond), 971
Seaway The St. Lawrence (Lionel Chevrier), *review* by Prof R W. Steel, 110
  The St. Lawrence (Prof. T. L Hills), *review* by Prof R. W Steel, 110
Sechzig Jahre Medizinische Radiologie (Prof Hans R. Schinz), *review* by Dr. R E. Steiner, 921
Secker, Dr. P. E (Lewis, Dr T. J., and) Effect of Cathode Surface Roughness and Oxidation on Arc Movement, 30
Second Crystalline Modification in Polyethylene · Effect of a, on X-Ray Crystallinity Measurements (Dr C. G. Vonk), 962
Secondary Growth in Plants · Detoxication during (C M. Stewart), 374
Secondary Schools. Science in (Ministry of Education, Pamphlet No. 38), 663
Secondary Wall (Outer), on Unbleached Spruce Sulphite Fibres : Structure of the (O. Kallmes and J. A. S. Newman), 566
Secretion (Gastric), of Hydrogen Ions : Mechanism of the (Prof. Spyridon G. A. Alivisatos), 368
Sectioned Tissues : A Method of Staining, with Lead for Electron Microscopy (Dr. J D. Lever), 810
Sections (Ultra-Thin) : Water-Soluble Methacrylates as Embedding Media for Preparation of (Dr. O. Wichterle, Dr. P. Bartl and Dr. M. Rosenberg), 494
Secular and Periodic Motions of the Node of an Artificial Earth Satellite (Prof. Leon Blitzer), 874 ; (D. G. King-Hele), 875
Sediment (Bed) : Haemoglobin Content of the Larvae of *Tendipes f.l. plumosus* L. from Various Levels of (B Czeczuga), 484
Sediment Core from the Central Equatorial Pacific : X-Ray Determination of Phillipsite in a (F. Lippman), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 3), 609
Sediment Core from the Mindanao Trough (K. Frediksson), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 4), 609
  Mineralogical Composition of some <2 Micron Fractions in a (J. Ch. L. Favejee), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Sediment Cores from the West Pacific, No. 5), 609
  A Note on the Foraminifera in a (R. A. Reyment), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 6), 609
  Fragments of Calcareous Algae in a (H. Horn af Rantzien), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 6, Sediment Cores from the West Pacific, No. 7), 609
Sediment Cores from the Mediterranean Sea and the Red Sea (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, No. 1), 609
Sediment Cores from the North Atlantic Ocean (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Nos. 4-5), 609
Sediment Cores from the West Pacific (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol 6, Nos. 4-7), 609
Sedimentation : Theory and Practice of, *review* by Dr. K. V Shooter, 56
Sedimentation (Concentration-Dependent), of Aggregating Proteins in the Ultracentrifuge (Dr. G A. Gilbert), 882
Sedimentpetrografische Untersuchung der Lotkerne 255 und 257 (F. W. Locher), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 7, Sediment Cores from the North Atlantic Ocean, No. 4), 609
Sediments of the Central Tyrrhenian Sea (E Norin), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 8, Sediment Cores from the Mediterranean Sea and the Red Sea, No 1), 609
Sedlák, Jozef : Level of Sulphydryl Compounds in Rat Liver following Feeding with Goitrogenous and Non-goitrogenous Cabbage, 892
Seed, Dr. John C , and others : Improvement of the Intravenous Glucose Tolerance Test, 808
Seed (Lettuce) Presence of Gibberellin-like Substances in (Dr. S. Blumenthal-Goldschmidt and Prof. A Lang), 815
Seedlings (Wheat) · Chlorophyll Content of Gibberellin-treated (Prof Frederick T. Wolf and Dr Alan H. Haber), 217
Segregation (Spontaneous and Induced Somatic), in *Aspergillus nidulans* : High Frequency of (Dr. Etta Kafer), 619
Seismic Net (A Telemetered), in Tasmania (Prof Gordon Newstead and P A. Watt), 704
Seismic *P* and *S* Waves Structure of the Upper Mantle as derived from the Travel Times of (Dr I. Lehmann), 956
Select Committee on Estimates : Fifth Report from the, Session 1958-59, United Kingdom Atomic Energy Authority (Production Group and Development and Engineering Group), 1
Selection for High-Order Resistance to 'Dieldrin' in *Lucilia cuprina* Wied. (G J Shanahan), 100
Selection of Iodinated Protein in the Young Mouse (W A. Hemmings), 399
Selective Elimination of Single Sense Cells with Methylene Blue (Dr. Ulrich Clever), 812
Selective Visits of Butterflies to Flowers—a Possible Factor in Sympatric Speciation (K. R. Dronamraju), 178
Selenium in the Rat : Whole-Body Turn-over of (Clifton Blincoe), 398
Self-Quenching Geiger Counters containing Mixtures of Permanent Gases (Dr. Oswald Riedel), 876 ; (A. J L. Collinson, I. C Demetsopoullos, J. A. Dennis and J. M. Zarzycki), 876
Self-Regulation for Children, *review* by Prof. M. D. Vernon, 38, 912 , (Paul Ritter), 911
Self-supporting Metal Fresnel Zone-plate to Focus Extreme Ultra-violet and Soft X-Rays (Dr. Albert V. Baez), 958
Self-sustaining Corbino Disk : The Possibility of a (Dr. D. Midgley), 377
Self-trapped Electrons ('Polarons') : Primary Processes in the Action of Ionizing Radiations on Water—Formation and Reactivity of (Prof. Joseph Weiss), 751
Selye, Prof. Hans · The Chemical Prevention of Cardiac Neuroses, *review* by Dr D. C. Deuchar, 423
Semiconductor Components, 602
Semiconductors, Ltd (Royal Aircraft Establishment, and) : The *Corsair*, a Digital Differential Analyser, 201
Sen, N. N , and others : Foetal Haemoglobin in the Monkey, 977
Senior Research Fellowships (United States Public Health Service), 439
Sense Cells : Selective Elimination of Single, with Methylene Blue (Dr. Ulrich Clever), 812
Sensitivity of Thermal Conductivity Detectors : Effect of Carrier Gas on the (C Bokhoven and A. Dijkstra), 793
Sensitivity (Phage), in *Erwinia amylovora* : An Association between Capsulation and (Eve Billing), 819
Sensitized Mast Cells : Antigen-induced Damage to Isolated (Dr I Mota and W Dias da Silva), 245
Sensory Specialization in Response to Environmental Demands (Zoological Society of London Symposium on), 688
Separation of the α- and β-Chains of Globins by means of Starch-gel Electrophoresis (C J. Muller), 643
Septicaemia (Haemorrhagic) Mechanism of Immunity in (R V. S. Bain), 734
Sera (Normal Human) : Agar-gel Electrophoretic Demonstration of Individual Variations in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_1-Globulin Region of (Dr Jan Hirschfeld), 321
Serengeti National Park (Dr. A. S. Thomas), 605
Serial Irradiation : Changes in the Deoxyribonucleic Acid Content of Mouse Sarcoma 37 Cells following (Dr. A. E. G. Pearson and N. B. Atkin), 647
Serjeant, E. P. . Preparation of Pure Standard Metallic Perchlorate Solutions, 963
Seromucoid Contents of Human Bile (Dr. C. Mihaescu and Edith Mihaescu), 394
Serotonin Content of the Pineal Glands of Man and Monkey (Prof. Nicholas J. Giarman, Daniel X. Freedman and Luis Picard-Ami), 480
Serratia · Induction and Reversion of *c*-Mutations by Irradiation of the Extracellular χ-Phage of (Prof. R. W Kaplan, U. Winkler and H. Wolf-Ellmauer), 330
Serum : Measurement of Transaminases in (Dr. H. Yatzidis), 79
Serum (Blood) : Determination of Calcium in, by Atomic Absorption Spectroscopy (J. B. Willis), 249
Serum (Human) : A Haemoglobin-binding β-Globulin in (Dr. M. P. Tombs), 1055
Serum (Rabbit Antiglobin) : Observations on Globin, Haemoglobin and Haptoglobin using a (D. S. Rowe and J. F. Soothill), 975
Serum (Saliva–) Ratios of Tritium after the Administration of Tritiated Water (Dr. A. J. Coppen and Dr. J. L. Gibbons), 724
Serum Albumin (Bovine) · Iodination of Specific Sites on (Dr. David Pressman and Dr. Gerald Radzimski), 1049
Serum Groups (Haptoglobin) Frequencies of the, among Blood Donors from Austria and Germany (Dr. H. Baitsch, G. Meier, L. Scoeller and D. M. Kahlich-Koenner), 976
Serum Proteins of Pigs : Thread Protein and β-Globulin Polymorphism in the (G. C. Ashton), 991
Serum, Connective Tissue and Osseous Chemistry in Lathyritic Rats : Aortic, (Dr. R. A. Grant, M. Hathorn and Prof Theodore Gillman), 164
Serum and Milk from Cattle : Inheritance of β-Globulins in (Bo Gahne, Jan Rendel and Dr. Ole Venge), 907
Serum and Plasma (Human) : Antithromboplastin in (Dr. T. G. Scott, Dr. C. Symons and R. L. Markham), 248
Serum and Pleural Fluid . Mucopolysaccharides of (Prof C W. Fishel), 804
Serum Filtrates Presence of Protein in some (Dr. F J Scandrett), 558
Serum Gonadotropin (Pregnant Mare) : Effect of *p*H on Biological Activity of (Bengt H. Persson and Stig E. J. Melander), 163
Serum Haptoglobin in Rabbits : Elevation of, in Response to Experimental Inflammation (R. K. Murray and G. E. Connell), 86
Service to Management : Organization and Methods, a (edited by G. E. Milward), *review* by E. S Hiscocks, 62
Services (Psychiatric), and Architecture (A Baker, R. Llewelyn Davies and P. Sivadon), (United Nations, World Health Organization, Public Health Papers No 1), 936
Services (Technical), in the Federation of Rhodesia and Nyasaland · Government Organizations and Statutory Bodies concerned with Scientific Research and, 202
Services (Training), in Industry (Industrial Training Council), 123
Seshachar, Prof B. R. Effect of Centrifugation on the Macronucleus of *Spirostomum* and *Blepharisma*, 333
Seshadri, Prof T. R. : Elected a Fellow of the Royal Society, 11
Settlement Size and Population : Increase of, since the Inception of Agriculture (Dr. Max Pettersson), 870
Severing the Olfactory Bulbs · Effect of, on the Intake and Excretion of Water in the Rat (V. Nováková and H. Dlouhá), 638
Sewage Effluent Discharge · Effect of a, on the Deposition of Calcium Carbonate on Shells of the Snail *Potamopyrgus jenkinsi* (Smith), (R. W. Edwards and J Heywood), 492
Sewage Purification, Institute of : Annual Conference, 127, 938

Sex in a Parthenogenetic Parasite : Environmental Determination of (F. Wilson and L. T. Woolcock), 99
Sex Difference in Accidental Mortality of Guppies exposed to Elevated Temperature (Prof. John A. Freeman), 491
Sex Organ (Male), in certain Fern Species : Purification of a Specific Inducer of the (Ross B. Pringle, Ulrich Naf and Armin C. Braun), 1066
Sex-Ratio : Evolutionary Origin of Sexual Differentiation and the (Dr. H. Kalmus and Dr C. A. B Smith), 1004
Sex Ratio of Ammocoetes (M. W. Hardisty), 988
Sex Ratio at Birth · Dependence of the, on the Age of the Father (Dr. Leo Szilard), 649 , (Dr. A. Comfort), 1065
Sex Ratio in *Drosophila* Homeostasis of the (Dr. P. A. Parsons), 411
Sexual Differentiation : Evolutionary Origin of, and the Sex-Ratio (Dr. H. Kalmus and Dr C. A. B. Smith), 1004
Sexual Reproduction in *Opalina ranarum* Parasitic in *Rana temporaria* : Endocrine Control of (Dr M. El Mofty and Prof. J. D. Smyth), 559
Shain, C. A. : *Obituary* by Dr. J. L. Pawsey, 594
Shakespeare and Medicine (R. R. Simpson), *review* by Sir Russell Brock, 35
Shakespeare's Writings : Medicine in, *review* by Sir Russell Brock, 35
Shanahan, G. J. : Selection for High-Order Resistance to 'Dieldrin' in *Lucilia cuprina* Wied , 100
  Genetics of Resistance to Dieldrin in *Lucilia cuprina* Wied , 181
Shand, J. A., and others · Influence of Geological Features on Very Low Frequency Geomagnetic Fluctuations, 141
Shanta, Dr. P : Recent Advances in Coconut Research in India, 861
Shape Discrimination in *Octopus* : Theories of (The Visual System of *Octopus*), (Dr N. S Sutherland), 840
Shape and Function of a Salivary Mucoprotein : Correlation between Composition, Structure, (Dr. Alfred Gottschalk), 949
Shapley, Prof. Harlow : The Inner Metagalaxy, *review* by Dr. D. W Dewhirst, 109
Sharma, J. C., and others Influence of Dietary Intake of certain Insecticides on the Haemoglobin and Erythrocyte Contents of Chick Blood, 172
Sharman, Dr. B. C *Volvox* Colonies and the Snail 'Cystase', 90
Sharman, D. F. (Ashcroft, G W., and) : 5-Hydroxyindoles in Human Cerebrospinal Fluids, 1050
Sharman, G. A M : Minor Elements in Nutrition (Selenium in Animal Health), 940
Sharp, Dr. R. A., and others : Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in Chondritic Meteorites, 863
Shearman, D. J. *Obituary* of Dr. Francis Jones, 596
Sheath (Peripheral Nerve Fibre Myelin) Neurokeratin Network of the, as a Centre of Metabolic Activity (Dr. H. B. Tewari and Prof Geoffrey H. Bourne), 645
Sheep . Anthelmintic Efficiency of Tetrachlorodifluoroethane again *Fasciola hepatica* in (J. C. Boray and I. G Pearson), 252
  Methane Exhalation in (E. Cresswell), 560
  Retarded Development of *Ostertagia* Species in (J D Dunsmore), 986
Sheep Husbandry and Wool Technology at Pretoria, 280
Shells of the Snail *Potamopyrgus jenkinsi* (Smith) . Effect of a Sewage Effluent Discharge on the Deposition of Calcium Carbonate on (R. W. Edwards and J. Heywood), 492
Shell Mex and B.P. Ltd : Contribution of £20,000 to the 1962 Centenary Appeal Fund of the University of Southampton, 284
Shepherd, Robert J , and others : Purification and Properties of Cauliflower Mosaic Virus, 656
Shettles, Dr. Landrum B. : Nuclear Morphology of Human Spermatozoa, 648
Shibuya, Dr T. (Takagi, Dr. S. F., and) : Potential Oscillations in the Lower Olfactory Pathway of the Toad, 724
Shielding (Reactor) : Fundamental Aspects of (Dr. Herbert Goldstein), *review* by Dr T. E. Allibone, 917
Shikimic Acid : Production of, by *Penicillium griseofulvum Dierckx* (Prof. Paul Simonart and Anselme Wiaux), 78
Shimizu, Dr. Nobuo, and others : Histochemical Demonstration of Ascorbic Acid in the Locus Coeruleus of the Mammalian Brain, 479
Shimwell, J. L (Carr, J. G., and) . Pigment-producing Strains of *Acetobacter aceti*, 331
Shirasaka, M , and others : Microbiological 11β-Hydroxy Dehydrogenation of Corticosterone, 390
Shirkov, D. V., and others : A New Method in the Theory of Superconductivity (translated from the Russian), *review* by Dr. C. G. Kuper, 833
Shock (Heat) : Blocking of Mitosis by (Per Bergan), 905
Shooter, Dr K. V. : Theory and Practice of Sedimentation, *review*, 56
Shores (Jamaican) : Occurrence of *Halimeda opuntia* var. *minor* on (P. F. James), 493
Short Genetic Interval in *Drosophila melanogaster* : Apparent Double Crossing-Over in a (Prof. M. M. Green), 990
Shrimps · Cave-dwelling (A. Snell), 521
Shunted Flow of Blood (Intrahepatic) in Cirrhosis of the Liver : Measurement of the (T. Nakamura, S. Nakamura and K. Tokita), 243
Sialic Acid (Nonulosaminic Acid) in Protists (Dr. S. Aaronson and T. Lessie), 719
Sialic Acids : Thiobarbituric Acid Spray Reagent for Deoxy Sugars and (Dr. Leonard Warren), 237
Sibatani, Prof A , and others . Fractionation of Two Metabolically Distinct Classes of Ribonucleic Acids in Animal Cells and its Bearings on Cancer, 215
Sibatani, Prof. A. (Okagaki, H , and) Effects of Chloramphenicol on the Recovery of Ultra-violet-irradiated *Escherichia coli B*, 818
Sickle-Cell Anaemia in Nigerian Children (R. G. Hendrickse), 1027
Siegel, Dr Benjamin V. . Filamentous Structures in Ectromelia Virus-infected Cells, 820
Siegel, Dr B Z , and Siegel, Dr. S M. : Enhancement of Peroxidase Action by Polysaccharides, 391
Siegel, Dr. S M (Siegel, Dr. B. Z , and) : Enhancement of Peroxidase Action by Polysaccharides, 391
Sierra Leone · Sea-Water as the Primary Source of Sulphate in Tidal Swamp Soils from (J. C. D Watts), 308
Sigel, Dr. M. M., and Grant, Dr. L S. : Medical Research in the British Caribbean (Intra-dermal Inoculation against Asian Influenza), 863
Sigmoid Survival Curve in Radiobiology (Dr. Tikvah Alper, Dr. N. E. Gillies and Dr. M. M. Elkind), 1062
Signals (Direct Current) : Transistor Modulators for Low-Level (J. F. Evans), 626
Signals (Radio), from Artificial Satellites : Electron Density Measurements in the Upper Ionosphere using the Faraday Rotation of (Dr. D. McL. A. Wilson), 623
Significance : Earthquakes and Uranus—Misuse of a Statistical Test of (E. J. Burr), 336 ; (Prof. R. Tomaschek), 337
Significance of Adrenals for Increased Oxygen Consumption in Rats during Irradiation (Dr. A Vacek), 90
Significance of the 'Equivalent Redox Potential' in Aqueous Solutions under Ionizing Radiation (Dr. G. H. Cartledge), 370
Significance (Biological), of Peptide containing Hydroxyproline during the Development of Carrageenin Granuloma (Dr. M. Chvapil and B. Cmuchalová), 806
Significant Trends in Medical Research : Ciba Foundation Symposium on (edited by G. E. W. Wolstenholme, Cecilia O'Connor and Maeve O'Connor), *review* by Prof. L J. Witts, 42
Silcox, A. A , and others : Life-like Preservation of Cytoplasmic Detail in Plant Cells, 1068
Silene and *Saponaria* : Basic Chromosome Numbers in (Dr. T. N. Khoshoo), 412
Silica–Alumina Catalysts : Infra-Red Spectra of Ammonia adsorbed on (D. E. Nicholson), 630
Silicon Absorption Spectra of Diatomic Radicals containing Boron or (Dr. B. A. Thrush), 1044
Silicon in the Metal Phase of Enstatite Chondrites (A. E. Ringwood), 465
Silkworm, *Bombyx mori* L. : Xanthine Dehydrogenase in the (Yoshiyuki Hayashi), 1053
Sillans, Roger : Les Savanes de l'Afrique Centrale, *review* by J. P. M. Brenan, 505
Sills, S. A. (Dainton, Prof. F. S , and) : Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-violet Light, 879
Silobrčič, V , and others : Graft versus Host Reaction in Parabiotic Disease, 322
Siloxane Polymers (Dimethyl) . Proton Magnetic Resonance in a Series of—a Specific Long-Chain Effect? (Dr. J. G. Powles and A. Hartland), 26
Silva, M. A., and others : A Technique for Sampling Oxide Layers and Brittle Materials for Microdiffraction, 147
Silver, Ann : Ataxia in Hens poisoned by Tri*para*ethylphenyl Phosphate, 766
Silver, Dr. Richard T., and others : Evidence for a New Allele in the Kidd Blood Group System in Indians of Northern Mato Grosso, Brazil, 481
Silver Single Crystals : Orientation of Stearic Acid Monolayers on (Robert T. Mathieson), 301
Silver-activated Nitrocellulose as Recording Material for X-Ray Microscopy (Saara K. Asunmaa), 1036
Silver–Cadmium Alloy : Thin Films of (K. Bahadur and P. V. Sastry), 467
Silverblatt, Dr. F. (Green, Dr. H., and) : Effect of Antibody and Complement on Volume Control in an Ascites Tumour Cell, 646
Simmonds, N. W. Bananas, *review* by Prof. C. W. Wardlaw, 48
Simmons, L. M. : Periodic Classification of Elements, 154
Simon, Albert : An Introduction to Thermonuclear Research, *review* by Dr. T. E. Allibone, 917
Simonart, Prof Paul, and Wiaux, Anselme Production of Shikimic Acid by *Penicillium griseofulvum* Dierckx, 78

Sodium-24, Potassium-42 and Iodine-131 . Clearance Rates of, in Normal Dog Hip Joints (Prof. Patrick G. Laing and Dr. Ik Dong Kim), 898
Sodium Hydroxide (Concentrated), or Potassium Hydroxide : Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with (J Wawrzyniak and Dr. B. Sujak), 467
Sodium Iodide in Benzene : Reaction of *p*-*n*-Decyloxybenzenediazonium Fluoborate with (Prof. W. Bradley and J. D. Thompson), 631
Sodium/Potassium Ratio in Rain-Water (Dr. A. T. Wilson), 705
Soft X-Rays (Ultra-violet and) : A Self-supporting Metal Fresnel Zone-plate to Focus Extreme (Dr. Albert V. Baez), 958
Soil Conditions in New Zealand : An Association between Dental Caries and certain (T. G. Ludwig, W. B. Healy and Capt F. L. Losee), 695
Soil Surfaces (Tropical) : Capillary Movement of Nitrate towards (R. Wesselaar), 572
Soils Discussion Group (Welsh) : Field Meeting, 127
Soils (Paddy), and Rice Production (Dr. H. Greene), 511
Soils (Tidal Swamp), from Sierra Leone Sea-Water as the Primary Source of Sulphate in (J. C. D. Watts), 308
Solar Extreme Ultra-violet Radiation as a Source of Interplanetary Ionization (Dr Hans E. Hinteregger), 523
Solar Flare of July 10, 1959 : Ionospheric Effects associated with the (V. A. H. Harrison), 228
Solar Furnace Glass (Origin of Tektites), (Dr. Gerald S. Hawkins and Dr. Sumner H. Wolfson), 1027
Solar Limb Surges accompanied by X-Ray Emission (Dr. J. Kleczek and Dr. L. Křivsky), 1035
Solar Radio Emission and Polar Cap Absorption of Cosmic Noise : A Relation between (Dr M. R. Kindu and Prof. F. T Haddock), 610
Solar System : Dirac's Cosmology and the Origin of the (Prof. L. Egyed), 621
Solar Terrestrial Relationships (K. D. Cole), 874
Solar Ultra-violet Spectrum : Rocket and Satellite Observations of the (R Grant Athay), 1036
Solberg, Bjorn (Dougherty, Dr. Ellsworth C., and) : Monoxenic Cultivation of an Enchytraeid Annelid, 1067
Solid Imperfections : Superficial Chemistry and (Prof. F. C. Tompkins), 3
Solid Metals Determination of Adsorption in Double Layers involving (Dr. Erik A. Blomgren and Dr. John O'M. Bockris), 305
Solid Oxygen (Copper and), condensed at Very Low Temperatures from a Gas Discharge : Reaction between (Jerome Kruger and William J. Ambs), 794
Solid State Electronics, No 1, 851
Solid State Physics Russian–English Glossary of (edited by I. Emin), *review* by Prof S. I. Tomkeieff, 347
Solids · Conduction of Heat in (Prof H. S Carslaw and Prof J. C. Jaeger), second edition, *review* by Prof L. S. Goddard, 421
  Lattice Defects and the Mechanical Properties of (International Union of Crystallography Symposium on), 1020
  Mathematics and the Conduction of Heat in, *review* by Prof L. S. Goddard, 421
  The Tesla-coil Method for producing Free Radicals from (Dr C. H. Bamford, A D. Jenkins and J. C. Ward), 712
  Time-Dependent Tensile Strength of (Dr. C. C. Hsiao), 535
Soluble (Water-) Methacrylates as Embedding Media for Preparation of Ultra-Thin Sections (Dr. O. Wichterle, Dr. P Bartl and Dr. M. Rosenberg), 494
Solution : Disproportionation and Dimerization of the Benzyloxyl Free Radical in (Dr. J B de Souza and S. K. Ho), 776
Solution (Dilute Aqueous) Chemical Effects of Ionizing Radiation on Deoxyribonucleic Acid in (G. Hems), 710
Solutions (Aqueous) . Use of Nitrous Oxide to discriminate between the Forms of Hydrogen Atoms (H· and H_2^+?) produced by γ-Irradiation of (Prof F. S Dainton and Dr D. R. Peterson), 878
Solutions (Aqueous), under Ionizing Radiation . Significance of the 'Equivalent Redox Potential' in (Dr. G. H. Cartledge), 370

Solutions (Aqueous), of Potassium Iodide irradiated with Ultra-violet Light . Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in (Prof. F S Dainton and S. A. Sills), 879
Solutions (Concentrated) : The Physico-chemical Constants of Binary Systems in (Prof Jean Timmermans), Vol. 1, Two Organic Compounds (without Hydroxyl Derivatives) ; Vol. 2, Two Organic Compounds (at least one a Hydroxyl Derivative), *review* by Dr. E. F. G Herington, 918
Solutions (Cupric Alkanoate) : Nature of (Dr. D. P. Graddon), 715
Solutions (Perchlorate) Preparation of Pure Standard Metallic (E. P Serjeant), 963
Solutions (Water) Ultra-Violet Spectra of (R M Golding), 308
Solvent Polarizability : Effect of, on the Ultra-violet Spectral Shifts of Aromatic Compounds (Dr F. A. Bovey and S. S. Yanari), 1042
Solvents containing Ethyl Iodide : Use of, in the Investigation of Phosphorescence Spectra of Organic Compounds (Dr. I. J. Graham-Bryce and J M. Corkhill), 965
Solvents and Dry Cleaning, 764
Somatic Antigen 15 as a Precursor of Antigen 34 in *Salmonella* (Hisao Uetake and Shin Hagiwara), 261
Somatic Segregation (Spontaneous and Induced) in *Aspergillus nidulans* · High Frequency of (Dr. Etta Kafer), 619
Sommer, Prof. Karlheinz Elected a member of the Medicine Section of the Leopoldina Academy of Natural Sciences, 766
Sondheimer, Dr. E. H. Appointed to the University of London chair of mathematics in Westfield College, 440
Soothill, J. F. (Rowe, D. S , and) : Observations on Globin, Haemoglobin and Haptoglobin using a Rabbit Antiglobin Serum, 975
Sor-Rondane Mountains (Queen Maud Land) . Geological Reconnaissance of the (Prof E. E Picciotto), 740
Sorsby, Arnold, and others (edited by) : Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R C Davenport, 42
Sounding Rockets (Homer E Newell, jun.), *review* by W. H Stephens, 269
Sounds : Korotkov's—Action of the Heart (Wing-Comdr. J E. Malcolm), 723
Source of Interplanetary Ionization . Solar Extreme Ultra-violet Radiation as a (Dr. Hans E. Hinteregger), 523
Source (Major), of Electrical Energy Fuel Cells—Will they soon Become a (F. T. Bacon), 589
Source (Primary), of Sulphate in Tidal Swamp Soils from Sierra Leone : Sea-Water as the (J. C. D. Watts), 308
Source Book in Greek Science (Prof Morris R Cohen and Dr. I E. Drabkin), second printing, with corrections, *review*, 63
South Africa A Mesozoic Microflora from (A. R. H. Martin), 95
  True's Beaked Whale from the South-East Coast of (F H. Talbot), 406
South Africa, Royal Society of · Election of Officers and Council for 1960, 766
South African Council for Scientific and Industrial Research · Register of Current Scientific Research at South African Universities, 1959 (edited by D. Ryle Masson), 854
South African Universities : Register of Current Scientific Research at, 1959 (edited by D Ryle Masson), (South African Council for Scientific and Industrial Research), 854
South Australia : Late Precambrian Fauna in (M. F. Glaessner and B. Daily), 205

Srivastava, Prof B. K., and others : Influence of Dietary Intake of certain Insecticides on the Haemoglobin and Erythrocyte Contents of Chick Blood, 172
St. Lawrence Seaway (Lionel Chevrier), *review* by Prof R. W. Steel, 110
St. Lawrence Seaway (Prof. T. L. Hills), *review* by Prof. R W. Steel, 110
St. Mary's Hospital Medical School, London : Grant of £2,500 per annum for up to 5 years from the Wellcome Trust, to provide technical assistance and research expenses for work on the physiology of pre-natal growth, 439
  Appointment of Dr R. E. O. Williams to the University of London chair of bacteriology, 938, 1016
St. Salvator's College, St Andrews : Appointment of Dr. D. V. Osborne as senior lecturer in the Department of Natural Philosophy, 767
Stability in Celestial Mechanics (Prof Yusoke Hagihara), *review* by Dr. R. H. Garstang, 60
Stability (Glutathione), and Pyrophosphatase Activity in Reticulocytes—Direct Evidence for the Importance of Glutathione for the Enzyme Status in Intact Cells (Prof. S Rapoport and D. Scheuch), 967
Stacey, Prof M., and others Pentafluoropyridine, 231
  Infra-red Spectra of Deuterium-labelled Carbohydrates, 307
  Behaviour of some Aldehydes on a Sulphonated Polystyrene Resin, 469
Stachera, H. S. . Appointed lecturer in electronics at the University of Southampton, 284
Staff College for Technical Teachers, 185
Stage (Perfect), of *Fusarium oxysporum* Schl. forma *pisi* (Lindf.) S. and H. ? : Is *Nectria haematococca* Berk. and Br. the (W. L Gordon), 903
Stage (Perfect), of *Microsporum gypseum* (Dr. D. M. Griffin), 94
Stage (Perfect), of *Sclerotium rolfsii* Sacc. (Prof. A P. Misra and S. Q. Haque), 567
Stain (A Specific), for Mast Cell Granules (Dr. B. G. Radden), 400
Staining Schedules : Biology (R. R. Fowell), sixth edition, 125
Staining Sectioned Tissues with Lead for Electron Microscopy : A Method of (Dr. J. D. Lever), 810
Stalker, G. M. (Burns, Tom, and) : Human Problems of Innovation—Based on a Study of some Scottish Firms (Department of Scientific and Industrial Research, Problems of Progress in Industry No. 5), 419
Stamburgo, M., and others Synergetic Action of 2(*o*-Methoxyphenoxymethyl)-5-Oxazolidone on Morphine, Dihydrocodeine and Aminopyrine Analgesia, 893
Stamp, Prof. L. Dudley : Physical Geography, *review*, 190
  The Le Play Society, 606
Standard Metallic Perchlorate Solutions : Preparation of Pure (E. P. Serjeant), 963
Standardization of Drugs : The Use of Laboratory Animals in the (Research Defence Society, Pamphlet No 1;), 438
Standards, United States National Bureau of : Monograph No. 5, Preservation of Documents (W. K. Wilson and B W. Forshee), 124
Standards (New Weight), for Men and Women (Metropolitan Life Insurance Co Ltd , New York, Bulletin, Vol 40), 445
Standing Advisory Committee for Medical Research in the British Caribbean Fifth Annual Scientific Conference, 862
Stanley, H M. : Polymeric Progress (The Impact of Petrochemical Development on the Plastic Industry), 442
Stansfield, Prof. H. *Obituary* by C. E. Chester, 517
Staphylococcal Virulence for Mice : Enhancement of, by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin (Dr Daniel Amsterdam and Dr. S Stanley Schneierson), 101
Staphylococci (Penicillin-treated) : Streptomycin-induced Lysis of (Dr R. Hancock), 658
Staphylococcus aureus Isolation of a Phagocytosis-inhibiting Substance from Culture Filtrates of an Encapsulated (Dr. Stephen I. Morse), 102
Starch-gel Electrophoresis Separation of the α- and β-Chains of Globins by means of (C. J Muller), 643
Starch Gels : Broadening of the Water Proton Line in High-Resolution Nuclear Magnetic Resonance Spectra of (Dr. Roger Collison and Dr. M P McDonald), 548
Starch—Agar-Gel Electrophoresis of Tuberculoproteins from Heated Culture Filtrates (T. P. Dekker), 392
Starlings : Radar 'Ring Angels' and the Roosting Movements of (E. Eastwood, G. A. Isted and G. C. Rider), 112
Starr, Dr. Kenneth W. : Biological Equilibria in Human Cancer, 1006
Starr, Mortimer P., and others (edited by) : Annual Review of Microbiology, Vol. 13, *review* by Dr. B A. Newton, 49
Stars : Existence of Net Electric Charges on (Prof. V. A Bailey), 508
  Man's Conquest of the (Pierre Rousseau), *review* by D. H. P Jones, 69
State A Monte Carlo Equation of, for Mixtures of Hard-Sphere Molecules (E. B. Smith and K. R. Lea), 714
State Scholarships and Commonwealth Co-operation, 935
States (New) : Science in the Advancement of (Weizmann Institute of Science International Conference on), 604
States (Steady) : Autocatalytic Particles and (Dr. Allan Campbell), 256
Statically Indeterminate Structures : A Treatise on, *review* by Prof. A. J.S. Pippard, 582
Statistical Methods in Biological and Medical Sciences, *review* by R. M. Cormack, 746
Statistical Methods in Biology (Dr. Norman T. J. Bailey), *review* by R. M. Cormack, 746
Statistical Review (Registrar General), Part 2, Tables, Population, 765
Statistical Society (Royal) : Election of Officers, 1020
Statistical Test of Significance : Earthquakes and Uranus—Misuse of a (E J. Burr), 336 ; (Prof. R. Tomaschek), 337
Statistics at University College, London, 599
Statistics : Information Theory and (Prof. Solomon Kullback), *review* by Prof Colin Cherry, 506
  Probability and (Prof. Walter L. Smith), 338
Statistics (Elementary), with Applications in Medicine and the Biological Sciences (Prof Frederick E. Croxton), *review* by R. M. Cormack, 746
Statistics (United Kingdom Petroleum Industry), relating to Consumption and Refinery Production, 1958 and 1959 (Petroleum Information Bureau), 851
Status (Professional) : Higher National Certificates and, 123
Status and Development of the Teaching of Chemistry (Organization for European Economic Co-operation Seminar on the), 208
Statutory Bodies concerned with Scientific Research and Technical Services in the Federation of Rhodesia and Nyasaland : Government Organizations and, 202
Steady States : Autocatalytic Particles and (Dr. Allan Campbell), 256
Stearic Acid Molecules in Monolayers : Overturning of (George L. Gaines, jun.), 384
Stearic Acid Monolayers : Orientation of, on Silver Single Crystals (Robert T. Mathieson), 301
Stebbing, Prof. E P *Obituary* by Sir Harry Champion, 515
Steel, Prof. R. W. : The St. Lawrence Seaway, *review*, 110
Steel : Effect of Moisture on Carboxylic Acid Adsorption to (M. E. Schrader and J. L. Kalinsky), 710
Steer Hide : Liberation of Hexuronic Acid, Hexosamine and Hydroxyproline from, by Stem Bromelain (E. A. Botan and T B. Brother), 314
Stein, Dr G., and others . Mechanism of the Oxidation and Reduction of Metal Ions by Hydrogen Ions, 629
Stein, Prof. W. H. : Elected a member of the United States National Academy of Sciences, 773
Stein-Werblowsky, R. : Induction of a Chorion-epitheliomatous Tumour in the Rat, 980

Steiner, Dr R. E. : Sechzig Jahre Medizinische Radiologie, *review*, 921
Steinmann Medal of the Deutsche Geologische Vereinigung awarded to Prof H H Read, 206, 690
Stem Bromelain : Liberation of Hexuronic Acid, Hexosamine and Hydroxyproline from Steer Hide by (E. A. Botan and T. B Brother), 314
Stem Eelworm : A Spring Oat Variety resistant to the (T Glyn Davies), 813
Stengel, Prof. E. : Social Science, Criminology and Psychiatry, *review*, 41
Stenhouse, David The Redpoll in New Zealand—Interbreeding Subspecies, 488
Stephens, W. H : Sounding Rockets, *review*, 269
Stephenson, Prof. T. A., and Wareing, Prof. P. F : New Biology Building of the University College of Wales, Aberystwyth, 1021
Stereobalanus, a Genus New to the Old World (C Burdon-Jones and A. D. McIntyre), 491
Stereospecificity in Hydrolysis by Chymotrypsin : Requirements for—Diethyl β-Acetamidoglutarate (Prof. Saul G Cohen and Ezra Khedouri), 75
Steric Course of Microbiological Reactions (edited by G. E. W. Wolstenholme and Cecilia M. O'Connor), *review* by Prof. D. C. Harrison, 835
Sterilizing Doses of X-Rays : Divergence between Lethal Doses and, with Progressive Development in *Habrobracon* Females (Dr. Howard E. Erdman), 254
Stern, Prof. Curt A Mosaic of *Drosophila* consisting of 1X, 2X and 3X Tissue and its Probable Origin by Mitotic Non-disjunction, 179
Steroid Chemistry, *review* by Dr. W Klyne, 668
Steroids (Prof. Louis F. Fieser and Mary Fieser), *review* by Dr. W. Klyne, 668
Steroids (Hormonally Active) : A New Class of (Dr. E. H Reerick, H F. L. Scholer, P. Westerhof, A. Querido, A A H Kassenaar, E Diczfalusy and K C Tillinger), 168
Sterol Analysis by Gas Chromatography (R. K. Beerthuis and J. H. Recourt), 372
Sterols Ciba Foundation Symposium on the Biosynthesis of Terpenes and (edited by G. E. W Wolstenholme and Maeve O'Connor), *review* by Dr D T. Elmore, 745
Sterols and Terpenes, *review* by Dr. D. T. Elmore, 745
Stevens, Dr. B., and Hutton, E. : Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in Energy Transfer Processes, 1045
Stevens, Dr. I D. R. : Appointed lecturer in chemistry at the University of Southampton, 284
Stevenson, Dr. A. C Human Growth, 19
Stevin, Simon : The Principal Works of (edited by Prof. D. J. Struik), Vol. 2A, Mathematics , Vol 2B, Mathematics, *review* by Dr. J F. Scott, 60
Stevin's Mathematical Works, *review* by Dr J. F. Scott, 60
Steward, E G., and Cook, B P. Mosaic Texture of Graphites, 797
Stewart, C. M. : Detoxication during Secondary Growth in Plants, 374
Stewart, F. S., and Pearson, Dr. A. E G : Estimation of Mouse Tumour Blood Volumes employing a Radioactive Isotope Technique, 250
Stewart, J. E., and others Microquantitative Infra-Red Analysis—Application to Gas Chromatographic Fractions, 628
Stewart, N. G. : Appointed head of the Health Physics Division of the Atomic Energy Research Establishment, 933 ; work of, 933
Stewart, N. G. (Burton, W. M., and) : Use of Long-lived Natural Radioactivity as an Atmospheric Tracer, 584
Stewart, Sarah E., and others : Development of Resistance in Mice to Tumour Induction by S E Polyoma Virus, 615
Stilboestrol labelled with Carbon-14 . Enzymic Oxidation of (P H Jellinck), 157
Stiles, Prof W : Advances in Plant Physiology, *review*, 747
Still, Dr. C. J. : *Obituary* by Dr D Hamer, 848
Stimulating Effects of Nuclear Radiations on Development and Productivity of Rice Plants (Dr. Maung Mya Thaung), 982
Stimulation of Phagocytic Activity of the Reticulo-Endothelial System : Duration of, after Cessation of Treatment with Diethylstilboestrol (C. C. Ware and Prof. T Nicol), 974
Stimulation of Smooth Muscle by Adrenalin : Membrane Potential Changes associated with (G. Burnstock), 727
Stimulation (Dichotic), and Memory Disorder (Prof James Inglis), 181
Stimulation (Electrical) : Effect of, on a Muscle Fibre Model in the Presence of Adenosine Triphosphate (Prof. Masahiro Fujino, Tatsuaki Matsushima, Tomizo Muroya, Hideyo Yabu, Saburo Yamaguchi and Masaki Takahashi), 318
Stimulation (Vagal) or Acetylcholine Administration : Intracellular Potentials in Rat Atria during and after (P. A. Biersteker, J. Th. F. Boeles and L. N. Bouman), 637
Stjarne, L. (Bygdeman, M., and) : Effects of 1,4-Dihydrazinophthalazine on the Catechol Amines, 82
Stolk, Prof. A. : Cytoplasmic Inclusions of the Ageing Neurons of some Teleosts, 332

Stone, Prof. W. S.: Elected a member of the United States National Academy of Sciences, 773
Stoneley, Dr. R.: *Obituary* of Prof. B. Gutenberg, 433
Storage: The Theory of (Prof. P. A. P. Moran), *review* by D. G. Kendall, 344
Store: Food Losses in Field and (Nutrition Society Symposium on), 685
Stork, Prof G J.: Elected a member of the United States National Academy of Sciences, 773
Stormont, Prof. Clyde, and others: Bacterially Mediated False-Positive Reactions in Lytic Blood-Typing Tests, 247
Stour Estuary Mud Fauna of the (Frances Bull, Helen Honeyman and Susan Knott), 1018
Strachey, John: The End of Empire, 501
Strahlenbiologie—Grundlagen und Ergebnisse (Prof. Dr Hedi Fritz-Niggli), *review*, 66
Strain of Mouse: Influence of Route of Inoculation and, on Infectivity Titrations of the Virus of Foot-and-Mouth Disease (Wendy Heatley, H. H. Skinner and H. Subak-Sharpe), 909
Strain (Original), and Sub-line of the Ascites Tumour resistant to Alkylating Reagents Non-Protein Sulphydryl Group in the (Iwao Hirono), 1059
Strains (Pigment-producing), of *Acetobacter aceti* (J. G. Carr and J. L. Shimwell), 331
Strathy Bog Nature Reserve, 358
Stratified Flow (Thermally): Wind Profile in (W. C. Swinbank), 463
Stratigraphic Correlation: West-Pacific (Dr M. F. Glaessner), 1039
Stratigraphy of some Bottom Sections from the Central Pacific: On the (F. Brotzen and A Dinesen), (Reports of the Swedish Deep-Sea Expedition, 1947-48, Vol. 10, Special Investigations, No. 4), 609
Stratton, Dr. F.: World Distribution of ABO Blood Groups, *review*, 581
Stratton, Prof. F. J. M.: *Obituary* of Prof. S A. Mitchell, 200
Stratton, G. Burder (edited by). The Zoological Record, Vol. 93, Being the Records of Zoological Literature, relating chiefly to the Year 1956, *review* by Dr. Edward Hindle, 831
Streisinger, Dr. George Appointed associate professor of biology in the Institute of Molecular Biology at the University of Oregon, 681; work of, 681
Strength (Time-Dependent Tensile), of Solids (Dr C. C Hsiao), 535
Streptococci (Lactic): Heritable Changes in, induced by Physical Treatments (B. S. Gossling), 868
Streptomycin-induced Lysis of Penicillin-treated *Staphylococci* (Dr. R. Hancock), 658
Stress: Urinary Phenols in (R. Robinson and Dr. P Smith), 240
Stretch, K L.: Appointed vice-principal of the College of Advanced Technology, Birmingham, 12; work of, 12
Stretch, Roger G. A. Exploratory Behaviour in the Rat, 454
Stretching Frequencies (Metal-ligand), of some Metal Hydrazine Complexes: The 'Irving–Williams' Order in the (Prof L. Sacconi and A. Sabatini), 549
Strontium: Removal of, from Milk (Dr. Leon Singer and Dr. W. D. Armstrong), 484
Strontium-90 in Milk and Agricultural Materials in the United Kingdom, 1958-59 (Agricultural Research Council), 852
Strontium-90 in the 'Mixed Layer' of the Atlantic Ocean (Dr. Vaughan T. Bowen and Prof Thomas T Sugihara), 71
Strontium-90 Content of British Diet, 852
Structural Aspects (Physical and), of Non-destructive Testing of Metals (Non-destructive Testing Group of the Institute of Physics and the Société Française de Métallurgie Conference on), 284
Structural Lipoprotein of Rat Liver: Binding of a Hepatocarcinogen to the—its Bearing on the Immunological Theory of Cancer (J. W. Westrop and Prof H. N Green), 350
Structural Loading in Factories (Department of Scientific and Industrial Research), 851
Structural Resemblance (Slight), to Natural Bradykinin: Bradykinin Activity of some Synthetic Peptides with only (Dr. G. L. Tritsch and Prof. D. W. Woolley), 76
Structural Tool for the Chemist, *review* by Prof E. R. Andrew, 55
Structure of Bhilawanol (Dr. Bernard Loev), 389
Structure of Graphite and the Kinetics of its Reactions (Société de Chimie Physique Conference on), 284
Structure of High-Rank Coals deduced from Helium Densities (T. S. Polansky, H J. Donald and Prof. C. R. Kinney), 792
Structure of the Outer Secondary Wall on Unbleached Spruce Sulphite Fibres (O. Kallmes and J A S Newman), 566
Structure of a Periclinical Chromosomal Chimera of Apple: Changes in, following X-Irradiation (Charlotte Pratt), 255
Structure of the Upper Mantle as derived from the Travel Times of Seismic *P* and *S* Waves (Dr. I. Lehmann), 956
Structure of the Viscous Phase of Liquid Sulphur (Dr. E. McLaughlin), 76
Structure (Antigenic), of Non-Infectious Adenovirus Materials (Dr. H. G. Pereira), 571
Structure (Collagen): Reversible Transformation of Gelatin to the (Dr. Arthur Veis and Dr. Jerome Cohen), 720
Structure (Crystal), of Adenosine-5'-Phosphate (J. Kraut and L. H. Jensen), 798
Structure (Crystal), of Indanthrene: Electron Microscopy and the (Lewis T. Chadderton), 541
Structure (Crystal), of Mellitic Acid (S F. Darlow), 542
Structure (Crystal), of Potassium Trivanadate (Dr. Stanley Block), 540
Structure (Crystal), of Tetraphenyl*cyclo*butadiene Iron Carbonyl (R. P. Dodge and Dr V. Schomaker), 798
Structure (Crystal) Determination. Modern Methods of (Manchester College of Science and Technology Summer School in), 766
Structure (Electronic), of Molecules, *review* by Prof C. A Coulson, 54
Structure (Letter), of the English Language (A. D. Baddeley, R. Conrad and W. E. Thomson), 414
Structure (Microscopic), of some Wools. Anomalies in the (T. D. Brown and W J Onions), 93
Structure (Molecular) Effect of, upon Concentration of Hydrocarbons in 'Painted' Mouse Skin (Mary Burnham and Fred G. Bock), 323
Structure (Primary), of the Protein of Tobacco Mosaic Virus (F. A. Anderer, H. Uhlig, E. Weber and Prof. G. Schramm), 922
Structure (Ultra-) of the Clear Cells in Renal Carcinomas and its Importance for the Demonstration of their Renal Origin (Prof Ch. Oberling, M. Rivière and Fr. Haguenau), 402
Structure (Ultra-) of Human Amnion and its Possible Relation to the Circulation of Amniotic Fluid (Dr. Gordon L. Bourne and Dr. Dennis Lacy), 952
Structure and Function: Protein (Brookhaven National Laboratory thirteenth Symposium in Biology), 361
Structure and Function of Genetic Elements—Report of Symposium held June 1959 (Brookhaven Symposia in Biology, No. 12), *review* by Prof. S C. Harland, 63
Structure and Growth of Plant Cell-Walls, *review* by Prof. R. D. Preston, 920
Structure, Shape and Function of a Salivary Mucoprotein: Correlation between Composition, (Dr. Alfred Gottschalk), 949
Structures: Hyperstatic (Prof J. A. L. Matheson), Vol. 1, *review* by Prof A. J. S. Pippard, 582
  A Treatise on Statically Indeterminate, *review* by Prof. A. J. S. Pippard, 582
Structures corresponding to Terminal Bars and Terminal Web in Many Types of Cells (Prof. C. P. Leblond, Holde Puchtler and Y. Clermont), 784
Structures (Cylindrical): Electromagnetic Radiation from (James R. Wait), *review* by W. Brown, 583
Structures (Filamentous), in Ectromelia Virus-Infected Cells (Dr. Benjamin V. Siegel), 820
Struik, Prof. D J (edited by): The Principal Works of Simon Stevin, Vol. 2A, Mathematics; Vol. 2B, Mathematics, *review* by Dr. J. F. Scott, 60
Stuart, Dr K. L: Medical Research in the British Caribbean (Hypertension in Jamaica and St. Kitts), 862
Student's Introduction to Physics (Franklin Miller, Jr), *review* by T. M. Yarwood, 68
Students, National Union of Memorandum to the University Grants Committee on the Expansion of University Education (1960-1970), 687
Students (Postgraduate): The Training of, 915
Students (University): The Needs of, 687
Studentships and Fellowships (Agricultural Research Council), 126
Studies (Business): The Future Development of Management Education and of—Revision of Joint Examination Schemes (Ministry of Education, Circular 1/60), 743
  Management, Education and, 743
Studies (Comparative), of Yeasts (J. A. Barnett), 449
Studies (Economic), concerning Africa South of the Sahara: Inventory of—an Annotated Reading List of Books, Articles and Official Publications (edited by Peter Ady), (Commission for Technical Co-operation in Africa South of the Sahara, CSA/CCTA Publication No 30, Joint Project No. 4), 202
Studies (Genetical and Biochemical), of the Immobilization Antigens of *Paramecium aurelia* (J. O Bishop and Dr. G H. Beale), 734
Studies (Histochemical and Biochemical), of Rat Liver in Experimental Cirrhosis after Partial Hepatectomy (I. Bartók, Gy Domján, R. Horváth and Prof. B. Korpássy), 397
Studies (Management): Report of the Working Party appointed to examine the Scheme of (Ministry of Education, Appendix to Circular 1/60), 743
Studies (Radio), of the Universe (Dr. R. D. Davies and Dr. H. P. Palmer), *review* by Dr. J. S. Hey, 59
Studies (X-Ray), of some Carbonized Coals (R. Diamond and P. B. Hirsch), 204
Study of Chemical Thermodynamics An Introduction to the (Prof. D. H. Everett), *review* by Prof A. R. Ubbelohde, 55
Study of Chromosomes in Man: A Simplified Method for the (C. Bottura and I Ferrari), 904
Study of Human Biology, Society for the: Symposium on Human Growth, 19
Study of Man (Prof. Michael Polanyi), *review* by F I G. Rawlins, 347
Study of the Oxidation of Hindered Phenols by Electron Spin Resonance (Dr. J. E. Bennett), 385
Study (Histophotometrical), of the Effect of Interstitial Cell-stimulating Hormone on the Deoxyribonucleic Acid Content of the Testicular Interstitial Cell Nucleus in the Adult Rat (S L. Liu), 475
Study (A Synoptic), of Infra-red Radiation over the United States (Dr. John L. Gergen and Dr. William F. Huch), 426, *erratum*, 604
Study (X-Ray Diffraction), of Denatured Ferritin and Apoferritin (Vladimir Kleinwachter), 313
Study Group on the Mental Health Problems of Automation (World Health Organization, Report Series No. 183), 364
Studying the Quantitative Aspects of Cytochemical Reactions: A New Technique for, and its Application to the Feulgen Reaction (P. van Duijn and J. P. Persijn), 805
Stunkard, Dr. Albert J., and others: Improvement of the Intravenous Glucose Tolerance Test, 808
Sturgeon, Dr. R J.: Appointed to the Biochemistry Section of Twyford Laboratories, Ltd, London, 523
Sub-aquatic Medicine (Club Alpin Sous-Marin International Colloquium on), 440
Sub-line (Original Strain and), of the Ascites Tumour resistant to Alkylating Reagents: Non-Protein Sulphydryl Group in the (Iwao Hirono), 1059
Sub-normal Level of Carbonic Anhydrase in Blood of Carcinoma Patients? (Dr N. W H. Addink), 253
Sub-Zero Temperatures. Effect of, on Diapause Eggs of *Acheta commodus* (Walk), (T. W. Hogan), 98
Subak-Sharpe, H, and others: Influence of Route of Inoculation and Strain of Mouse on Infectivity Titrations of the Virus of Foot-and-Mouth Disease, 909
Substances with Gibberellin-like Biological Properties: Distribution and Prevalence of *Fusarium moniliforme* Sheld (*Gibberella fujikuroi* (Saw.) Wr) producing (Prof W. L. Gordon), 698
Substances (Gibberellin-like), in Lettuce Seed: Presence of (Dr. S. Blumenthal-Goldschmidt and Prof. A. Lang), 815
Substances (Pure) Paper Chromatography—Multiple Spot Formation by (Dr A. H. Beckett, M. A. Beaven and Dr. Ann E. Robinson), 775
Substitutes (Indian), of Male Fern in Pharmacognosy (Prof. P. N. Mehra and T. C. Mittal), 722
Substrate: Accumulation of, by Isolated Rat Diaphragm—a Possible Mechanism for the Anti-Inflammatory Action of Corticosteroids (Prof. Ira G. Wool), 728

Substrates and Inhibitors (Chymotrypsin) Inhibition of the Anaphylactic Release of Histamine from Chopped Guinea Pig Lung by (Dr. K. F. Austen and Dr. W. E. Brocklehurst), 866
Succinate, Adenine Nucleotides and Thyroxine Swelling of Fresh and Aged Liver Mitochondria as affected by (Dr. P. Emmelot, C. J. Bos, P. J. Brombacher and I H. M Reyers), 556
Succinate Oxidation (α-Ketogluratate and), in E-Deficient Liver Homogenates · Maintenance of, by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr Laurence M. Corwin and Dr Klaus Schwarz), 1048
Suffolk Archaeology in (N Smedley), 770
Suffolk Flora · Changes in the, during the Past 100 Years (F. W Simpson), 771
Suffolk Naturalists' Society Transactions, Vol 11, Part 3, Mud Fauna of the Stour Estuary (Frances Bull, Helen Honeyman and Susan Knott), 1018
Suffolk Ponds and Pond Animals (J. E. Marston), 771
Suffredini, C S, and others Abundances of the Rare-Earth Elements, Lanthanum to Lutetium, in Chondritic Meteorites, 863
Sugars (3-Deoxy) . Estimation of, By means of the Malonaldehyde–Thiobarbituric Acid Reaction (Dr. Morris A. Cynkin and Dr. Gilbert Ashwell), 155
Sugars (Deoxy), and Sialic Acids Thiobarbituric Acid Spray Reagent for (Dr. Leonard Warren), 237
Sugihara, Prof Thomas T. (Bowen, Dr. Vaughan T, and) : Strontium-90 in the 'Mixed Layer' of the Atlantic Ocean, 71
Sugiura, S (Nakahira, Dr. M, and) A Regular Mixed-Layer Chlorite–Vermiculite Mineral, 877
Suitability of the General Certificate of Education Advanced Level Syllabuses in Science as a Preparation for Direct Entry into First Degree Courses in the Faculty of Science . Report of an Enquiry into the (University of Birmingham), 687
Sujak, Dr. B (Wawrzyniak, J, and) · Photostimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide, 467
Sullivan, T J . Effect of Manganese Edetate on Blood Formation in Rats, 87
Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methylisothiazole), a New Antibacterial Sulphonamide (A Adams, W. A. Freeman, A. Holland, D Hossack, J. Inglis, J. Parkinson, H. W. Reading, K Rivett, R. Slack, R Sutherland and R Wren), 221
Sulphate : A Modification for Washing the Benzidine Sulphate Precipitate in the Determination of (Dr. I. P. T. Hakkinen), 232
Sulphate in Tidal Swamp Soils from Sierra Leone Sea-Water as the Primary Source of (J C D Watts), 308
Sulphate (Benzidine) Precipitate : A Modification for Washing the, in the Determination of Sulphate (Dr I P. T. Hakkinen), 232
Sulphate (Peroxy Titanium) : Nature of the Colour-forming Species in (Dr C C Patel and M. S Mohan), 803
Sulphate (Zinc) Treatment of Parakeratosis in Cattle (S P. Legg and L. Sears), 1061
Sulphates (Isomeric Chondroitin) Identification of (J B Adams), 555
Sulphite Fibres (Spruce) : Structure of the Outer Secondary Wall on Unbleached (O Kallmes and J. A Newman), 566
Sulphonamide (Antibacterial) . Sulphasomizole (5-*p*-Aminobenzenesulphonamido-3-methylisothiazole), a New (A. Adams, W. A. Freeman, A. Holland, D. Hossack, J. Inglis, J. Parkinson, H. W. Reading, K. Rivett, R. Slack, R. Sutherland and R. Wren), 221
Sulphonated Polystyrene Resin : Behaviour of some Aldehydes on a (Dr S. A. Barker, K Murray and Prof. M. Stacey), 469
Sulphoxide ((+) S-Methyl-L-Cysteine), an Inhibitor of Aspartic Acid Utilization in *Leuconostoc mesenteroides* (Wilfred N Arnold, Clayton J. Morris and John F Thompson), 1051
Sulphur Aspects of the Organic Chemistry of (Prof. Frederick Challenger), *review* by Dr. F G Mann, 53
  The Organic Chemistry of, *review* by Dr F G. Mann, 53
Sulphur-35 : Release of Methionine labelled with, from Muscle Tissue and Mitochondria (Dr. R. Zák and Dr. Z. Drahota), 973
Sulphur Compounds The Metabolism of (Leslie Young and George A. Maw), *review* by Dr. G. D. Greville, 424
Sulphur Deposits (Coloured), at Low Temperatures (Dr. B Meyer and Prof E. Schumacher), 801
Sulphur (Liquid) . Structure of the Viscous Phase of (Dr. E. McLaughlin), 76
Sulphydryl Compounds : Effect of Oxygen on the Radiosensitivity of Bacteriophage in the Presence of (Dr. P. Howard-Flanders), 485
Sulphydryl Compounds in Rat Liver : Level of, following Feeding with Goitrogenous and Non-goitrogenous Cabbage (Jozef Sedlák), 892
Sulphydryl Content of the Embryos of the Australian Cattle Tick (W. J. Roulston and C. A. Schuntner), 1069
Sulphydryl Group (Non-Protein), in the Original Strain and Sub-line of the Ascites Tumour resistant to Alkylating Reagents (Iwao Hirono), 1059
Summer Laboratory Course in Techniques and Applications of the Electron Microscope (Cornell University), 127
Sumner, Dr. W L. : Sixth-Form Science as a Preparation for University Work, 686
Sun : Density of the Upper Atmosphere and its Dependence on the, as revealed by Satellite Orbits (D. G. King-Hele and D. M. C. Walker), 928
Sun and its Influence (Prof M. A Ellison), second edition, *review* by Prof C. W. Allen, 69
Sunspot Number in 1968 . An Estimate of the Peak (C. M. Minnis), 462
Superconductivity : Methodology and, *review* by Dr. C. G Kuper, 833
  A New Method in the Theory of (N. N. Bogoliubov, V. V Tolmachev and D V Shirkov), translated from the Russian, *review* by Dr. C. G. Kuper, 833
Supercontraction of Wool Fibres and Creep in the Post-yield Region (Dr. K. J. Whiteley), 473
Supercooled Liquids Reduced Temperatures for Nucleation in (Dr. E. R. Buckle), 875
Supercooled Salol Ultrasonic Propagation Constants in (Dr. S. Parthasarathy and V. N. Bindal), 145
Superficial Chemistry and Solid Imperfections (Prof. F. C. Tompkins), 3
Superior Galactic Communities . Communications from (Prof. R. N. Bracewell), 670
Supernatant Potassium-Level : Effect of, on Cardiac Activity in Quantitative Tissue Culture (Prof A. W. B Cunningham, K Kleutch and W Herbst), 241
Supersonic Flow (Unsteady) The Potential Theory of (Prof. John W. Miles), *review* by L E Fraenkel, 505
Supply, Ministry of Technical Note No. *A.D* W.6, Making of Models of Aircraft with shells consisting of 'Araldite' Glasscloth Laminate, 360

Theory of Compressible Flow : Introduction to the (Prof Shih-I Pai), *review* by Dr. G K. Batchelor, 1000

Theory of Dams, *review* by D. G. Kendall, 344

Theory of Relativity : Analysis of Accelerated Motion in the (Robert T. Jones), 790

Theory of Storage (Prof. P. A. P. Moran), *review* by D. G. Kendall, 344

Theory of Superconductivity : A New Method in the (N. N. Bogoliubov, V. V. Tolmachev and D. V. Shirkov), translated from the Russian, *review* by Dr C. G. Kuper, 833

Theory (Immunological), of Cancer . Binding of a Hepatocarcinogen to the Structural Lipoprotein of Rat Liver—its Bearing on the (J. W. Westrop and Prof. H. N. Green), 350

Theory (Information), and Statistics (Prof. Solomon Kullback), *review* by Prof. Colin Cherry, 506

Theory (Learning) · 60 Years of, *review* by Prof. K. R. L. Hall, 40

Theory (Non-Equilibrium), of Gas–Liquid Chromatography (Dr. M. A. Khan), 800

Theory (Nuclear) · Introductory (Dr. L. R. B. Elton), *review* by Dr. T. E. Allibone, 917
  Lectures on (L. D. Landau and Ya Smorodinsky), translated from the Russian, revised edition, *review* by Dr. T E. Allibone, 917

Theory (Nuclear), and its Utilization, *review* by Dr. T. E. Allibone, 917

Theory (The Potential), of Unsteady Supersonic Flow (Prof. John W. Miles), *review* by L. E. Fraenkel, 505

Theory (Quantum), for the Scholar, *review* by Prof N. Kemmer, 999

Theory and Practice of Sedimentation, *review* by Dr K. V. Shooter, 56

Thermal Conductivity Detectors · Effect of Carrier Gas on the Sensitivity of (C. Bokhoven and A. Dijkstra), 793

Thermal Motion in Crystals and Molecules (International Union of Crystallography Symposium on), 1020

Thermal Syndicate, Ltd · Grant of £1,200 a year to the Houldsworth School of Applied Science in the University of Leeds, to establish a research fellowship in ceramics, 767

Thermally Stratified Flow : Wind Profile in (W. C. Swinbank), 463

Thermodynamical Relations in Two-Component Two-Phase Systems (Prof. H. Kaufman), 299

Thermodynamics : Chemical, *review* by Prof A. R Ubbelohde, 55

Thermodynamics (Chemical) : An Introduction to the Study of (Prof. D. H. Everett), *review* by Prof A. R. Ubbelohde, 55

Thermodynamics and Kinetics of Spontaneous Generation (Dr D. E. Hull), 693 , (Prof J D. Bernal), 694

Thermodynamique Chimique · Bases Fondamentales et Applications de la (Prof Maurice Dodé), Tome I, Les Principes, les Systèmes Ideaux Gazeux, et avec Phases Condensées pures, *review* by Prof. A. R. Ubbelohde, 55

Thermoelectric Cold Box : A Commercial (General Electric Co., Ltd.) 439

Thermonuclear Reactions (Controlled) : Bibliography on Plasma Physics and Magnetohydrodynamics and their Applications to (J. D. Ramer), 522

Thermonuclear Research An Introduction to (Albert Simon), *review* by Dr T. E. Allibone, 917

'Theta' Pinch : 'Prize', a Pre-ionized (R. D. Medford, A. L. T. Powell, J. D Herbert, R C. Pottinger and J K. Wright), 706

Thienpont, D., and others Isolation of a Cytopathogenic Agent from Skin Lesions in Cattle, 979
Thin Films of Silver–Cadmium Alloy (K. Bahadur and P. V Sastry), 467
Thin (Ultra-) Sections Water-Soluble Methacrylates as Embedding Media for Preparation of (Dr O. Wichterle, Dr. P. Bartl and Dr. M Rosenberg), 494
Thines, Dr. G. : Sensory Specializations in Response to Environmenta Demands (Sensory Degeneration and Survival in Cave Animals), 689
Thinking in Examinations The Lack of (Dr. Margaret Sutherland), 607
Thiobarbituric Acid Spray Reagent for Deoxy Sugars and Sialic Acids (Dr. Leonard Warren), 237
Thiol and Disulphide Groups : A Role for, in Determining the Rheological Properties of Dough made from Wheaten Flour (R. Frater, Dr F. J. R. Hird, H. J. Moss and J. R. Yates), 451
Thiotaurine : Inability of, to protect Mice against Ionizing Radiation (Dr. D Cavallini and L. Tentori), 254
Third Component of Complement · Further Evidence for the Dual Nature of the (Dr J D. Hawkins), 483
Thirring, Walter E. Principles of Quantum Electrodynamics (translated from the German by J. Bernstein), *review* by Prof N. Kemmer, 999

Total Acoustic Radiation Impedance of Rigid Pistons in an Array : Measurements of the (J. S. M Rusby), 144
Tousey, Dr. R N. : Elected a member of the United States National Academy of Sciences, 773
Toussaint, F (Fripiat, Dr. J. J , and) : Predehydroxylation State of Kaolinite, 627
Townsend, Dr A. A. Elected a Fellow of the Royal Society, 12
Toxicity of Ovicides to Eggs of the Red Spider Mite, *Tetranychus telarius* (L.) (Acarina : Tetranychidae) : Effect of Relative Humidity on Hatching and on (R A Harrison and A G. Smith), 409
Toxicity (Manganese), in *Grevillea robusta* (Dr R. Child and A N. Smith), 1067
Toxicology : Handbook of, Vol 5, Fungicides (analysis and compilation by Everett F. Davis, Barbara L. Tuma and Lucy C Lee), edited by Dorothy S Dittmer, *review*, 64
Toxin (Ackee), a Riboflavin Antimetabolite ? (H C. Fox and D S. Miller), 561
Toxin (Facial Eczema), Sporidesmin Detection and Estimation of a (G. R. Russell), 788
Trace Analysis by X-Ray Fluorescence using Ion Exchange Resins (J N. van Niekerk and J. F. de Wet), 380
Trace Element Effect in Alloys based on the Aluminium–Zinc–Magnesium System (I. J. Polmear), 303
Tracer (Atmospheric) : Use of Long-lived Natural Radioactivity as an (W. M Burton and N. G Stewart), 584
Trachoma, Inclusion Blennorrhoea and Lymphogranuloma : Transmission of the Viruses of, to Mice (Dr E. Weston Hurst and P. Reeve), 336
Trade Effluents : Water Pollution by, 210
Trade Effluents Sub-Committee of the Central Advisory Water Committee Final Report (Ministry of Housing and Local Government), 210
Traffic Accidents and Driver Characteristics (Sauli Hakkinen), 273
Trail Award and Medal of the Linnean Society of London presented to Dr. Lawrence Ernest Rowland Picken, 766
Traill, R. C : Addition Compounds between Copper Complexes and Organic Bases, 631
Training in Chemical Engineering Education and (Supplement to Chemical Engineering, a Career), (Institution of Chemical Engineers), 125
Training in Monkeys : Cross-Modal Transfer of (D. Burton and Dr. G. Ettlinger), 1071
Training of Postgraduate Students, 915
Training of Teachers for Technical Colleges : The Supply and (Ministry of Education), 185
Training of Technical Teachers (Northern Advisory Council on Further Education), 281
Training (Apprenticeship), in Britain, 436
Training (The Postgraduate), of Physicists in British Universities—the Report of a Joint Committee appointed by the Institute of Physics and the Physical Society, 915
Training Council, Industrial . First Report (1958–59), 15
  Training Services in Industry, 123
Training Grants (Postgraduate), in Fishery Research (Development Commissioners, the Ministry of Agriculture, Fisheries and Food, and the Scottish Home Department), 360
Training Services in Industry (Industrial Training Council), 123
Trametes cingulata Berk : Nuclear Phenomena in (Pritindra Mohan Naha), 903
Transaminases in Serum · Measurement of (Dr H. Yatzidis), 79
Transfer (Charge) · Detection of Negative Ions formed by (T. M. Donahue and F. Hushfar), 1038
Transfer (Cross-Modal), of Training in Monkeys (D. Burton and Dr. G. Ettlinger), 1071
Transfer Processes (Energy) . Radiative Life-time of the Pyrene Dimer and the Possible Role of Excited Dimers in (Dr B Stevens and E. Hutton), 1045
Transfer Reactions (Electron), involving *s*-Trinitrobenzene (Dr. R. E. Miller and Prof. W. F K. Wynne-Jones), 149
Transformation (Reversible), of Gelatin to the Collagen Structure (Dr. Arthur Veis and Dr. Jerome Cohen), 720
Transformations (Allotropic), in Plutonium (J. D. Hill), 304
Transformations (High-Pressure Phase), in Laboratory Mechanical Mixers and Mortars (Frank Dachille and Prof. Rustum Roy), 34
Transistor Modulators for Low-level Direct Current Signals (J. F. Evans), 626
Transistorized Computer . A New British (General Electric Co., and International Computers and Tabulators, Ltd.), 936
Transition Metal Ions : Heats and Entropies of Reaction of, with Ethylenediamine (M. Ciampolini, P Paoletti and Prof L. Sacconi), 880
Transition Temperature : The Delta Plutonium (Dr R. G. Cope), 539
Translation Dictionary . Russian Machine (H. S. H. Massey), 852
Translocation (Concurrent) : Evidence of (C. D. Nelson, H. J Perkins and P. R Gorham), 205
Transmission of the Viruses of Trachoma, Inclusion Blennorrhoea and Lymphogranuloma to Mice (Dr. E. Weston Hurst and P. Reeve), 336
Transmission (Neuro-Muscular), in the Earthworm (Dr. G A. Horridge and Dr. M. B V. Roberts), 650
Transmissions from Fast Spinning Satellites · Faraday Effect in the (R. S Roger and J H Thomson), 622
Transplantation and Tolerance : Antigens, *review* by Dr. D. M. V. Parrott, 51
Transport (Active), of γ-Aminobutyric Acid in Brain Cortex Slices, with special reference to Phosphorus-32 Turnover in Phospholipids in Cytoplasmic Particulates (Yasuzo Tsukada, Yutaka Nagata and Shusuke Hirano), 474
Transvaal Museum *Bulletin* of the, No. 4, 936
  Annals of the, Vol 14, Part 1, 936
Travel Scholarship : Bowles Memorial (Royal Horticultural Society), 206
Travel Times of Seismic *P* and *S* Waves Structure of the Upper Mantle as derived from the (Dr. I. Lehmann), 956
Travelling Research Fellowships · Carlsberg–Wellcome (Wellcome Trust), 283
Treatment of Depression by Drugs and other Means (Dr Linford Rees), 114
Treatment with Diethylstilboestrol Duration of Stimulation of Phagocytic Activity of the Reticulo-Endothelial System after Cessation of (C. C. Ware and Prof. T. Nicol), 974
Treatment of Injured and Regenerating Muscles with Plant Extracts (S. Hoja and J. Vittek), 283
Treatment of Tumours in Animals and Man · Actinomycins and their Importance in the (New York Academy of Sciences Conference on), 771
Treatment (Colchicine), and Polyspermy · Triploid Rat Embryos and other Chromosomal Deviants after (L Piko and O. Bomsel-Helmreich), 737
Treatment (Zinc Sulphate), of Parakeratosis in Cattle (S. P. Legg and L. Sears), 1061
Treatments (Physical) · Heritable Changes in Lactic Streptococci induced by (B S. Gossling), 868
Trebst, Dr A V , and others Equivalence of Light and Adenosine Triphosphate in Bacterial Photosynthesis, 753
Trehalose Metabolism of Trypanosomes (Dr. David Weinman), 166
Treiman, Prof S. B. · Elected to an Overseas Fellowship of Churchill College, Cambridge, 440
Trematodes in a Snail . Multiple Infections of (Wm H Ewers), 990
Trends in Medicine A Diversity of, *review* by Prof. L. J Witts, 42
Trends (Modern), in Enzymology, *review* by Prof J. Brachet, 267
Trends (Significant), in Medical Research · Ciba Foundation Symposium on (edited by G. E W. Wolstenholme, Cecilia O'Connor and Maeve O'Connor), *review* by Prof. L. J. Witts, 42

  - Appointment of H. Sutcliffe to a senior lectureship in electrical engineering, 284
  - Appointment of J. S. Cooper as lecturer in prosthetics, 284
  - Grant of £25,000 from the Research Grants Advisory Panel of NATO to the Department of Physics, for the support of an international expedition to the central Mediterranean, 284
  - Grant of £6,500 from the Department of Scientific and Industrial Research to the Department of Physics, in connexion with an investigation of high-altitude flight and recovery techniques in the Mediterranean region, 284
  - Grant of £1,600 from the Department of Scientific and Industrial Research to the Department of Organic Chemistry, for an investigation into the structure and synthesis of natural products, 284
  - Grant of £2,200 from the Department of Scientific and Industrial Research to the Department of Physics, towards research on the study of fragmentation of heavy cosmic ray nuclei in hydrogen and carbon, 284
  - Grant of £2,000 from the Nuffield Foundation to the Department of Surgery, for work on vascular disease, 284
  - Grant of £1,250 per annum for two years from Roche Products Ltd., to the Department of Organic Chemistry, for the establishment of a Roche fellowship for research work, 284
  - Appointment of Dr. P. G. Drazin as lecturer in mathematics, 937
  - Appointment of Dr A. E. Scott as lecturer in chemistry, 937
  - Appointment of J. K. Whitaker as lecturer in mathematical economics, 937
  - Appointment of K. F. H Murrell as a Research Fellow in the Department of Psychology, 937
  - Election of Dr. D. H. Perkins as reader in physics, 937
- University of Cambridge : Retirement of Prof. G. E Briggs from the professorship of botany, 356
  - Appointment of Dr H Godwin as professor of botany, 356
  - Election of Dr. F. H Hahn to Official Fellowship, and College lecturer in economics to Churchill College, 440
  - Election of Dr. D. J. Thouless to Official Fellowship, and College lecturer in mathematics to Churchill College. 440
  - Election of Dr F H. C. Crick to an Extraordinary Fellowship of Churchill College, 440
  - Election of Prof. S. B Treiman to an Overseas Fellowship of Churchill College, 440
  - Modification of Matriculation requirements, 603
  - Retirement of Prof E. B. Moullin from the chair of electrical engineering, 680
  - Appointment of Prof C. W Oatley to the chair of electrical engineering, 680
  - Election of Prof A. B Pippard to the John Humphrey Plummer professorship of experimental physics, 762
- University of Chicago . Appointment of Prof M. J. S Dewar to the chair of organic chemistry, 762
- University of Colorado, Boulder : Appointment of Prof Oswald Tippo as provost, 1020
- University of Durham · Appointment of Prof D G. Christopherson as Warden of the Durham Colleges, 604
  - Appointment of Dr O. E W R. Kurth as senior lecturer in mathematics, 937
  - Appointment of D J. Bellamy as lecturer in botany, 937
  - Appointment of Dr R D. Chambers as lecturer in chemistry, 937
  - Appointment of Dr D P. Hendry as lecturer in psychology, 937
  - Appointment of Dr. D M. Hirst as lecturer in geochemistry, 937
  - Appointment of Dr M J. Morant as lecturer in applied physics, 937
  - Retirement of Prof Meirion Thomas from the chair of botany at King's College, Newcastle-upon-Tyne, 1016
- University of Edinburgh : Institution of a chair of electrical engineering, 522
  - Science and Mathematics Texts, No. 2, The Antecedents of Man (Prof. Sir Wilfrid E. Le Gros Clark), *review* by Dr. G G. Simpson, 665
  - Appointment of Dr J L. Holmes, Dr. K. R. Jennings, Dr. G R. H. Jones, Dr. A. J Charlson and Dr. J. W. Sutherland as I.C.I Research Fellows, 767
  - Appointment of M. J. O'Hara as lecturer in geology, 767
  - Appointment of E. R. S. Fifoot as University librarian, 767
- University of Hawaii, and others : Tenth Pacific Science Congress of the Pacific Science Association, 604
- University of Illinois : Appontment of Prof. Theodore Delevoryas as associate professor in the Department of Botany, 1020

University of Leeds . Appointment of Dr. D. R Woods to the chair of pharmacology, 121
  Annual Report of the Librarian for the Session 1958-59, 126
  Appointment of Prof. J. Nutting to the chair of metallurgy, 201
  Appointment of W. G. Collins and J. A. Fox as lecturers in civil engineering, 767
  Appointment of Dr. C. M. Reeves as lecturer in electronic computing, 767
  Appointment of C G Woods as lecturer in pathology, 767
  Appointment of Dr P. J. Wyllie as lecturer in experimental petrology, 767
  Portsmouth fellowship for research in multiple sclerosis awarded to Dr. D M. Robertson, 767
  Grant of £2,055 from the Department of Scientific and Industrial Research to the Department of Zoology, for research projects under the direction of Dr. Broadhead, 767
  Grant of 152,517 dollars from the United States Public Health Authority to the Department of Biomolecular Structure, 767
  Grant of £1,100 from the Medical Research Council to the Department of Biomolecular Structure, to establish a research fellowship, 767
  Grant of £3,500 from the British Coke Research Association to the Houldsworth School of Applied Science, 767
  Grant of £1,200 a year from the Thermal Syndicate, Ltd , to the Houldsworth School of Applied Science, to establish a research fellowship in ceramics, 767
University of Liverpool : Appointment of Prof. J M Cassels to the Lyon Jones chair of physics, 201
  New Laboratories at the, 844

  H M Queen Elizabeth the Queen Mother to open the Brunswick Square building of the School of Pharmacy, 284
  Grant of £120,000 from the Wellcome Trust to King's College, towards the purchase of the lease of premises to house a Department of Biophysics, 439
  Grant of £30,000 from the Wellcome Trust to University College, to build and furnish a research unit in cellular immunity as an annexe to the Department of Zoology, 439
  Grant of £2,500 per annum for up to 5 years from the Wellcome Trust to St Mary's Hospital Medical School, to provide technical assistance and research expenses for work on the physiology of pre-natal growth, 439
  Appointment of Dr E. H. Bellamy to the University chair of physics at Westfield College, 440
  Appointment of Dr E. H Sondheimer to the University chair of mathematics at Westfield College, 440
  Appointment of Dr. G E. Fogg to the University chair of botany at Westfield College, 440
  Appointment of Dr K. W Cross to the University chair of physiology in London Hospital Medical College, 522, 598
  Appointment of Dr. B C. L. Weedon to the University chair of organic chemistry in Queen Mary College, 522, 762
  Appointment of Dr. D V. Ager to the University readership in geology at the Imperial College of Science and Technology, 522
  Title of reader in the history and philosophy of science in the University (at University College) conferred on Dr. N. H. de V. Heathcote, 522
  Election of Sir Harold Roxbee Cox, Prof. C W. Dannatt, Prof. F. G. Gregory, G C. Lowry and Sir William Pugh to Fellowships of the Imperial College of Science and Technology, 522
  Retirement of Prof E. S Pearson from the chair of statistics in University College, 599
  Appointment of Prof M S Bartlett to the chair of statistics in University College, 599
  Dinner to be held in honour of F Howarth, on his retirement from the Botany Department of the Imperial College of Science and Technology, 604
  Appointment of Prof. M. J S Dewar (Queen Mary College) to the chair of organic chemistry in the University of Chicago, 762
  Optical Design Group to be set up at the Imperial College of Science and Technology under the direction of Dr. C G Wynne, with the support of a grant of £9,400 a year from the Department of Scientific and Industrial Research, 934
  Appointment of Dr W Klyne to the University chair of chemistry at Westfield College, 938
  Appointment of Dr. R E. O Williams to the University chair of bacteriology at St. Mary's Hospital Medical School, 938, 1016
  Appointment of Dr. J. H. Green as reader in physiology at Middlesex Hospital Medical School, 938
  Appointment of Dr H. J J Blackwood as reader in oral anatomy at the Royal Dental Hospital of London School of Dental Surgery, 938
  Appointment of J C. de C. Henderson as reader in reinforced concrete structures at the Imperial College of Science and Technology, 938
  Appointment of A. J. Buller as reader in physiology at King's College, 938
  Appointment of Dr H Harris to the University chair of biochemistry at King's College, 1020
  Appointment of A. F Huxley to the Jodrell chair of physiology at University College, 1020
  Course of Lectures in Reactor Fuel Element Technology at the Imperial College of Science and Technology, 1025
University of Manchester : Cost of the Radio Telescope at Jodrell Bank, 13
  Annual Report of the Manchester Museum for 1958-59, 521
  Appointment of Dr. John Colhoun to the chair of cryptogamic botany, 598
  Summer School in Modern Methods of Crystal Structure Determination at the Manchester College of Science and Technology, 766
  Retirement of Prof. H Wright Baker from the chair of mechanical engineering, 1015
  Appointment of W Johnson to the chair of mechanical engineering, 1015
University of Maryland : Bibliography on Plasma Physics and Magnetohydrodynamics and their Applications to Controlled Thermonuclear Reactions (J. D. Ramer), 522
  Grant of 216,000 dollars from the United States National Aeronautics and Space Administration, to accelerate its programme of basic research dealing with the growth and metabolism of unicellular algae, 604
University of Milan . Symposium on Drugs affecting Lipid Metabolism, 127
University of New South Wales . Appointment of Dr S J. Angyal to the chair of organic chemistry, 357
University of Nottingham Appointment of Dr Cyril Clifford Addison as professor of inorganic chemistry, 767
  Appointment of Dr Maurice William Partridge to the Lord Trent chair of pharmaceutical chemistry, 767
  Appointment of Dr. R Edgeworth Johnstone as the first Lady Trent professor of chemical engineering, 933
University of Oregon Appointment of Dr. George Streisinger as associate professor of biology in the Institute of Molecular Biology, 681
University of Oxford : Grants from the Department of Scientific and Industrial Research—£1,170 for the purchase of apparatus for the structural investigation and synthesis of peptides, to be carried out in the Dyson Perrins Laboratory ; £10,800 for the purchase of an electron-microscope for use in research in the Department of Metallurgy , £7,450 for work being carried out in the Clarendon Laboratory ; and £940 for work on the expansion of X-ray fluorescence analysis to lower atomic numbers, being carried out in the Research Laboratory for Archaeology and the History of Art, 126
  Grant of £1,600 from the National Coal Board, for the continuation of research on hot and humid conditions, being carried out in the Department of Human Anatomy, 126
  Grant of £10,450 from the National Institute for Research in Nuclear Science, for an investigation of the alignment of nuclei for the proton linear accelerator, to be carried out in the Clarendon Laboratory, 126
  Grant of £1,000 from the British Iron and Steel Research Association, for the continuation of research on the melting- and freezing-points of alloys, being carried out in the Department of Metallurgy, 126
  Grant of £3,330 from the Mental Health Research Fund, for research on the physiology of drive, to be carried out in the Institute of Experimental Psychology, 126
  Annual Report for 1959 of the Committee for Appointments, 682
  Appointment of Dr. E. P Abraham as reader in chemical pathology, 767
  Appointment of Dr. E Bulbring as reader in pharmacology, 767
  Appointment of Dr. W. A. Waters as reader in physical organic chemistry, 767
  Appointment of Dr. N Kurti as reader in physics, 767
University of Pennsylvania . Diagnostic Clinic of the Graduate School of Medicine, Medical Affairs, Vol 1, No. 3, Health of the Executive, 765
University of Pretoria · Appointment of Dr. J. M. Joubert to the chair of sheep husbandry and wool technology, 280
University of Reading : New Physics Laboratory of the (Prof R. W. Ditchburn), 768
University of Rochester, and others : Conference on Coherence Properties of Electromagnetic Radiation, 127
University of St Andrews . Appointment of Dr Ann R. Sanderson as senior lecturer in the Department of Zoology, Queen's College, 767
  Appointment of Dr D V Osborne as senior lecturer in the Department of Natural Philosophy, St. Salvator's College, 767
University of Sheffield Appointment of Boris Ford as director of the Institute of Education and professor of education in the Institute, 121
University of Southampton Contribution of £20,000 from Shell-Mex and B P. Ltd., to the 1962 Centenary Appeal Fund, 284
  Appointment of A. M MacIver to the newly established chair of philosophy, 284
  Title of senior lecturer in physics conferred on Dr. H G. Jerrard, 284
  Title of senior lecturer in physiology and biochemistry conferred on Dr. G. A. Kerkut, 284
  Title of senior lecturer in botany conferred on Dr. G. R Lane, 284
  Title of senior lecturer in electronics conferred on S. W. Punnett, 284
  Appointment of Dr R J Gribben and Dr. L. Marder as lecturers in mathematics, 284
  Appointment of H S Stachera as lecturer in electronics, 284
  Appointment of Dr I D. R Stevens as lecturer in chemistry, 284
  Appointment of T. C. Whitmore as lecturer in botany, 284
  Appointment of Prof G. W Hutchinson to a newly established second chair of physics, 762
University of Sydney · Astronomy in Australia—Stellar Interferometer of the School of Physics, 270
  From Nucleus to Universe—a Course of Selected Lectures in Physics and Astronomy, 1960 (edited by Prof S. T. Butler and Prof H Messel), *review* by G R Noakes, 748
University of Toronto · Grant of £70,000 from the Wellcome Trust, to build and equip basically additional research accommodation in the Charles H. Best Institute, 439
  A copy of *Illiac II* to be installed in the Computation Centre, 682
University of Wales : Retirement of Prof C. W Davies from the chair of chemistry in the University College of Wales, Aberystwyth, 680
  Appointment of Dr. A F Trotman-Dickenson to the chair of chemistry in the University College of Wales, Aberystwyth, 681
  New Biolgoy Building of the University College of Wales, Aberystwyth (Prof. T A Stephenson and Prof P F Wareing), 1021
University of Wisconsin Conference on the Chemical Organization of Cells, Normal and Abnormal, 604
University College, London · Grant of £30,000 from the Wellcome Trust, to build and furnish a research unit in cellular immunity as an annexe to the Department of Zoology, 439
  Title of reader in the history and philosophy of science in the University of London conferred on Dr N. H. de V. Heathcote, 522
  Retirement of Prof. E. S. Pearson from the chair of statistics, 599
  Appointment of Prof M. S Bartlett to the chair of statistics, 599
  Appointment of A. F Huxley to the University of London chair of physiology, 1020

University College of North Staffordshire : Appointment of Dr. Donald M. MacKay to the new Granada research chair of communication, 599
University College of Sierra Leone : Appointment of Dr Davidson Nicol as principal of Fourah Bay College, 599
University College of Wales, Aberystwyth . Retirement of Prof C. W. Davies from the chair of chemistry, 680
  Appointment of Dr. A. F Trotman-Dickenson to the chair of chemistry, 681
  New Biology Building of the (Prof. T. A. Stephenson and Prof P. F Wareing), 1021
University College of the West Indies, Jamaica : Grant of £8,000 from the Wellcome Trust, to purchase a mass spectrometer for use in the Medical Research Council's Tropical Metabolism Research Unit, 439
University Education, 1960-1970 ; Memorandum to the University Grants Committee on the Expansion of (National Union of Students), 687
University Entrance—the Basic Facts (National Union of Teachers), 14
University Grants Committee · Memorandum to the, on the Expansion of University Education, 1960-1970 (National Union of Students), 687
University Students : The Needs of, 687
University Work : Sixth-Form Science as a Preparation for (Dr. W. L. Sumner), 686
Unsteady Supersonic Flow : The Potential Theory of (Prof. John W. Miles), *review* by L. E. Fraenkel, 505
Unusual Web Pattern made by an Unfertilized Female of the Spider *Uloborus walckenaerius* Latreille (Dr. Rasza Szlep), 94
Upper Atmosphere : Density of the, and its Dependence on the Sun, as revealed by Satellite Orbits (D G. King-Hele and D. M. C. Walker), 928
Upper-Atmosphere Air Density at the Height of 180-212 km. derived from the Orbit of *Sputnik* III : Profile of (Z V Bochníček), 460
Upper Ionosphere : Electron Density Measurements in the, using the Faraday Rotation of Radio Signals from Artificial Satellites (Dr. D. McL. A. Wilson), 623
Upper Mantle : Structure of the, as derived from the Travel Times of Seismic *P* and *S* Waves (Dr. I Lehmann), 956
Uptake (Potassium-42), by the Rat Muscle *in vitro* : Effect of Denervation on (Dr. Z Drahota and O Hudlická), 396
Uptake Measurement : Thyroid Radioiodine (Dr Marshall Brucer), *review* by Dr. E. E. Pochin, 424
Uraninite and Thorianite (Dr. Bibhuti Mukherjee), 464
Uranus . Earthquakes and—Misuse of a Statistical Test of Significance (E. J. Burr), 336 ; (Prof. R Tomaschek), 337
Urbański, Prof. T., and others : Antimalarial Properties of some Guanidine Derivatives, 170
Urea . Radiation Synthesis of (S. Dilli and J H. Green), 383
Urea- or Phenol-treated T_2 Coli-Phage Preparations · Plaque-forming Ability of (Dr P H. Hofschneider), 330
Uretz, Prof. Robert B. (Freifelder, David, and) : Inactivation by Visible Light of Yeast sensitized by a Nucleic Acid Fluorochrome, 731
Urinary Excretion of a Ninhydrin-positive Compound, probably a Peptide, after Administration of β-Amino*iso*butyric Acid to the Mouse (Dr. James B. Gilbert and Dr. Yuoh Ku), 160
Urinary Phenols in Stress (R Robinson and Dr. P. Smith), 240
Urine : Desalting of, by Electrodialysis (Dr. T. Wood), 634
Urprinzip der Lebensvorgange : Die Ruckkoppelung als (Bayerische Akademie der Wissenschaften prize of 8,000 D marks for an Essay on), 938
Urquhart, Dr D. J : At the Scientific Publications Council's Discussion on the Rapid Increase in the number of New Scientific Journals, 18
U.S.A. : Water-Witching (Evon Z Vogt and Ray Hyman), *review* by Prof. H. J. Eysenck, 346
Use of an Auxiliary Grid to stabilize the Gain of a Photomultiplier (Dr. C. F. G Delaney and Dr A J. Walton), 625
Use of Film in Teaching and Research in British Universities, 1959 (British Universities Film Council), 444
Use of Ionizing Radiation in Spot Tests for Nitrogenous Compounds (H. J. M Bowen, E. Arter and P. A. Cawse), 383
Use of Laboratory Animals in the Standardization of Drugs (Research Defence Society, Pamphlet No. 10), 438
Use of Long-lived Natural Radioactivity as an Atmospheric Tracer (W M. Burton and N. G. Stewart), 584
Use of Miniature Gyroscopes in Aircraft and Guided Missiles (W. R. Simons), 522
Use of Nitrous Oxide to discriminate between the Forms of Hydrogen Atoms (H· and H_2^+ ?) produced by γ-Irradiation of Aqueous Solutions (Prof F. S Dainton and Dr D. B. Peterson), 878
Use of Nitrous Oxide to discriminate between Various Forms of Hydrogen Atoms existing in Aqueous Solutions of Potassium Iodide irradiated with Ultra-Violet Light (Prof F S Dainton and S A. Sills), 879
Use of Radioisotopes in the Physical Sciences and Industry (International Atomic Energy Agency Conference on), 284
Use of Solvents containing Ethyl Iodide in the Investigation of Phosphorescence Spectra of Organic Compounds (Dr I. J Graham-Bryce and J. M. Corkill), 965
Use (Meteorological), of Pulsed Doppler Radar (J R. Probert-Jones), 271
Use (Technological), of Radiation (Australian Atomic Energy Commission Conference on), 126
Uses (Peaceful), of Atomic Energy : Proceedings of the Second United Nations International Conference on the, held in Geneva, 1958, Vol 2, Survey of Raw Material Resources, *review* by Prof. C. F. Davidson, 921
Usinger, Prof Robert L., and Matsuda, Ryuichi · Classification of the Aradidae (*Hemiptera—Heteroptera*), *review* by R G Fennah, 46
U.S.S.R. : Cancer Research in the, *review* by Dr. P A. Gorer, 420
  Mineralogy in the (V F. Alyavdin), 853
  The Progress of Geology in the (Prof S I Tomkeieff), 438
  Reference Books on Mineralogy in the (Academy of Sciences of the U S S.R), 203
U.S S R and the International Geophysical Year, 359
Uterus of the Rat . Œstrogen–Insulin Interaction on the (Dr. R. Michel Zilberstein), 635
Utilization · Nuclear Theory and its, *review* by Dr. T E Allibone, 917
Utilization (Aspartic Acid), in *Leuconostoc mesenteroides* : (+) S-Methyl-L-Cysteine Sulphoxide, an Inhibitor of (Wilfred N Arnold, Clayton J Morris and John F. Thompson), 1051
Utne, F , and others . Vitamin A Isomers in the Liver of Rats and Chicks, 312
Uzman, L. Lahut, and others : Dipeptidase Activity of Brain, 559

VACCINATION with Fractions of Phenol-killed Tubercle Bacilli : Enhanced Resistance of Mice to Infection with *Pasteurella pestis* following (Prof. David W. Weiss), 1060
Vaccinia Virus : Eclipse Phase of (Dr. R. Postlethwaite and Prof. H. B. Maitland), 335
Vacek, Dr. A. : Significance of Adrenals for Increased Oxygen Consumption in Rats during Irradiation, 90
Vagal Stimulation or Acetylcholine Administration : Intracellular Potentials in Rat Atria during and after (P. A. Biersteker, J Th. F. Boeles and L N. Bouman), 637
Vaisey, Gillian : Appointed lecturer in civil engineering at the University of Birmingham, 767
Valantin, Dr J. G. : Quantum Effects on a Macroscopic Scale, *review*, 345
Vallance, L. G. Nitrogen in Tropical Agriculture (Nitrogen Fertilizing of Sugar), 942
Vallentine, H. R. : Applied Hydrodynamics, *review* by E. P. Sutton, 669
van Die, J. : Organic Acid Synthesis in Tomato Roots, 603
van Duijn, P., and Persijn, J.-P : A New Technique for Studying the Quantitative Aspects of Cytochemical Reactions and its Application to the Feulgen Reaction, 805
Van Gansen-Semal, Dr. P. : Occurrence of a Non-Fibrillar Elastin in the Earthworm, 654
van Gennep, Arnold : The Rites of Passage (translated by Monika B. Vizedom and Gabrielle L. Caffee), *review* by Dr. Kenneth Walker, 37
van Hecke, Francis : Polymer Formation in Irradiated *p*-Xylene, 382
van Niekerk, J. N., and de Wet, J. F : Trace Analysis by X-Ray Fluorescence using Ion Exchange Resins, 380
van Oosten, Dr. R P. : Industrial Chemistry of the Lower Olefines (The Production of Ethylene Oxide), 285
van Someren, Dr. Vernon D. : The Inland Fishery Research Station, Sagana, Kenya, 425
van Steenis, Prof. Dr. C G G. : Elected a Foreign Member of the Linnean Society of London, 766
van den Ende, J., and Koornneef, P : Gibberellic Acid and Osmotic Pressure, 327
van den Noort, Stanley, and others : Dipeptidase Activity of Brain, 559
Vanadium Catalysis of the Oxidation of Catechol Amines, Dihydroxyphenylalanine and 5-Hydroxyindoles (Dr. G M. Martin, E. P. Benditt and N. Eriksen), 884
Vandenkerckhove, Jean, and others Rocket Propulsion, *review* by J. E. P. Dunning, 186
Vandervelden, M., and others · Isolation of a Cytopathogenic Agent from Skin Lesions of Cattle, 979
Vapours : Flame and Explosion of Gases and, *review* by Dr. H F. Coward, 666
  Inhaled Particles and (British Occupational Hygiene Society International Symposium on), 524
Variance et Plans d'Expérience · Analyse de (Prof. Daniel Dugué et Prof. Maurice Girault), *review* by Dr D. J Finney, 68
Variants (Human Haemoglobin) : A New Electrophoretic Medium and its Application to the Resolution of (Dr. E. R. Huehns and Dr A O. Jakubovic), 729
Variation in *Phytophthora palmivora* (Butl.) Butl on *Theobroma cacao* L. in West Africa (P. D. Turner), 495
Variation (Diurnal Temperature), in the Rhesus Monkey under Normal and Experimental Conditions (Dr. Lloyd B. Erikson), 83
Variations in Electrophoretic Position of Haptoglobin Mixtures in Agar-gel Electrophoresis (Dr Jan Hirschfeld), 894
Variations (Individual), in Electrophoretic Position of an Indoxyl-acetate Splitting Component in the α_2-Globulin Region of Normal Human Sera · Agar-gel Electrophoretic Demonstration of (Dr. Jan Hirschfeld), 321
Various Levels of Bed Sediment : Haemoglobin Content of the Larvae of *Tendipes f. l. plumosus* L. from (B. Czeczuga), 484
Varma, Rama : Recent Advances in Coconut Research in India, 861
Vass, Dr C C. N. : At the Scientific Publications Council's Discussion on the Rapid Increase in the number of New Scientific Journals, 18
Vaughn, Joe W. (Watt, Prof. George W , and) · Mechanism of the Electroreduction of Complexes of the Type $[M(NH_3)_5X]^{n+}$, 309
Vejlby, Dr. Knud : Induction Phenomena in Photosynthesis of Isolated Spinach Chloroplasts, 652
Veis, Dr Arthur, and Cohen, Dr Jerome : Reversible Transformation of Gelatin to the Collagen Structure, 720
Velocity of Light in a Magnetic Field (Prof R. V Jones), 706
Venge, Dr Ole, and others · Inheritance of β-Globulins in Serum and Milk from Cattle, 907
Venkateswaran, Dr. S. : Appointed first controller-general of Patents, Designs and Trade Marks (India), 122 ; work of, 122
Venulet, J., and others : Antimalarial Properties of some Guanidine Derivatives, 170
Venus : Apparent Radio Radiation at 11-m Wave-Length from (Dr. J. D. Kraus), 462
Verghese, E. J Recent Advances in Coconut Research in India, 861
Verhoeven, W., and others (edited by) . Albert Jan Kluyver—His Life and Work, *review* by Prof. B. C. J G. Knight, 44
Vernon, Prof M. D. : Self-Regulation for Children, *review*, 38, 912
  The Brain in Response, *review*, 919
Vernon Prize for 1960 of the National Institute of Industrial Psychology awarded to Dr. R B. Buzzard, 938
Very Low Frequency Geomagnetic Fluctuations Influence of Geological Features on (H J. Duffus, J. A. Shand and Sir Charles Wright), 141
Very Low Temperatures · Reaction between Copper and Solid Oxygen condensed at, from a Gas Discharge (Jerome Kruger and William J. Ambs), 794
Veterinary Anatomy as a Branch of Biology · The Teaching of—its Relationships to Human Anatomy (Dr R A Green), 192
Veterinary Annual, 1959 (edited by W A. Pool), *review* by G N Gould, 667
Veterinary Association (British) · *Research in Veterinary Science*, Vol. 1, No. 1, 16
Veterinary Codex 1953 (British) 1959 Supplement to, *review* by Dr P. Jewell, 507
Veterinary Science, Research in, Vol. 1, No. 1 (British Veterinary Association), 16
Veterinary Surgery : Advances in, *review* by G. N. Gould, 667

Viability of Insect Migrants High in the Air : Mortality and (L. R. Taylor), 410
Viability and Tetrazolium Salt in Ascites Tumours (Dr. Gustav Dallner), 176
Vibrationally Hot Molecules in Free-Radical Reactions . A Model to account for the Production of (Dr. J. P Simons), 551
Vibrio foetus : Simplified Bulk Growth of (Dusan Jakovljevic and H. E. R. Beattie), 736
Vickery, B. C., and Foskett, D. J. : Classification and Indexing in Science, second edition, *review* by R Brightman, 190
Vijayalakshmi, K. . Recent Advances in Coconut Research in India, 860
Villiers, A. (textes de) : Les Plus Beaux Insectes, *review* by H Oldroyd, 187
Virulence (Staphylococcal) for Mice Enhancement of, by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin (Dr Daniel Amsterdam and Dr. S Stanley Schneierson), 101
Virus of Foot-and-Mouth Disease Influence of Route of Inoculation and Strain of Mouse on Infectivity Titrations of the (Wendy Heatley, H H Skinner and H. Subak-Sharpe), 909
Virus (Cauliflower Mosaic) Purification and Properties of (Prof. Thomas P. Pirone, Glenn S. Pound and Robert J. Shepherd), 656
Virus (Chicken Tumour) : Presence of, in the Sarcoma of the Adult Rat inoculated after Birth with Rous Sarcoma Tissue (Dr. Jan Svoboda), 980
Virus (*S E* Polyoma) : Development of Resistance in Mice to Tumour Induction by (Sarah E. Stewart, Bernice E. Eddy, Marjean Irwin and Stephanie Lee), 615
Virus (Rabies) An Indicator Plaque-forming System for Demonstration of Interference to Non-cytocidal Strains of (Dr Martin M. Kaplan, Dr Eberhard Wecker, Dr. Zlatko Forsek and Dr Hilary Koprowski), 821
Virus (Tobacco Mosaic) Decarboxylation of Glutamic Acid in Tobacco Leaves inoculated with (M S Gubanski), 657
  Primary Structure of the Protein of (F. A. Anderer, H. Uhlig, E. Weber and Prof. G. Schramm), 922
Virus (Turnip Yellow Mosaic) Protein Components from (Dr. J M. Kaper), 219
Virus (Vaccinia) . Eclipse Phase of (Dr. R. Postlethwaite and Prof H B, Maitland), 335
Virus *M* (Potato), and Paracrinkle (Dr. H. W. Howard and J. Wainwright), 993
Virus Particles (Encephalomyocarditis) : Crystallization of Purified Mouse (P. Faulkner, E M. Martin, S. Sved and Dr. T S Work), 908
Virus Release from Single Cells of Mouse Parotid Tumours (Dr Mathilde Krim and Dr. Leo Sachs), 262
Virus-infected (Ectromelia) Cells : Filamentous Structures in (Dr Benjamin V. Siegel), 820
Viruses of Trachoma, Inclusion Blennorrhoea and Lymphogranuloma : Transmission of the, to Mice (Dr E. Weston Hurst and P Reeve), 336
Viruses (Pox-) : Reactivation of, by a Non-Genetic Mechanism (Dr W. K. Joklik, Pamela Abel and I. H Holmes), 992
Visco-Elastic Systems (Australian Commonwealth Scientific and Industrial Research Organization Symposium on), 942
Viscous Phase of Liquid Sulphur : Structure of the (Dr. E. McLaughlin), 76
Visible Light : Inactivation by, of Yeast sensitized by a Nucleic Acid Fluorochrome (David Freifelder and Prof Robert B Uretz), 731
Visible and Ultra-Violet : Reflectance of Coal Vitrains in the, compared with that of Graphite (L A Gilbert), 143
Vision . The Eye and, *review* by R C. Davenport, 42
Visits (Selective), of Butterflies to Flowers—a Possible Factor in Sympatric Speciation (K R. Dronamraju), 178
Vistas in Astronautics (edited by Morton Alperin and Hollingsworth F. Gregory), Vol 2 (Second Annual Astronautics Symposium sponsored by the United States Air Force Office of Scientific Research and the Institute of Aeronautical Sciences), *review* by D G King-Hele, 59
Visual Pigment of the Horseshoe Crab, *Limulus polyphemus* (Dr Ruth Hubbard and Prof George Wald), 212
Visual Pigments : Regeneration of, from their Low-Temperature Photoproducts (Dr. C D. B. Bridges), 292
Visual System of *Octopus*—Regularities in the Retina and Optic Lobes of *Octopus* in relation to Form Discrimination (Prof J. Z Young), 836 ; Discrimination of Polarized Light by *Octopus* (M. F Moody and J R Parriss), 839 ; Theories of Shape Discrimination in *Octopus* (Dr N. S Sutherland), 840
Vitamin A : Effect of, on the Cystine Content in Skin of Rats (Prof Tatsuo Koyanagi and Satoru Odagiri), 809
Vitamin A_1 Aldehyde in Hen's Eggs (Dr. P. A Plack), 234
Vitamin A Isomers in the Liver of Rats and Chicks (O. R. Braekkan, H. Myklestad, L R. Njaa and F Utne), 312
E-Deficient Liver Homogenates . Maintenance of α-Ketoglutarate and Succinate Oxidation in, by α-Tocopherol, a Tocopherol Metabolite, Menadione and Diphenylphenylenediamine (Dr Laurence M. Corwin and Dr. Klaus Schwartz), 1048
Vítek, Dr. V., and Ryšánek, K Inhibition of Monoamine Oxidase by Benactyzine *in vitro* and *in vivo*, 244
Vitrains (Coal), in the Visible and Ultra-Violet Reflectance of, compared with that of Graphite (L A Gilbert), 143
Vittek, J (Hoja, S., and) Treatment of Injured and Regenerating Muscles with Plant Extracts, 283
Vivisection (Research Defence Society Pamphlet on), 125
Vogt, Evon Z., and Hyman, Ray : Water-Witching U S.A , *review* by Prof H J Eysenck, 346
Vokes, J C., and others . Coherence and Band-width of a Gas Discharge Harmonic Generator, 626
Volatile Mercaptan Mixtures . A Rapid Method for Qualitative Analysis of (John F Carson, William J Weston and Jack W Ralls), 801
Volume Changes (Small Rapid), in a Muscle during Activity : Determination of (Prof B C Abbott and R J Baskin), 1055
Volume Control in an Ascites Tumour Cell : Effect of Antibody and Complement on (Dr H Green and Dr F. Silverblatt), 646
Volvox Colonies and Snail 'Cystase' (Dr B C Sharman), 90
von Bahr, G , and others (edited by) Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
von Bunau, H Fischer, and others (edited by) : Documenta Ophthalmologica (Advances in Ophthalmology, Vol. 13), *review* by R. C. Davenport, 42
von Hayek, Prof Heinrich : Elected a member of the Medicine Section of the Leopoldina Academy of Natural Sciences, 766
von Humboldt, Alexander (1769-1859) : Preparation of an edition of the letters of (German Academy of Science and the Austrian Academy of Science), 685
von Kármán, Th , and others (edited by) : Advances in Aeronautical Sciences—Proceedings of the First International Congress on the Aeronautical Sciences, (Madrid 1958), *review* by Prof. A. R. Collar, 665
von Wettstein, Dr. Diter H. : Appointed associate professor in the Department of Botany in Yale University, 1020
Vonk, Dr. C. G. Effect of a Second Crystalline Modification in Polyethylene on X-Ray Crystallinity Measurements, 962
Vygodchikov, G. V. (edited by) : Pathogenesis and Immunology of Tumours, translated from the Russian by R Crawford, *review* by Dr. P. A. Gorer, 420

WACHSMUTH, Prof. Werner : Elected a member of the Medicine Section of the Leopoldina Academy of Natural Sciences, 766
Waddington, Dr. T. C. Awarded a Meldola Medal for 1959 of the Society of Maccabaeans, 519
Wain, Prof R. L. : Elected a Fellow of the Royal Society, 12
  Awarded the Research Medal of the Royal Agricultural Society of England, 685
Wainwright, J. (Howard, Dr. H. W , and) : Potato Virus *M* and Paracrinkle, 993
Wait, James R. : Electromagnetic Radiation from Cylindrical Structures, *review* by W. Brown, 583
Wake, Dr W. C. : Bonds between Rubber and Metal, *review*, 189
Waksman, Prof. Selman A. : The Actinomycins and their Importance in the Treatment of Tumours in Animals and Man, 771
Wald, Prof George (Hubbard, Dr. Ruth, and) Visual Pigment of the Horseshoe Crab, *Limulus polyphemus*, 212
Wales, National Museum of Annual Report (1958-59), 15
Walker, Dr. D. G : Appointed lecturer in biochemistry at the University of Birmingham, 937
Walker, D. M C. (King-Hele, D G., and) : Density of the Upper Atmosphere and its Dependence on the Sun, as revealed by Satellite Orbits, 928
Walker, Dr. J. : Title of reader in reactor physics in the University of Birmingham conferred on, 767
Walker, Dr Kenneth : Human Rites, *review*, 37
  Problems of Human Fertility, *review*, 188
Walker, jun , Dr P L. (Redmond, Dr. J P , and) : Gas Content of Graphites, 72
Wall, C T. C. : Elected to a Harkness Fellowship for 1960 of the Commonwealth Fund, 15
Wall, Dr. W. D. : Psychology of Gifted Children, 692
Wall of the Gastro-intestinal Tract of the Infant Mouse : Passage of Insulin through the (W A. Kelly), 971
Wallace, Prof Bruce, and Dobzhansky, Prof. Th. : Radiation, Genes and Man, *review* by Dr. A. G. Searle, 109
Waller, J G. . New Clathrate Compounds of the Inert Gases, 429
Wallis, Dr. F. S. : The Philosophy of Museums, *review*, 110
Walsh, D , and others : Coherence and Band-width of a Gas Discharge Harmonic Generator, 626
Walter, Dr J. B., and Slome, Prof. D. : Effect of *S*-β-aminoethyl*iso*thiouronium Bromide Hydrobromide on X-Ray Damage to Guinea Pig Skin, 177
Walton, Dr A. J. (Delaney, Dr. C. F G , and) Use of an Auxiliary Grid to stabilize the Gain of a Photomultiplier, 625
Walton, Dr. E. K. Orogens (The Eugenosynclinal Region of the Scottish Southern Uplands), 690
Walton, Prof J. : Miocene Floras of the Columbia Plateau, *review*, 66
  The Morphology and Anatomy of American Species of the Genus *Psaronius*, *review*, 190
Wandering British Scientist : The, 436
Wang, Dr. Dalton An Ion-Exchange Resin Method for the Fractionation of Alcoholic Plant Extracts, 326
Ward, Dr F. A. B. : Horology in Medieval China, *review*, 834
Ward, J. C , and others : The Tesla-coil Method for Producing Free Radicals from Solids, 712
  Polymerization of Crystalline Methacrylic Acid initiated by Ultra-violet Radiation, 713
Wardlaw, Prof. C. W : The Banana, *review*, 48
Ware, C. C , and Nicol, Prof. T. : Duration of Stimulation of Phagocytic Activity of the Reticulo-Endothelial System after Cessation of Treatment with Diethylstilboestrol, 974
Wareing, Prof. P F. (Stephenson, Prof T A , and) New Biology Building of the University College of Wales, Aberystwyth, 1021
Waring, S A. : Nitrogen in Tropical Agriculture (Nitrogen Fertilizing of Grain and Forage Crops), 942
Warkany, Dr. Josef : Elected president of the Teratology Society, 937
Warkentin, Prof B. P (Blackmore, Dr. A V., and) : Swelling of Calcium Montmorillonite, 823
Warm-blooded Animal (a Cold- and a) : Influence of Temperature upon Blood Coagulation in (Dr. H. B. Anstall and Dr. R. G. Huntsman), 726
Warren, Francis A . Rocket Propellants, *review* by Dr. W. B Littler, 58
Warren, Dr. Leonard : Thiobarbituric Acid Spray Reagent for Deoxy Sugars and Sialic Acids, 237
Washing the Benzidine Sulphate Precipitate in the Determination of Sulphate A Modification for (Dr I. P T Hakkinen), 232
Water . Primary Processes in the Action of Ionizing Radiations on—Formation and Reactivity of Self-trapped Electrons ('Polarons'), (Prof. Joseph Weiss), 751
Water in the Rat Effect of Severing the Olfactory Bulbs on the Intake and Excretion of (V. Nováková and H. Dlouhá), 638
Water (Drinking) Fluoridation of (Gerald H. Leatherman and J. A. Ellis), 438
Water (Ground) Hydrology (Prof. David Keith Todd), *review* by E. Miller, 423
Water (Rain-) Sodium/Potassium Ratio in (Dr. A. T Wilson), 705
Water (Sea-) as the Primary Source of Sulphate in Tidal Swamp Soils from Sierra Leone (J C. D. Watts), 308
Water (Tritiated) : Saliva-Serum Ratios of Tritium after the Administration of (Dr A. J. Coppen and Dr. J. L. Gibbons), 724

Water (Tritiated) Samples . Preparation of, by Distillation (J. D. Simpson and Dr. J. R. Greening), 467
Water Bloom (A Red), of Rotifers in Cook Strait, New Zealand (Vivienne Cassie), 328
Water-boatman (*Krizousacorixa femorata*) : Inheritance of Asymmetry in a (Dr. Walter Peters), 737
Water Committee, Central Advisory : Final Report of the Trade Effluents Sub-Committee (Ministry of Housing and Local Government), 210
Water Pollution by Trade Effluents, 210
Water Proton Line : Broadening of the, in High-Resolution Nuclear Magnetic Resonance Spectra of Starch Gels (Dr. Roger Collison and Dr. M. P. McDonald), 548
Water Research Association : Fourth Annual Report (1958-59), 683
Water Resources, *review* by E. Miller, 423
Water-Soluble Methacrylates as Embedding Media for Preparation of Ultra-Thin Sections (Dr O. Wichterle, Dr. P. Bartl, and Dr. M. Rosenberg), 494
Water Solutions · Ultra-Violet Spectra of (R. M Golding), 308
Water-Witching U.S A. (Evon Z. Vogt and Ray Hyman), *review* by Prof. H. J. Eysenck, 346
Waterhouse, Dr. Douglas F. : Appointed chief of the Division of Entomology of the Commonwealth of Australia Scientific and Industrial Research Organization, 763 ; work of, 763
Waterlow, Dr. J. C. : Medical Research in the British Caribbean, 862
Waterman, Dr. Alan T. : Awarded the Public Welfare Medal of the United States National Academy of Sciences, 686
Waters, A. C., and others : Principles of Geology, second edition, *review* by Dr. J V. Harrison, 57, 440
Waters, Lieut.-Comdr. D. W. : Appointed curator of navigation and astronomy in the National Maritime Museum, Greenwich, 12 , work of, 12
Waters, Dr. W. A. Appointed reader in physical organic chemistry at the University of Oxford, 767
Waters (Mine-) Iron Bacteria in (Dr. L. G. M. Baas Becking and Dr. D. Moore), 670
Watheroo Magnetic Observatory, Melbourne, 606
Watson (James Craig) Medal of the United States National Academy of Sciences awarded to Prof. Yusuke Hagihara, 686
Watson, Prof. Kenneth M., and others : Chemical Process Principles, Part 2, Thermodynamics, second edition, *review* by L. E. Marc de Chazal, 1003
Watson, Dr. Marion . Nature and Exploitation of Crop Plant Resistance to Disease (Interaction, or Genetic Recombination, between Potato Viruses Y and C), 858
Watt, Prof George W., and Vaughn, Joe W : Mechanism of the Electro-reduction of Complexes of the Type $[M(NH_3)_5X]^{n+}$, 309
Watt, P. A. (Newstead, Prof. Gordon, and) : A Telemetered Seismic Net in Tasmania, 704
Wattley, Dr. G. : Medical Research in the British Caribbean, 862
Watts, D. C. : Elected to a Beit Memorial Junior Fellowship for Medical Research, 520
Watts, J. C. D. : Sea-Water as the Primary Source of Sulphate in Tidal Swamp Soils from Sierra Leone, 308
Wave Functions (Gaussian), for the Hydrogen Molecule (J. V L. Longstaff and Dr. K. Singer), 799
Waverley Gold Medal Essay Competition (*Research*), 937
Waves (Gravitational), in General Relativity (Dr. H. Bondi), 535
Waves (Millimetre) from Mercury Arc Harmonic Generator (Dr. K. D. Froome), 959
Waves (Seismic P and S) : Structure of the Upper Mantle as derived from the Travel Times of (Dr. I. Lehmann), 956
Waves (Ultrasonic) . Cleaning of Fossils by (J. N. M. Firth), 684
Wawrzyczek, Dr. Wiktor : Application of Pyramidone to Detection of Nitrous Acid, 883
Wawrzyniak, J., and Sujak, Dr. B. : Photo-stimulated Emission of Exo-electrons from the Surface Layer of Amphoteric Metals reacting with Concentrated Sodium Hydroxide or Potassium Hydroxide, 467
Ways and By-Ways : Geological, *review* by Dr J. V. Harrison, 57, 440
Wealth of India, a Dictionary of Indian Raw Materials and Industrial Products—Raw Materials, Vol. 5, H–K, *review* by Dr. F N Howes, 70
Weaver, Dr. Warren : A Quarter Century in the Natural Sciences, 20
Web (Terminal) : Structures corresponding to Terminal Bars and, in Many Types of Cells (Prof. C. P. Leblond, Holde Puchtler and Y. Clermont), 784
Web Pattern (Unusual), made by an Unfertilized Female of the Spider *Uloborus walckenaerius* Latreille (Dr Rasza Szlep), 94
Weber, E., and others : Primary Structure of the Protein of Tobacco Mosaic Virus, 922
Webster, Dr. F V. : Given the Wolfe Award for 1959, 17
Wecker, Dr. Eberhard, and others . An Indicator Plaque-forming System for Demonstration of Interference by Non-cytocidal Strains of Rabies Virus, 821
Weed Research Organization of the Agricultural Research Council, 436
  Appointment of Dr E. K. Woodford as director, 436
Weedon, Dr. B. C. L. Appointed to the University of London chair of organic chemistry in Queen Mary College, 522, 762 ; work of, 762
Weevil : The Large Pine (*Hylobius abietis*), (Forestry Commission, Leaflet No. 1), revised edition, 521
Weigel, Dr. H , and others : Action of a Bacterial Dextranase on Branched Dextrans, 553
Weight Standards for Men and Women : New (Metropolitan Life Insurance Co., Ltd , New York, Bulletin, Vol. 40), 445
Weight and Tail Length . The Growth in, of Inbred and Hybrid Mice reared at Two Different Temperatures (Prof. G. A. Harrison, R. J. Morton and Dr. J S Weiner), 446
'Weightless' Micro-electrodes for Recording Extracellular Unit Action Potentials from the Central Nervous System (Prof. B. Delisle Burns and Dr. J. G. Robson), 246
Weinberg, Dr. Alvin M. (Zinn, Dr. Walter H., and) : Awarded jointly the Atoms for Peace Award for 1960, 357
Weiner, Dr. J. S , and others : The Growth in Weight and Tail Length of Inbred and Hybrid Mice reared at Two Different Temperatures, 446
Weininger, Dr J. L. Reaction of Active Nitrogen with Polyethylene, 546
Weinman, Dr. David Trehalose Metabolism of Trypanosomes, 166
Weiss, Prof David W : Enhanced Resistance of Mice to Infection with *Pasteurella pestis* following Vaccination with Fractions of Phenol-killed Tubercle Bacilli, 1060
Weiss, Prof. Joseph : Primary Processes in the Action of Ionizing Radiations on Water—Formation and Reactivity of Self-trapped Electrons ('Polarons'), 751
Weizmann Institute of Science : The Hand of Life—the Story of the (Ritchie Calder), *review*, 64
  International Conference on Science in the Advancement of New States, 604
  Appointment of Prof. I Berenblum to the chair of experimental biology, 681
Welch, J. H. : A New Interpretation of the Mullite Problem, 545
Wellcome Trust : Carlsberg–Wellcome Travelling Research Fellowships, 283
  Grant of £120,000 to King's College, London, towards the purchase of the lease of premises to house a Department of Biophysics, 439
  Grant of £70,000 to the University of Toronto, to build and equip basically additional research accommodation in the Charles H. Best Institute, 439
  Grant of £15,000 to the Johns Hopkins Hospital, Baltimore, to adapt premises in the Department of Medicine as a research laboratory for studies of the heart and blood vessels in man, especially by the method of X-ray cinematography, 439
  Grant of £30,000 to University College, London, to build and furnish a research unit in cellular immunity, as an annexe to the Department of Zoology, 439
  Grant of £8,000 to the University College of the West Indies, Jamaica, to purchase a mass spectrometer for use in the Medical Research Council's Tropical Metabolism Research Unit, 439
  Grant of £2,500 per annum for up to five years, to St. Mary's Hospital Medical School, London, to provide technical assistance and research expenses for work on the physiology of pre-natal growth, 439
  Grant of £50,000 to the Massachusetts General Hospital, Boston, for the establishment of a Henry S. Wellcome research chair in medical science, 937
Welsh, Prof. J. H. · 5-Hydroxytryptamine in Coelenterates, 811
Welsh Coast : *Caretta kempi* Garman on (Colin Matheson), 989
Welsh Slates : Anisotropy of Susceptibility and the Natural Remanent Magnetization of some (M. D. Fuller), 791
Welsh Soils Discussion Group : Field Meeting, 127
Wenzel, Frank : The Buzzard (translated from the Danish by Reginald Spink), *review* by Frances Pitt, 65

DEVELOPMENT OF NUCLEAR ENERGY IN BRITAIN

THE examination of the work of the Production Group and the Development and Engineering Group, into which the Industrial Group of the Atomic Energy Authority was divided in July 1959 by the Select Committee on Estimates, was described in the Committee's Fifth Report for the Session 1958–59*. The report is noteworthy as the first detailed examination of the work of the Authority by a Parliamentary Committee. The Industrial Group comes well out of this scrutiny; the Select Committee makes numerous favourable comments, and it has since been announced that the Authority has accepted substantially all the Committee's recommendations. The organization of the Authority was, of course, scrutinized two years previously by the Fleck Committee, which was particularly concerned with the organization of the Industrial Group, and the rearrangement made last July was contrary to the recommendation of that Committee, though intended to reduce the span and hence the burden of management, which the Fleck Committee had itself regarded as a weakness in the Group. In welcoming this decision, the Select Committee expresses the opinion that the advantages are now such as to offset the disadvantages which led the Fleck Committee to oppose such a change at the time.

While the report is of particular interest for the light it throws upon the position of the Industrial Group in Britain's research effort, and the magnitude of the demand made for man-power and other resources, the two main questions with which the Select Committee was concerned are the general strategy of the development of nuclear power in the United Kingdom and the relation between the Authority and the industrial companies operating in this field. The staff position, and to some extent the research effort, is directly related to the organization of the Industrial Group, nor can either be separated sharply from the general policy adopted in the development of nuclear power or the way in which this development is shared between the Authority and the industrial consortia. Both are competing, for example, for highly skilled man-power which is relatively scarce, and it is now only too clear that the market for nuclear energy is relatively limited.

One feature in the situation is the rapidity with which the Industrial Group has expanded. From a staff of 16 when the original nucleus was formed in the Production Division of the Ministry of Supply in 1946, the Industrial Group had grown to a staff of 10,000 in 1955, and by March 1959 to more than 18,000; and its annual gross expenditure is estimated to have increased by 50 per cent between 1956–57 and 1959–60; about half the present staff of 18,000 are employed in the factories. The total is expected to exceed 23,000 by 1961–62. Works staff has increased by 16 per cent between 1958 and 1959 and is expected to increase by a further 12 per cent between 1959 and 1960. The Research and Development Branch increased by 9 per cent between 1957 and 1958, and a further 22 per cent increase on the 1958 figure is expected by 1960, including an increase of 600, of whom 80 are senior staff arising from acceptance of the recommendations of the Fleck Reports.

Nevertheless, the real check on the magnitude of the development effort of the Group has been the shortage of scientists and engineers, and serious difficulty has been encountered in filling the most senior posts. As already noted, the decision to split the Industrial Group was made to reduce the burden of management at the managing director and deputy managing director level, and to the same end the Authority has decided to restrict its research, development and design organizations to an annual growth of about 8 per cent for the next three years. This decision must strictly limit the number of reactor systems which the Group can develop; but since limitation is imposed in terms of staff, not expenditure, expansion in excess of this figure could be achieved by placing more contracts with industry and the universities.

The industrial consortia are understood to be employing already some 4,000 men on reactor design and development; but on this question of the balance of the whole research and development effort of Britain, the Select Committee, which welcomes the Authority's decision to limit its annual expansion of staff, makes no comment. It recognizes, indeed, that total development effort cannot be properly controlled on the basis of *ad hoc* decisions on individual development projects, and it found no evidence of over-staffing at any of the works or establishments it visited, though it expresses concern as to the size of the Risley headquarters, where about 20 per cent of the Group's staff is employed. About half of these are employed in the Engineering Branch, and several hundred in the Finance and Personnel and Administration Branches. The Select Committee does not regard the Engineering Branch as excessive in size at present, but suggests that it should remain fairly static in size; and it is clear from the report that the Authority is fully conscious of the danger and, apart from the beneficial effect in this respect of the creation of the two new Groups, is also taking measures to see that opportunities of down-grading jobs are not missed.

Some of the Select Committee's specific recommendations bear closely on this question of efficiency. Thus it suggests that the increased status and responsibilities of works general managers should be recognized in a way that will ensure that these posts attract men of the high calibre required. Further, the Authority should consider whether more formal arrangements are required to co-ordinate the work of the Production and Development and Engineering Groups when the present arrangements have been tried over a reasonable period. It is also recommended that after a reasonable period of experience of the new organization, the system of co-ordinating the work being done at the various laboratories should be reviewed, to avoid duplication or lack of balance. Generally, the Committee was satisfied with the way the Industrial Group has tackled a succession of novel problems, and the recognition of the importance of cost is shown in developing a modern system for controlling expenditure. Military requirements, however, are now ceasing to be the predominant influence in the work of the Group, and with the growing emphasis on reactor development and commercial activities, it is the more important to bring industry into partnership with the Group so as to obtain the greatest economic value from scientific and capital resources in this field.

---

* Fifth Report from the Select Committee on Estimates, Session 1958–59: United Kingdom Atomic Energy Authority (Production Group and Development and Engineering Group). Pp. lxxxv. (London: H.M. Stationery Office, 1959.) 5s. net.

Here in the section on partnership with industry the Select Committee makes some important comments. Admittedly, only a Government-financed organization can, at this stage, afford the necessary capital, the extended research and development work, or the long-term risks that are required for the development of nuclear power for civil purposes. The primary responsibility for the development of nuclear power for these purposes in Britain must lie with the Authority, if the limited resources of the nation are not to be dissipated. Nevertheless, the relative positions of the Authority and of industry have been changing rapidly, and the Select Committee believes that the Industrial Group should respond to the changed situation by bringing industry into closer partnership at every stage of development.

This should include a deliberate policy of enabling industry to play a greater part in certain activities for which the Group has been largely responsible in the past, partly to ease the strain on the Group's own resources, partly to ensure that resources available to industry are economically employed, and partly also to enable industry more quickly to acquire the ability to originate and exploit nuclear developments itself. Specifically, the Committee recommends that the Industrial Group should invite the industrial consortia to attach a limited number of people to experimental reactor projects and take positive steps so as to make sure that they are quickly aware of the progress of work on such projects. If no experimental reactor is to precede the prototype stage of a system, the consortia might be invited to join the Group in technical discussions as soon as feasibility studies are complete. More contracts with industry are also suggested for the design and construction of complete chemical and fuel fabrication plant, and it is expected that four-fifths of the additional design capacity required by 1960 will be provided under design contracts with industry. When further expansion of plant for the fabrication of fuel elements is required, the Select Committee recommends that the Authority, the Electricity Generating Boards and the consortia should jointly consider the possible advantages of these facilities being provided and operated by others than the Authority.

The industrial consortia are already making a considerable contribution in research and development on the Magnox system, which they are exploiting commercially, but during 1958–59 only about 8 per cent of the Group's operating expenditure on research and development was accounted for by extra-mural contracts with industry and universities. Most of this extra-mural work was done with industry, and the Committee particularly welcomes the evidence that the Authority now intends to increase considerably the volume of research and development work being placed with industry. This will mainly be work not requiring irradiation or radioactive examination facilities in mechanical or electrical engineering, gas dynamics, heat transfer and metallurgy of reactor systems. It is planned to treble the value of extra-mural work in the next few years, and, it is hoped, increase tenfold between 1958–59 and 1959–60 the extra-mural research expenditure by the Dounreay establishment.

The pattern of research and development at Dounreay is somewhat different from that at other establishments, and the work of the laboratories there is not so easily separated from that of the rest of the establishment. Most of it is in support of the fast reactor, but work is included on enriched fuel elements for the Dounreay materials-testing reactor, examinations of these elements after irradiation and plutonium technology. The most noticeable feature about the research effort of the Industrial Group as a whole, however, is the rapidity of its growth. In terms of operating expenditure, the research and development effort increased by about 280 per cent between 1956–57 and 1959–60 and by about 110 per cent even if Dounreay expenditure is excluded, while the gross expenditure of the Group is estimated to have increased by about 50 per cent between 1956–57 and 1959–60.

The Select Committee expresses no opinion as to whether the total research effort of the Industrial Group is too large or too small, but, while it is impressed by the way the Authority has so far kept the reactor development programme co-ordinated and concentrated, it does not appear to be entirely satisfied that this will remain so. In terms of manpower, it is estimated that about a quarter of the Group's total research effort will still be employed in relation to Calder Hall and Central Electricity Generating Board reactors, about a fifth on the advanced gas-cooled reactor, and about a tenth on the problems of the fast reactor. This is much the same as in 1958–59, and the Select Committee does not think it desirable that the Industrial Group should be required to devote continuing and large-scale effort to achieving marginal improvements in the operating performance of systems it has developed in the past. The Group's principal task is to create and develop new systems, and it is recommended specifically that research and development work of this character on reactors at present under construction for the Central Electricity Board should, so far as possible, be confined to problems with which the Electricity Board and the industrial consortia are not equipped to deal.

The strong support which the Select Committee lends to the development of the fast reactor programme is noteworthy, and particularly in view of the importance which it attaches to a proper balance of effort. It recommends that this priority should now receive special consideration, and it particularly welcomes the assurances that essential work on this system had not suffered from lack of plutonium, that the fast reactor was not being held back by work being done on any other reactor system and that the whole plutonium technology research programm is to be extended. The Select Committee's assessment of the situation has indeed gained in value since the report was issued in view of the tendency in some current discussions to discount the nuclear power programme on account of the over-stocking of coal. On balance, the Committee regards the Authority as right in limiting its effort as it has done, even to the extent of devoting no design or development effort in the Industrial Group specifically to reactor systems for export.

Nevertheless, the Select Committee considers that the Authority as well as industry should be ready to make some contribution in this field, and the limitations imposed by man-power considerations alone on a research and development effort of the magnitude of the Atomic Energy Authority is sufficient reason why the research and development effort of the whole of Britain needs to be brought very carefully under review before entering on large commitments in new fields such as space research. That has been very eloquently pressed by Mr. Woodrow Wyatt, and also by Mr. F. V. Corfield, Mr. G. de Freitas and Mr. G. Chetwynd in an adjournment debate in the House of Commons on February 22. Fortunately, Mr. G. Rippon, Parliamentary Secretary to the Ministry of Aviation, who replied on the debate, while sympathizing with the cogent arguments advanced, did not depart from the warning of the Advisory Council on Scientific Policy that there is a financial limit to what Britain can do. Mr. Rippon pointed out that while the Advisory Council has not recommended any British participation in the attempt to launch human beings into space, it is convinced that British science and technology have contributed, and would continue to contribute, valuable results in space research. The review by the Select Committee on Estimates of the work of the Industrial Group of the Atomic Energy Authority shows once again the severe limits on the resources of Britain, the vital necessity of keeping the research and development effort in reasonable balance, and the desirability that contributions in new fields such as space research should be made in specific directions appropriate to the special skills available in Britain and that where possible they should be part of an internationally based approach.

SUPERFICIAL CHEMISTRY AND SOLID IMPERFECTIONS*

By Prof F. C. TOMPKINS, F.R.S.

MATTER at the boundaries or interfaces between two different phases, for example a solid and a gas, has unusual properties. Of the many problems involving gases in contact with a solid surface, perhaps the most compelling and least understood is that of heterogeneous catalysis, which in the present context is confined to the acceleration of the rate of reaction of gases brought about by the introduction of a solid surface. There is a marked contrast between the extremely successful efforts of the industrial technologist in producing specific and efficient catalysts and the modest progress made in the elucidation of the basic principles of catalytic action. However, particularly in the past fifteen years, considerable advance has been made in our understanding of the bonding of gas molecules to surfaces of solids (here restricted to metal surfaces) largely arising from the use of new techniques.

The surface of a metal may be compared to a large free radical with 'dangling valences' which readily form chemical bonds of strength and character similar to those in primary chemical bonds. Not until the brilliant experimental work of J. K. Roberts in Cambridge, some thirty years ago, was it recognized that this process of chemisorption of a gas, in particular of oxygen, was practically instantaneous even at − 196° C. Calculation shows that oxygen at a pressure of 10^{-10} atm. forms a complete chemisorbed monolayer within 1–2 min. so that, at least in respect of chemisorption, most of the earlier experimental work has to be rejected. The problem to-day is, in principle, solved by the use of modern vacuum pumps, which attain pressures lower than 10^{-13} atm., so that time can be made available for accurate measurements. However, since the metal surface is bound to have been in contact with air at some time, there is the difficulty of the initial removal of the chemisorbed layer since, for example, oxygen is so strongly bound to a tungsten surface that heating to 1,500° C. in the highest vacuum over a period of a year will not remove it, nor is hydrogen reduction at this temperature any more effective. Only by flashing at 2,500° K. can a clean surface be obtained, and, even so, this is brought about by breaking the W–W bond and not the W–O link. However, Beeck's method of evaporating a metal in high vacuum and condensing the vapour on the walls of the reaction vessel has virtually removed the major difficulties of obtaining clean metal surfaces.

---

* Substance of an inaugural lecture delivered at the Imperial College of Science and Technology, London, on February 2.

A chemisorbed layer has a tremendous effect on the electron emission from tungsten at 1,500° C., because of the increase or decrease of the energy required to free an electron from the metal; from this change of work function the dipole moment of the chemisorbed bond may be calculated using an elementary theorem in electrostatics. The sign of the dipole gives information as to whether the metal acts as an electron donor or acceptor, and the magnitude is a measure of the extent of charge transfer; this knowledge has value, since the catalytic effect of metals may well be dependent on their acting as sinks or sources of electrons. The results of these investigations can be combined with those of others; from the heat of chemisorption, the strength of the chemisorbed bond may be estimated; from the change of electrical resistance brought about by chemisorption of gases on metallic films, the extent of localization of electrons in the bond may be deduced; and from the change of magnetic susceptibility, the difference in the number of paired electron spins (a property of covalent bonds) can be obtained. Considerable information is therefore available, and correlation with the known efficiency of metal catalysts may be sought.

For example, copper, silver, gold are ineffective catalysts for hydrogenations or in carbon monoxide and hydrogen syntheses, whereas nickel, iron, cobalt are highly efficient. From the fundamental investigations, the bonding of these gases to copper, silver and gold is non-directional and largely electrostatic in nature; with nickel, iron, cobalt it is specific and directional. Hence it is probable that an efficient catalyst must impose an orientational effect and so induce the formation of a particular configuration of an unstable, short-lived, intermediate product which forms the initial point of a sequence of events leading to the final products of the process—and the possession of directional properties can be associated with specific features of the atomic structure of the transition elements which are absent in Group *IB* metals.

Advantage may also be taken of the fact that the sign and magnitude of the dipole moment of the chemisorbed bond are specific. Thus, the CO-bond to nickel has a dipole moment five times that of hydrogen, both being negative outwards from the metal, and four times that of the CO-bond to copper, where, however, it is positive. An example is the reaction of carbon monoxide and hydrogen at an iron surface. The bonding of carbon monoxide to the surface is similar to that between the carbonyl group and the iron atom in the free molecule, iron carbonyl (Fig. 1); hydrogen, however, is adsorbed as atoms which are located between the surface iron atoms, that is, interstitially (Fig. 1). When there are equal numbers of carbon monoxide molecules and hydrogen atoms in the saturated layer, possible structures are shown in Fig. 2, with the corresponding measured or estimated work-function changes. Structure (*b*), and particularly (*c*), the aldehyde structure, have frequently been postulated in many mechanisms for this particular reaction, but none is consistent with the measured work-function value (Fig. 3). However, a surface structure analogous to the iron hydrocarbonyl molecule (Fig. 4), often suggested as an intermediate product in liquid-phase syntheses of similar nature, in fact gives the experimental value. Here the hydrogen atom (probably ~ 1 Å. from the surface) 'donates' about half the electronic charge to the metal.

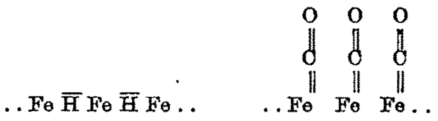

Fig. 1

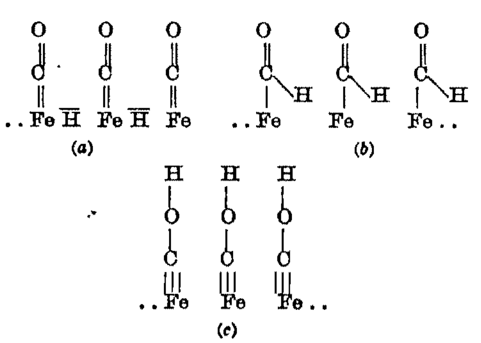

Fig. 2

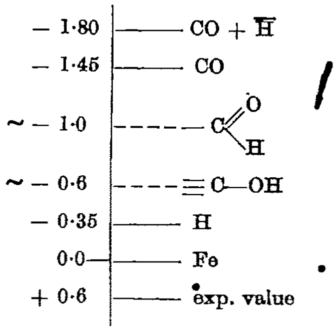

Fig. 3

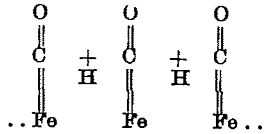

Fig. 4

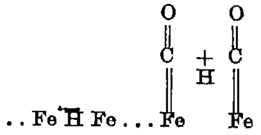

Fig. 5

The interesting new feature is the dual role of the hydrogen atom (Fig. 5)—it is bonded interstitially between two metal atoms, only when these are free of other attachments. It then carries an overall negative charge, is difficult to detach from the surface, but is reasonably free to move over the surface. When, however, the two metals have engaged in chemisorption of carbon monoxide, despite the fact that the hydrogen atom can easily get into the interstitial position, it prefers to remain 'outside' the surface, between the carbon monoxide groups, where it carries a positive charge. From this position it is easily detached, is highly reactive, and can move over the surface with comparative ease. The metal therefore appears to act simultaneously as an electron donor and electron acceptor, and the catalytic process may thus have some analogy to the Brønsted–Lewis

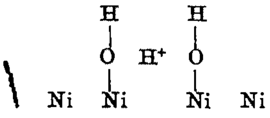

Fig. 6

acid-base catalysis familiar to students of solution kinetics. Similarly, when a nickel surface is contaminated with chemisorbed oxygen, subsequent hydrogen adsorption gives a structure shown in Fig. 6, and this may be one reason why the industrial (oxygen-contaminated) catalyst is much more effective than a clean nickel film, provided that the H⁺ species is an essential requirement for efficiency.

A second example is the oxidation of carbon monoxide by oxygen on a copper catalyst. As in the previous example, gases are added separately to the catalyst at a low temperature, and both the quantity of each gas chemisorbed and the corresponding work function changes are measured. The temperature is slowly increased, when some carbon dioxide, the product of oxidation, and carbon monoxide are evolved; the amounts of the two gases desorbed and the accompanying change of work function are recorded. Possible structures of the complexes remaining at the surface can now be postulated and the calculated estimates of the changes of work-function are compared with that actually obtained. In this system, only two or three structures for the rest of the complex on the surface remain. Finally, fresh gas, the nature of which is chosen such that chemisorption should take place with a known change of work function, is then added. If the experimental facts then accord with the forecast, the sequence of events is a reasonable and consistent one. This is illustrated in Fig. 7, where the process of separate absorption (*a*), (*b*), partial desorption (*c*) and re-adsorption of carbon monoxide (*d*) is depicted with the corresponding experimental values of the work-function.

In the past five years, another powerful technique, in which infra-red spectroscopy is employed to elucidate the structure of surface complexes, has been successfully exploited. Advantage is taken of the fact that frequency of vibration of atoms in molecules is specific to a particular bond and its immediate environs, and this may be identified as a band in the infra-red spectrum.

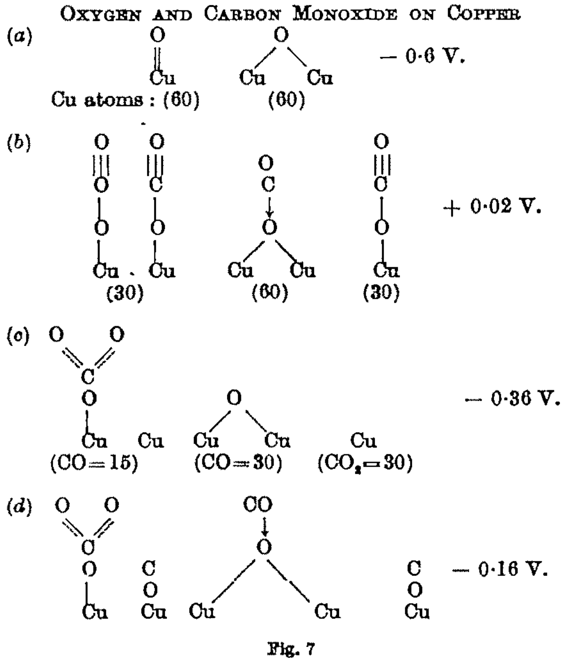

Fig. 7

The major difficulty in the application to chemisorbed substances is the requirement that there must be a comparatively large number of molecules in the light beam before the spectrometer can 'see' the bands. Eischens has recently shown this to be possible by depositing the metal on exceedingly fine particles of non-porous silica, which itself is reasonably transparent to infra-red light. Already, three different forms of binding of carbon monoxide to metal surfaces have been recognized, all of which have their analogues in the well-known free molecules, the metal carbonyls. Furthermore, the concentration of each structure can be determined from the intensity of the infra-red band; in particular, when hydrogen is adsorbed 'on top' of a chemisorbed carbon monoxide layer, there is no loss of intensity of the CO-band such as would result from combination of CO with hydrogen, nor do any new bands attributable to CH or OH or CHO bonds appear. These results confirm the conclusion drawn from the experiments on the work-function which suggested the hydrocarbonyl structure.

There are still many formidable experimental problems to be solved before the full power of the infra-red technique can be exploited for studying chemisorption. One aspect, where its usefulness has already been indicated, is the investigation of the non-uniformity of the surface. The bonding is undoubtedly different at certain 'active patches', and by noting the change in frequency of the infra-red bands, the surface may be 'scanned'.

This non-uniformity at the surface arises in part from the imperfect structure of the solid. The electron diffraction experiments of Laue *et al.* in 1912 were accepted as the first experimental proof of the theoretical concept of a crystalline solid as a perfect, orderly, three-dimensional array of atoms; but in 1914 Darwin directed attention to the intensities of the pattern, which were 10–100 times too large for diffraction from a perfect array. His suggestion of a large number of small crystallites imperfectly aligned and cemented together has finally led to the recognition of dislocations as general imperfections of all solids. However, in addition, crystals have their maximum stability when the lattice has vacancies (atoms missing from lattice sites) and interstitials (atoms squeezed into abnormal positions between lattice sites). Physical chemists interested in the chemical reactivity of solids now regard the nature and number of these imperfections as being of greater significance than the particular geometrical arrangement of atoms in a crystal.

With an ionic crystal such as sodium chloride, there are both cation and anion vacancies carrying opposite virtual charges, and having mobility. They therefore tend to attract each other to form neutral double vacancies and higher aggregates. Indeed, the solid may be regarded as the solvent and the point imperfections as the ions, and then such electrochemical terms as association constants, ion-pairs, solubility product, transport numbers, etc., may be applied and interpreted. Where there are abnormal electric field gradients, such as exist in the neighbourhood of dislocations, vacancies and interstitials can be directed to specific localities—indeed, the dislocation can give birth to point imperfections and also become their burial ground. It is therefore reasonable to associate the preferential reactivity of solids at certain unique localities with the presence of imperfections. Such abnormal regions may be made visible by certain etching and decoration techniques and may well represent, at the surface, the 'active centres' of the Taylor school of catalysis.

Within the solid, the dislocations provide paths along which atom or ion movement can occur more readily: they are localities where atom (ion) re-arrangement is easier; and they represent positions where a product of reaction finds space for precipitation and aggregation.

Many of these concepts have been applied to the mechanism of the thermal decomposition of solids, in particular metal azides, which, when heated, decompose to metal and nitrogen. In these compounds, the formation of point imperfections has been followed, their combination and aggregation recorded, and, finally, the details of growth of the metal speck analysed. From ionic conduction, the number of imperfections and their speed of movement through the lattice have been calculated; from the electronic conductivity under ultra-violet irradiation, the number of free electrons and their trapping probability have been assessed; and other information has been obtained from absorption spectra and electron spin resonance.

In all, the recognition of the role of imperfections has not only gone a long way towards the solution of the problem of how mass and charge are transferred in a solid but has also suggested the use of a large number of new techniques to further the study of this complex problem.

CHROMOSOMES IN PRIMARY NEOPLASTIC GROWTH

By DR. K. BAYREUTHER*

Institute for Cell Research and Genetics, Karolinska Institute, Stockholm

IT was the German embryologist Theodor Boveri who first aroused interest in the chromosome constitution of tumour cells. On the basis of studies on abnormal chromosome segregation and the resulting disturbances in the early larval development in dispermic fertilized sea urchin eggs, Boveri formulated the hypothesis that the malignancy of the mammalian somatic cell might be the result of a certain aberrant chromosome constitution[1]. The early efforts to test this concept yielded no conclusive information, however, mainly on account of inadequate methods.

During recent years critical facts have been collected by means of improved techniques about the chromosome cytology of various tumours. As a result discussion about the significance of aberrant chromosome constitutions in cancer cells has been revived. Several investigators consider that karyotype instability is not essential for the acquirement of neoplastic properties[2]. Others regard genetic variation at the chromosomal level as the cause of neoplastic transformation or at least indispensable for tumour progression[3]. The view of the latter group is mainly based, however, on results from material which is not truly representative of primary tumours.

With these opposing views in mind, karyotype analysis has been undertaken in some spontaneous tumours, virus-induced tumours, tumours caused by endocrine imbalance, and chemically induced primary tumours in various species including the domestic fowl, mouse, rat, Chinese hamster, domestic rabbit, cattle and man. The results obtained will be outlined.

Observations on Tumour Cells

Spontaneous primary tumours which were entirely untreated were studied in mice, cattle and man. As can be seen from Table 1, 68 out of 78 (87 per cent) neoplasms analysed revealed the species-specific and sex-specific normal chromosome complement. The majority of the experimental tumours were collected at the earliest possible stage of development and then showed mostly normal chromosome complements. Abnormal chromosome constitutions were as a rule restricted to tumours of large size. Frequently these showed several cell-types with numerically and structurally different abnormal chromosomal constitutions, often with no predominance of any one type.

A quite different picture was obtained, however, when primary spontaneous leukæmia cells with the normal chromosome set from mesenteric lymph glands of four *AK*-mice were separately transplanted to four animals of the same strain. The karyotype integrity was lost in three of the four lines in the first passage. During four subsequent transplantations the line which was normal in the first passage remained so, and the other three lines, which at the first passage contained a wide range of karyotypes, were in the fifth passage predominantly populated by a single line-specific abnormal cell type in all sites.

These findings indicate first that gross chromosome re-organization seems not to be essential for the acquirement of malignancy in spontaneous neoplasms, and that differences in the degree of malignancy as in the case of acute and chronic leukæmia in man cannot be ascribed to a diversity in chromosome complement. Secondly, they suggest that the abnormal constitutions are of secondary nature and arise spontaneously in the course of tumour development presumably as a consequence of neoplastic changes on other levels, and that the cytogenetic stem-line concept[4] has no general validity in the primary spontaneous tumour growth. Finally, they show that the chromosome mechanisms in the primary growth of spontaneous leukæmia may be quite different from those in the transplantation growth.

Virus-induced Tumours. Virus-induced neoplasia was studied in four species of experimental animals,

	Chronic lymphatic leukæmia	1	1	1	127	—	—

the domestic fowl, the mouse, the rat and the domestic rabbit. Chickens two weeks of age were inoculated with the erythroleukæmia virus. In the final stage of the disease erythroleukæmia cells in the femoral bone-marrow and in the spleen showed the normal 12 macrochromosomes in five male animals (total number of cells analysed $(t) = 500$, number of cells with chromosome numbers less ($<$) than the standard number $(st) = 18$, number of cells with chromosome numbers greater ($>$) than $st = 6$), and the normal 11 macrochromosomes in five female specimens ($t = 500$, $8 < st$; $4 > st$). Cells with the normal macrochromosome complements predominated also in three fibrosarcomas in male fowls ($t = 150$, $4 < st$) and in three fibrosarcomas in females ($t = 150$, $3 < st$; $2 > st$) induced by the Rous agent, and in three myxosarcomas in males ($t = 150$, $9 < st$; $2 > st$) and in two myxosarcomas in females ($t = 100$, $1 > st$) caused by the Fujinami virus. Besides the macrochromosomes about 60 additional microchromosomes were found in all tumour cells in both sexes. Because of their small size and similar form a reliable numerical and structural analysis of the latter elements is, however, not possible.

A very similar general picture was obtained from six virus tumour systems in mice and rats (Table 2): Here 75 out of 76 (98 per cent) primary and secondary tumour sites in the initial host were normal, and in addition three out of five virus-induced tumour lines, both solid and ascites, that were transplanted, also showed the normal species-specific and sex-specific chromosome complements. Thus it seems very unlikely that the tumour viruses cause neoplastic transformation via chromosome mutation. On the other hand, an abnormal genetic constitution of the host cell does not necessarily disturb the interaction of the virus and the host cell. The decreased virus titre in the transplanted reticulum cell sarcoma line (*Sq1B*)[5] may indicate that genetic variation can eventually lead to an abnormal constitution more favourable to the virus action, so that less virus is needed for a more efficient tumour growth.

Shope fibroma virus inoculated into five animals two weeks of age caused a lethal inflammatory, fibrosarcoma-like disease, while in four rabbits sixteen weeks of age the same virus sample induced benign fibromas only. The fact that both types of neoplasms, the fibrosarcoma ($t = 150$, $5 < st$; $2 > st$)

Table 2. Chromosomes in Virus-induced Tumours in Mice and Rats

and the fibroma ($t = 120$, $3 < st$; $2 > st$), were composed almost entirely of cells with the fourty-four normal rabbit chromosomes may indicate that the degree of malignancy is not necessarily determined by the chromosome make-up of the tumour cell, but might possibly be the result of differences in the physiological state of the host. In contrast the benign papillomas in five animals caused by Shope papilloma virus had normal chromosome complements ($t = 250$, $11 < st$; $7 > st$), but after malignant transformation every resulting primary carcinoma in five animals was characterized by a different hyperdiploid chromosome complement ($t = 122$). In addition the $V \times 2$ (Rous) tumour, derived from a Shope carcinoma by transplantation for about twenty years, had fifty-eight chromosomes ($t = 92$). It may be, therefore, that the interaction between the papilloma virus and the normal genotype results in a benign tumour only, whereas an altered cell may allow the virus to cause a malignant growth. It is still undecided, however, whether the abnormal chromosome constitutions detected in the primary carcinomas represent the cytogenetic basis for the malignant growth or if they are only superimposed on changes at other levels.

Tumours induced by endocrine imbalance. The third group of neoplasms analysed are those produced by experimentally provoked endocrine imbalance. Such tumours are usually hormone-dependent during the earlier stages and will often regress if the causative imbalance is corrected. Dependent tumours tend to change to autonomous forms either in their initial hosts or after serial passages in preconditioned animals. It was interesting to see whether the intracellular changes during the acquirement of hormone-independence result in the appearance of a new genotype.

Seven male mice castrated at one month and receiving œstrone in drinking water developed hormone-dependent pituitary tumours after an average time of 16 months. All tumours had the forty normal mouse chromosomes ($t = 107$). During the course of serial transplantation in preconditioned animals, pituitary tumours can become independent. Two such tumours, the *AtT*-20-Furth, and the *TtT*-3052-Furth, have been examined. The *AtT* tumour had the normal forty chromosomes ($t = 90$). The *TtT* tumour had sixty-five chromosomes with three long metacentric markers ($t = 60$). Since both tumours had been serially transplanted after the transformation to full autonomy, the implication of the abnormal constitution in the latter tumour, however, cannot be clarified.

Mammary tumours induced by endocrine imbalance and supposedly virus-free represent a more favourable material for the elucidation of this question, since such tumours are in general hormone-independent in the original host when of macroscopic size. Eight out of nine independent tumours resulting from hormonal imbalance elicited in four different ways had the normal chromosome constitution ($t = 322$). Finally, normal chromosome sets prevailed in both phases of evolution in the endocrine tumours studied. Thus gross chromosomal re-organization does not seem to be causally related to the intracellular changes resulting in full autonomy. The abnormal chromosome constitutions detected are probably of secondary nature, since in general, hormones lack mutagenic activity[6].

Chemically induced tumours. The chromosome constitution of neoplasms induced by six different chemical carcinogens has been analysed in detail. Four of the substances used are chemical mutagens (9 : 10 dimethyl-1 : 2 benzanthracene, ethyl carbamate, 20-methylcholanthrene, 3 : 4 benzpyrene), whereas the remaining two (2 acetylaminofluorene, 4-dimethylaminoazobenzene) lack mutagenic activity[7]. As can be seen from Table 3, no correlation between the mutagenic property of the inducing carcinogens and the chromosome constitutions of the resulting tumours was found. In every case, however, when carcinogens were administered systemically or locally under similar conditions, the tumours that resulted from systemic administration (Table 3, Nos. 1, 2, 3) had fewer chromosomal abnormalities than those resulting from local and prolonged administration (Table 3, No. 4, 5, 6), regardless of the mutagenic property of the substances used. Since almost all abnormal tumours also contained some tumour cells with the normal karyotype, it seems reasonable to assume that gross chromosomal reorganization is not essential for acquiring neoplastic properties in chemical carcinogenesis. The quantitative predominance of tumour cells with the normal chromosome complement in benign (Table 3, No. 2) and smaller malignant tumours (Table 3, No. 3, 4) and of abnormal cells in larger malignant tumours (Table 3, No. 3, 4) demonstrates furthermore that the abnormal constitutions can only be of secondary nature.

Radiation-induced tumours. Karyotype studies in primary lymphoid tumours that developed in non-irradiated thymic implants residing in an irradiated environment and in thymus *in situ* as a consequence of direct whole-body irradiation have yielded contradictory results[8]. In spite of this conflict, however, there seems to be agreement that the abnormal chromosome complements are of secondary importance, since several well-documented features of leukæmia-induction rule out the possibility that the neoplastic transformation results directly from the mutagenic effect of radiation[9].

The picture evolving from the analysis of primary tumours is still incomplete. It consists of outlines which must be filled in by further work. Nevertheless, the results reported are inconsistent with the chromosome mutation theory of carcinogenesis. The marked predominance of normal chromosome complements and normal deoxyribonucleic acid values that were found in representative material from precancerous stages, benign tumours and in the majority of early malignant tumours, both spontaneous[10] and induced by viruses[11], hormone imbalance, chemicals, and radiation[12], demonstrates that genetic variation at the chromosome-level need not necessarily precede the malignant change. In consequence it is reasonable to suggest that the abnormal chromosome patterns which characteristically occur in the majority of well-advanced tumours are of secondary importance in the acquirement of malignant properties. Furthermore, since the chromosome changes may occur at any time after the malignant change, they are probably a separate event. They may not be caused directly by the tumour-inducing agents and there is also little correlation between the mutagenic and carcinogenic activity of tumour-inducing agents. Once established, such new chromosome and hence genetic constitutions may confer some advantages on the cancer cells for tumour progression.

I am indebted to Drs. O. C. Broberger, T. Caspersson, C. D. Darlington, L. Engstedt, Ch. Friend, A. Graffi, L. Gross, R. J. C. Harris, G. Klein, P. C. Koller, B. Lagerlof, E. C. Miller, J. A. Miller, O. Mühlbock, Ch. Oberling, B. M. Richards, J. Schultz, R. E. Shope, M. Simonsen, S. Sorof, S. E. Stewart and B. Thorell, who encouraged me with their advice and interest and provided me with animals and tumour material.

This work was supported by grants from the Swedish Cancer Society, the Wallenberg Foundation, and the National Cancer Institute (National Institutes of Health, U.S. Public Health Service).

THE LIVERPOOL GEOLOGICAL SOCIETY, 1859–1959

By R. G. C. BATHURST

Department of Geology, University of Liverpool

IN 1859, on December 13, nine amateur geologists founded in Liverpool a small society, limited to eighteen 'ordinary' members, "To investigate the structure of the Earth, the character of its past inhabitants, and the changes now in progress upon its surface". Almost at once, local enthusiasm led to an abandonment of the limit on ordinary membership and by 1863 this had reached fifty-eight.

Upon the wider geological scene in 1859 had burst Darwin's "The Origin of Species", with profoundly stimulating chapters on geology. In the same year, work in the Brixham caves and in Abbeville had shown beyond a doubt the association in undisturbed sediments of flint implements with extinct Mammalia. All these matters were discussed in the young Liverpool Society. Nearer Liverpool, North Wales and Merseyside had been mapped by the Geological Survey. Sorby, inspired by the work of William Nicol, had introduced the microscopical examination of thin sections as a tool in geological research.

Before 1859, the Liverpool geologists had read papers to several local societies; but that year, led by G. H. Morton, they founded their own. Other similar associations already existed: in Edinburgh (founded 1834), Yorkshire (Wakefield) and Manchester (1838), Glasgow and London—the Geologists' Association—(1858). Others were to follow: Norwich 1864, Leeds 1873 and Hull 1888. The early Liverpool members, such as are recorded, included a solicitor, a baker, a cotton broker, a coal merchant, a cleric, three teachers, a museum assistant, two civil engineers, a customs officer, a medical practitioner, a building contractor and an analytical chemist—a range of occupations differing little from that of the present amateur membership.

From 1860 meetings were held in the new Public Library, but, after 1864, in the Royal Institution, and in recent years in the Department of Geology in the University of Liverpool. From the outset the business at meetings consisted of papers, exhibits and discussion, nearly all flowing from the work of the members themselves. The number of ordinary meetings a year has been about seven since the 1860's, and field-meetings are still actively supported.

Over the years that followed, members worked mainly on the local Trias, including the Storeton footprints of *Cheirotherium*, the local Quaternary, the Mersey estuary, changes in local topography and the water supply. Field-work was also carried out in more distant areas, and a number of studies of thin sections had been made by the turn of the century.

In the years before 1914, four men particularly influenced the progress of the Society, both as its officers and as geologists. George Highfield Morton, the founder and first honorary secretary (at the age of thirty-three), is remembered above all as the pioneer of Carboniferous Limestone stratigraphy in North Wales. His division of the Limestone into the Upper Grey, Middle White and Lower Brown is still used. Among earlier works is a detailed study of the Shelve district. He read sixty-one papers to the Society on a great variety of topics, and his clear microscopical descriptions of local sedimentary rocks were among the earliest attempted. His book, "The Geology of the Country around Liverpool", was first published in 1863. He was awarded the Lyell Medal of the Geological Society of London in 1892.

Henry Charles Beasley worked mainly on the local Trias, especially the Storeton footprints. At his suggestion, in 1886, a unique collection of photographs, now in the Society's library, was begun of "interesting sections and phenomena which are likely to be soon hidden from view". Seventy years later the photographs of, then, obscure sedimentary structures and of animal tracks in the Trias have proved of great value in recent research.

The work of Thomas Mellard Reade revealed a catholicity of interest and an insight which were to earn him the Murchison Medal of the Geological Society of London in 1896. Although his local work was considerable, he is better known for his pioneer quantitative studies on the importance of solution as a factor in erosion, based on an analysis of the suspended load of the Mississippi and other large rivers, and his book "The Origin of Mountain Ranges" (1886). In this work Reade argued that the deformation of the crust seen in mountain ranges could not be accounted for by the thermal contraction of the Earth and he developed a theory of differential heating of the crust. This local heating would cause the expansion sufficient to cause the observed difference. The subsequent discovery of radioactivity, and recent calculations on the rise of temperature which would result from the accumulation of great thicknesses of sediment, make Mellard Reade's theory much more plausible to-day than it seemed some years ago. Later, during the construction of the Mersey railway tunnel, the levels were lowered following his prediction, afterwards confirmed, of a buried channel under the Mersey.

Joseph Lomas collaborated with Herdman as petrologist in the still valuable report "The Floor Deposits of the Irish Sea". In 1886 he was appointed lecturer in the University College of Liverpool. In his study of glaciology he visited the Faröes and several times went to Switzerland. His visit to South Africa with the British Association led to a paper on the desert origin of the Trias.

In 1915 the Society published a monograph, by T. H. Cope, "On the Igneous and Pyroclastic Rocks of the Berwyn Hills".

From the beginning the Society has taken an active interest in the Liverpool City Museum, and has recently expressed its concern over the absence of a keeper of geology. The Society early pressed for a chair of geology in the University of Liverpool, which has received from the members some valuable geological collections.

During the inter-war years, after the appointment of P. G. H. Boswell as the first professor of geology in the University, the Society experienced a new surge of activity, though research was increasingly dominated by the professional geologist. Prof. Boswell and his students contributed a series of papers to the *Proceedings* on the Silurian of North Wales, and Boswell laid before the Society his reports on the geology of the Mersey road tunnel. G. H. Mitchell and Howel Williams published work on Ordovician volcanics and Alan Wood on the stratigraphy of the North Wales coalfield. Papers by E. Neaverson included a detailed study of the Carboniferous Limestone of North Wales. C. B. Travis was an active member, also editor, at this time.

T. A. Jones was the most recent of the outstanding amateurs. His detailed and extensive knowledge of local Quaternary and Triassic lithology enabled him to interpret many local borehole records. His outstanding single work, published just after the First World War, was a microscopical examination of the local Carboniferous Limestone. He demonstrated the important role of micro-organisms, especially Foraminifera, in its formation.

The Society owes its survival through the Second World War pre-eminently to the efforts of T. A. Jones and E. Montag, with D. Alan and W. Schofield as editors.

In 1918, the Society established a Medal to be awarded to any geologist for work bearing upon the interests of the Society, an award to a member for original work on the local geology, and a prize to go to a student in the University of Liverpool.

Proceedings have been published since 1861, and by their exchange a large collection of foreign periodicals has been amassed. In recent years the financial survival of the *Proceedings* became difficult, in spite of help from the Royal Society during many years. To overcome this difficulty the Society joined with the Manchester Geological Association in 1951 to found the *Liverpool and Manchester Geological Journal.*

The new *Journal* differs somewhat from the *Proceedings*. In the first half-century, nearly three-quarters of the authors were members, and this high figure was maintained between the Wars; but since 1951 fewer than half have been members. There is now therefore a tendency for papers to deal more often with material beyond the traditional Liverpool area. The papers are less frequently read at ordinary meetings, at which lectures are generally given instead by invited speakers, often from outside the district. The wider scope of the Society's work was marked in 1959 by the removal from the "Object of the Society" of a final clause, "with particular reference to Liverpool and the surrounding area", which had been added in 1917.

In the face of rising costs, the joint publication too has had a precarious existence. Following appeals to local industry, the *Journal* has been generously helped, especially by Imperial Chemical Industries, Ltd. Advertisement overseas has recently led to an encouraging increase in subscribers, a sign of the growing strength of the *Journal* during its first decade under the editorship of J. C. Harper.

The centenary of the Society was marked by a three-day meeting, during January 1–3, jointly with the eighth Inter-University Geological Congress, at which ten addresses were delivered on recent advances in geology to an audience of more than two hundred. These addresses have been published in the centenary issue of the *Journal*.

NEW FELLOWS OF THE ROYAL SOCIETY

AT a meeting of the Royal Society on March 24, the following were elected to fellowship of the Society:

MR. A. M. BINNIE, reader in engineering in the University of Cambridge, distinguished for his contributions to engineering science, particularly in the field of hydraulics.

PROF. R. HANBURY BROWN, professor of radio astronomy in the University of Manchester, Jodrell Bank Experimental Station, distinguished for his many contributions to radio astronomy particularly on galactic and extra galactic radio emissions.

PROF. D. G. CHRISTOPHERSON, professor of applied science in the University of London, Imperial College of Science and Technology (Department of Mechanical Engineering), distinguished for his researches into the deformation and cutting of metals and for his work on explosive weapons.

PROF. R. H. DALITZ, professor of physics in the University of Chicago, Enrico Fermi Institute for Nuclear Studies, distinguished for his numerous contributions to nuclear theory and the physics of elementary particles.

PROF. J. N. DAVIDSON, Gardiner professor of physiological chemistry in the University of Glasgow, distinguished for his work on the structure, distribution and biosynthesis of ribose nucleic acid and deoxyribose nucleic acid.

PROF. M. J. S. DEWAR, professor of chemistry in the University of Chicago, distinguished for his studies of chemical structure and for his contributions to the application of quantum theory to organic chemistry.

SIR STEWART DUKE-ELDER, ophthalmic surgeon and director of research at the London University Institute of Ophthalmology, distinguished for his contributions to ophthalmic medicine, pathology and physiology.

DR. L. ESSEN, deputy chief scientific officer at the National Physical Laboratory, Teddington, Middlesex, distinguished for his work on the precise measurement of frequency and of the velocity of light.

DR. D. G. EVANS, director of the Medical Research Council Biological Standards Control Laboratory, London, distinguished for his investigations on the pathogenesis and prophylaxis of anærobic wound infections and whooping cough, and for his work on biological standards.

MR. N. L. FALCON, chief geologist of the British Petroleum Company, London, distinguished for his researches in tectonics and stratigraphy in connexion with the exploration for oil.

DR. P. A. GORER, reader in experimental pathology in the University of London (Guy's Hospital Medical School), distinguished for his work on the immunological genetics of tissue transplantation.

PROF. O. V. S. HEATH, professor of horticulture in the University of Reading, distinguished for his work in plant physiology and in particular the mechanism of stomata.

DR. R. HOLROYD, a deputy chairman of Imperial Chemical Industries Ltd., London, distinguished for his work on the chemistry and engineering of synthetic fuel production.

DR. H. E. HUXLEY, member of external staff of the Medical Research Council, Department of Biophysics, University of London (University College), distinguished for his work on the fine structure of muscle and on the mechanism of muscular contraction.

DR. J. C. KENDREW, deputy director of the Medical Research Council Unit for Molecular Biology, Cavendish Laboratory, Cambridge, distinguished for his work on the three-dimensional analysis of myoglobin by direct X-ray diffraction methods.

DR. J. A. KITCHING, reader in zoology at the University of Bristol, distinguished for his contributions to the physiology of protozoa and to marine ecology.

DR. D. K. C. MACDONALD, principal research officer, Division of Pure Physics, National Research Council of Canada, Ottawa, distinguished for his investigations on the thermal and electrical properties of metals with particular reference to the study of electron interactions.

SIR GEORGE PICKERING, regius professor of medicine in the University of Oxford, distinguished for contributions to clinical science, in particular to our knowledge of the causes of high blood-pressure.

PROF. G. PORTER, professor of physical chemistry in the University of Sheffield, distinguished for his work on flash photolysis and its applications to the study of free radicals and chemical processes.

DR. K. F. ROTH, reader in mathematics in the University of London (University College), distinguished for his solutions of fundamental problems in the theory of numbers.

PROF. T. R. SESHADRI, professor of chemistry in the University of Delhi, distinguished for his studies of the chemistry of naturally occurring compounds, particularly flavonoids.

PROF. J. H. TAYLOR, professor of geology in the University of London (King's College), distinguished for his researches into the geology of ore deposits, particularly the iron ores of the Midlands.

DR. A. A. TOWNSEND, assistant director of research in the University of Cambridge, Cavendish Laboratory, distinguished for his experimental and analytical contributions to the theory of turbulent motion in fluids.

PROF. R. L. WAIN, professor of agricultural chemistry in the University of London (Wye College), distinguished for his research in plant auxins and systemic herbicides.

DR. E. N. WILLMER, reader in histology in the University of Cambridge, distinguished for his work on cells, their growth and metamorphosis, and on colour vision.

NEWS and VIEWS

Ministry of Aviation Appointment:
Mr. D. G. A. Rendel

MR. DAVID RENDEL has been promoted to deputy chief scientific officer and appointed head of the Mechanical Engineering Department of the Royal Aircraft Establishment. He was educated at Downside School and New College, Oxford, where he took an honours degree in engineering science in 1940. He joined the Royal Aircraft Establishment, Farnborough, in the summer of that year, and in 1941 was given the task of organizing a laboratory to deal with hydraulic and pneumatic power services in aircraft. This was during the period when high-pressure hydraulic and pneumatic systems were being increasingly used in aircraft and power-operated controls were being developed. Mr. Rendel was responsible for studying a number of basic problems such as the effects of oil aeration on hydraulic controls, high-pressure air flow in small pipes, behaviour of irreversible machines, etc. In 1948 he was appointed technical assistant to the Director-General of Technical Development (Air), Ministry of Supply, and served in that post during the early stages of development of V bombers, the *Hunter*, the *Javelin*, the *Brabazon*, the *Princess* and *Viscount*; also at this time the *Avon*, *Mamba*, *Dart* and *Sapphire* engines were being developed and the first operational guided weapons were being designed, together with the more advanced navigational aids which are now just coming into service. During his last year with the Director-General he was responsible for the administration of Ministry of Supply activities in the joint American, British, Canadian Air Force standardization scheme.

Issues of *Nature* are now being grouped into four volumes a year. This issue is the first number of Volume 186

On his return to Farnborough, in 1951, he served in the Mechanical Engineering Department, controlling work on aircraft pressure cabins, aircraft conditioning, aircrew equipment and escape and safety, and was responsible for Farnborough's contribution to the development of the modern oxygen breathing and pressure clothing equipment now used by Service aircrew. During this period he became interested in the subject of man-powered flight and is a member of the steering committee of the Royal Aeronautical Society group which interests itself in this subject. He was made a member of the Engineering Physics Sub-Committee of the Aeronautical Research Council and of the Instruments and Physics Sub-Committee of the Meteorological Research Committee.

National Maritime Museum:
Lieut.-Commander D. W. Waters

LIEUT.-COMMANDER D. W. WATERS, R.N., has been appointed curator of navigation and astronomy in the National Maritime Museum, Greenwich, London, in succession to Commander O. Hill. Lieut.-Commander Waters is well known for his book, "The Art of Navigation in England in Elizabethan and Early Stuart Times", which appeared in 1958, and is now the recognized authority on the subject. He served in the Fleet Air Arm and was taken prisoner by the Italians during a night torpedo attack in the Mediterranean in 1940. Since 1946 he has served at the Admiralty on the staff of the Historical Section, where he has been chiefly concerned with the history of problems connected with attack and defence of shipping. He is a Fellow of the Royal Historical Society and of the Institute of Navigation, and has written extensively on the history of navigation and maritime warfare.

College of Advanced Technology, Birmingham:
Mr. K. L. Stretch

MR. K. L. STRETCH has been appointed vice-principal of the College of Advanced Technology, Birmingham, as from June 1. At present, Mr. Stretch is director of the Central Engineering Establishment of the National Coal Board. He was educated at Merchant Taylor's School, Crosby, and at King's College, Cambridge, where he graduated in mathematics. After an engineering apprenticeship, broken by war service, with Mather and Platt and experience on the works and in design with Imperial Chemical Industries, he was works manager at the United Kingdom Atomic Energy Authority, Calder Hall, before taking up his present post in 1957. Mr. Stretch has undertaken research and development in fire and textile engineering, nuclear reactor characteristics and operation, tunnelling and non-destructive testing, and has written several articles on nuclear energy and fuel policy.

Commonwealth Scientific and Industrial Research Organization:
Executive Appointments

Two new part-time members to the Executive of the Commonwealth Scientific and Research Organization (Australia) are announced. The vacancies were created by a recent amendment to the Science and Industry Research Act, which increased the strength of the Executive from five members to nine.

The two members are Lord Casey, who recently resigned from Parliament on his elevation to the peerage, and Mr. E. P. S. Roberts, a prominent Queensland grazier. Lord Casey's association with C.S.I.R.O. dates back to 1937, when he first became minister-in-charge of the Council for Scientific and Industrial Research. Mr. Roberts, who is aged forty-six, has been associated with C.S.I.R.O. as a member of its Advisory Council since 1957. After the War, he purchased his own property at Toobeah, in Queensland, and became interested in the wider problems of the pastoral industries. His appointment will ensure that the point of view of the man on the land and the problems of northern Australia are kept constantly before the Executive.

Iron and Steel Institute: Awards

The Council of the Iron and Steel Institute has announced the award of the following medals and prizes: *Bessemer Gold Medal for* 1960: Prof. Hermann Schenck, director of the Institut für Eisenhüttenwesen, Rheinische-Westfälische Technische Hochschule, Aachen, Germany, and president of the Verein deutscher Eisenhüttenleute; *Sir Robert Hadfield Medal for* 1960: Dr. J. C. Hudson, head of the Corrosion Section, Chemistry Department, British Iron and Steel Research Association; *Andrew Carnegie Silver Medal for* 1959: Dr. P. R. V. Evans, Research Department, Metropolitan-Vickers Electrical Co., Ltd., Manchester, for a paper on "The Effect of Rolling Unstable Austenitic 0·76% Carbon Steel at 220–300° C." (*Journal*, January 1959, p. 34); his co-author, Prof. Hugh O'Neill, was not eligible for an award; *William Prize for* 1959: Mr. I. M. D. Halliday, Research and Development Department, The United Steel Companies, Ltd., Rotherham, for a paper on "Continuous Casting at Barrow" (*Journal*, February 1959, p. 121).

Mr. W. F. Cartwright, assistant managing director of the Steel Company of Wales, Ltd., since 1954, has been elected president of the Iron and Steel Institute for 1960–61.

Cost of the Radio Telescope at Jodrell Bank

In a written answer in the House of Commons on March 24, Sir David Eccles, as representing the Minister for Science, stated that there is nothing owing on the capital cost of the radio telescope at Jodrell Bank, and that the Government is not prepared to increase its contribution. The Government has already contributed substantially to the cost of upkeep of the telescope and any applications which might be made for further grants for research involving its use would continue to be dealt with on their merits by the Department of Scientific and Industrial Research. In oral replies Sir David said that the United States Government has already paid in full for work undertaken on its behalf with the radio telescope. Treasury approval for the final £130,000 of the total grant of £360,000 towards the capital cost of construction of the radio telescope was given on August 8, 1956, and payment to the University completed on March 17, 1958. Three further grants of £13,000 annually for 4 years, for running costs, £60,820 for development of new apparatus and techniques, and of £15,200 for galactic and extra-galactic neutral hydrogen emission studies and development of data-handling processes have been authorized. Sir David said he was not aware of any delay on the part of the Treasury in giving approval or by the Department of Scientific and Industrial Research in making the payments to the University. There was a sum of £60,000 left to be collected by the University of Manchester towards the capital cost and, referring to an appeal to the Government to subscribe this final sum, Sir David said that Lord Hailsham considers that the Government's contribution is sufficient and that it is well understood that the rest of the money will be raised by the University.

City and Guilds of London Institute Fellowships

The Fellowship of the City and Guilds of London Institute has been conferred upon the following past students in recognition of their contributions to industry or the professions in which they are engaged: J. J. Gracie (director and general manager of the G.E.C. Engineering Works at Witton, Birmingham); C. G. Hawes (consultant in hydrology and irrigation); T. M. Malkani (chief engineer of Calcutta Port Commissioners); H. D. Morgan (senior partner of Sir William Halcrow and Partners); D. W. Morphy (joint managing director of Morphy-Richards, Ltd.); and A. W. Skempton (professor of civil engineering, City and Guilds College, Imperial College of Science and Technology). The Council of the City and Guilds of London Institute has also conferred the fellowship of the Institute, *honoris causa*, upon: Sir Willis Jackson (president of the Institution of Electrical Engineers, director of research and education, A.E.I. (Manchester), Ltd.); Prof. D. M. Newitt (pro-rector of the Imperial College of Science and Technology), head of the Department and Courtauld Professor of Chemical Engineering).

Joint U.S.–Canadian Satellite Project

During April 1959, Dr. A. Hartley Zimmerman, chairman of the Canadian Defence Research Board, and Dr. T. Keith Glennan, administrator of the U.S. National Aeronautics and Space Administration, announced acceptance by the Administration of a proposal by the Defence Research Telecommunications Establishment for a joint satellite experiment. Initially, it was proposed that the satellite will be constructed and instrumented by the Defence Research Telecommunications Establishment and launched late in 1961 at Vandenberg Air Force Base by means of a three-stage *Thor–Delta* rocket provided by the Administration. The experiment will be designed to achieve two objectives. First, to examine and record information about the structure of upper levels of the ionosphere by using a radio sounder above the ionized layers. Secondly, to provide information about the radio signals which emanate from outer space. The satellite will be launched in a near-polar orbit, and for protection during its acceleration through the dense atmosphere, it will be enclosed in a metal nosecap or shroud. On reaching orbit altitude of 700 miles, both the nosecap and the third-stage rocket will be separated from the satellite. The Defence Research Telecommunications Establishment will operate four receiving stations in Canada. It is hoped that the satellite will continue to transmit data for about a year following the launching. The information is to be exchanged freely with other nations through the Committee on Space Research of the International Council of Scientific Unions.

Factories (Ionizing Radiations) Special Regulations

A revised draft code (Ministry of Labour. Factories Acts, 1937 and 1948. Factories–(Ionizing

Radiations)—Special Regulations—Second Preliminary Draft of Regulations. Pp. 20. (London: H.M. Stationery Office, 1960.) 1*s*. 3*d*. net) for the protection of workers engaged in operations involving the production, emission or use of ionizing radiations includes amendments based on many suggestions received since the first draft code was issued in July 1957. The preface comments on the more important changes made to the earlier draft. The "Schedule of Permitted Radiation Doses" has also been revised in the light of the views of the Medical Research Council and of the latest recommendations of the International Commission on Radiological Protection. Presumably the regulations must be phrased in language which meets legal requirements, but as they stand they will undoubtedly make difficult reading for factory officials and others who will be concerned in their implementation. It would be an enormous help to such readers if the regulations could, for example, be expressed with the clarity displayed in the "Code of Practice" (1957), which was intended primarily for the protection of persons exposed to ionizing radiations in hospitals in the National Health Service.

In view of the part played by the 'competent person' it is desirable that some definition of this term be given including the qualifications required. A particular reason for this is that the new draft does not require tests for personal exposure or medical supervision of those persons who, although employed in the operations mentioned above, remain outside adequate shielding, and it is presumably the 'competent person' who must establish whether or not the shielding is in fact adequate. The suggestion in 28 (1) that a worker, transferring his services elsewhere, should be given a copy of his own record from the health register seems fraught with some difficulty, especially because by 27 (1) it includes results of medical examinations. Comments on the new draft are invited from "industry, associations and any others concerned", to be sent to the Ministry of Labour by April 15.

British Museum (Natural History): New Exhibits

The pavilion beyond the Mammal Gallery in the Natural History Museum has been re-designed to show three groups of African game animals in their natural surroundings. The largest group is taken from the district north of Mount Kenya, with a giraffe family, a kudu and baboons coming to drink near the Guaso Nyiro river. The second group consists of an okapi and a bongo in a deep gorge in the Ituri Forest. Opposite to this is a scene in Angola, with a giant sable antelope surveying the country from the top of a termite colony. A brindled gnu and a pair of impala antelopes have been feeding in the dense grass below. A large contour map of Africa dominates the pavilion and shows the three localities depicted. The equipment of the pavilion is the gift of the Rowland Ward Trustees, in memory of the late Rowland Ward. Messrs. Rowland Ward, Ltd., have set up the three groups and provided most of the mounted animals. The okapi was specially provided for the Museum by the Governor-General of the Belgian Congo and mounted by the exhibition staff of the Museum.

A series of new cases lining the balcony on the east side of the Central Hall is devoted to exhibits illustrating the chief points in the functional morphology of mammals. Included are the skin and its derivatives, hair, spines, hoofs and glands; muscles, and adaptation of the external form and skeleton to various kinds of locomotion such as running, jumping, flying, burrowing and swimming; brains and sense-organs; the digestive, circulatory and respiratory systems; and an extensive series illustrating the structure, growth, adaptation of teeth to various types of food.

University Entrance in Great Britain

Under the title "University Entrance—The Basic Facts", the National Union of Teachers has published a concise guide for those who contemplate entering a university (London: National Union of Teachers, 1960. 3*s*. 6*d*.). Information regarding the universities themselves, the courses they offer, the educational requirements for admission, accommodation, cost of study and residence, etc., is first presented. Next follows a clear outline of the grants and scholarships available in Great Britain and Northern Ireland, and some notes are given on the various university, matriculation and faculty requirements. A novel and valuable feature of the guide is the list of universities showing in tables the subjects that may be studied either as part of a course leading to a first degree, or as the main part of such a course in which a degree can be taken either in that subject alone or in combination with one or two other principal subjects. The guide is thus admirably designed both to assist the school-leavers to determine where to train and to realize where their qualifications may lead. The Union is to be congratulated on an excellent job of work. Copies are being sent free initially to every maintained secondary school which prepares pupils for courses leading to university entrance, and additional copies are on sale to schools and members of the public.

Science and Economics in the United States

A survey "Current Projects on the Economic and other Impacts of Scientific Research and Development" was undertaken early in 1959 by the National Science Foundation of the United States, and an inventory of projects in colleges and universities has now been issued by the Foundation (Pp. v+59. National Science Foundation, Washington, D.C.: Government Printing Office, 1959. 25 cents). The 107 projects listed are classified in ten sections, comprising, for example, agriculture; expenditure for research and development; impact in selected industries; invention, innovations and patents; new sources of power and other case studies in scientific and technological developments; and sociological and man-power studies of research and development and technology. There are an author index and an index of institutions. Simultaneously the Foundation has issued "A Bibliography on the Economic and Social Implications of Scientific Research and Development" (Pp. v+53. (National Science Foundation. Washington, D.C.: Government Printing Office, 1959. 25 cents). The entries are arranged under the following headings: general background; nature, philosophy and history of science and technology; expenditure and man-power activities in research and development; associated institutional branches of science and technology, and public policy; patents and innovation, administration and management of industrial research; economic and social implications and analysis of research and development; and other bibliographies. There are an author and periodical index.

Harkness Fellowships of the Commonwealth Fund

The British Committee of Award of the Commonwealth Fund announces the following elections, among others, to Harkness fellowships for 1960, tenable for one or two years in the United States: G. S. G. Beveridge (Edinburgh to Minnesota), chemical engineering; R. Y. Calne (Royal Free Hospital to Harvard), surgery; B. Coleby (Low Temperature Research Station, Cambridge to University of California), food research; B. J. Deverall (Imperial College of Science and Technology, London to Wisconsin), plant pathology; J. E. Dove (Atomic Energy Research Establishment, Harwell to Harvard), physical chemistry; R. Hall (Royal Victoria Infirmary, Newcastle upon Tyne, to Harvard), medicine; A. M. Howard (*The Guardian* to Columbia), journalism; M. Kogan (Ministry of Education to Harvard), teacher training; D. Lynden-Bell (Cambridge to California Institute of Technology), astronomy; D. H. Mellor (Cambridge to Minnesota), chemical engineering; K. J. Reid (Cambridge to University of California), chemical engineering; I. C. Roddie (Belfast to Seattle), physiology; A. C. Rose-Innes (Admiralty to Rutgers), electronics; J. R. Taylor (Cambridge to University of California), nuclear physics; C. T. C. Wall (Cambridge to Institute for Advanced Study, Princeton), mathematics.

André Mayer Food and Agriculture Fellowships

The Food and Agriculture Organization of the United Nations has announced that it will offer 10 or 12 André Mayer fellowships during 1960. These awards, valued at 150–360 dollars a month depending on the country where they are used, will be made under the following two groups: *research*, for unusually promising persons with research experience behind them who would offer a guarantee for the carrying out of independent research work; *research training*, for younger and promising individuals who have demonstrated an inclination towards and an aptitude for research work. Due consideration will be given to geographical distribution, to ensure that a proportion of the awards is given to candidates from countries where research facilities are not highly developed and the need for trained research workers is great. The subjects presented must be in relation to the Organization's activities which comprise: land and water development, plant production and protection, animal production and health, rural institutions and services, fisheries, forestry and forest products, nutrition (non-medical), atomic energy in food and agriculture, agricultural economics (commodities, statistics, economic analysis). Further information can be obtained from the Secretariat of the Food and Agriculture Organization, National Committee for the United Kingdom, Ministry of Agriculture, Fisheries and Food, Whitehall Place (East Block), London, S.W.1.

The Canada Council

The second annual report of the Canada Council, which covers the year ended March 31, 1959, again stresses both the Council's difficulty in selecting recipients of grants and that a grant once made is not automatically renewable (pp. vi+112. Ottawa: The Canada Council, 1959). The report includes lists of scholarship awards made during the year and also special projects and grants-in-aid to individuals. During its two years the Council has made capital grants totalling 12,816,564 dollars to 31 different universities and colleges, including 1,632,600 dollars to the University of British Columbia, 1,377,141 dollars to Queen's University, Kingston, and 1,050,000 dollars to the University of Western Ontario. Under the Scholarship and Fellowship Scheme, 571 awards were made totalling, including travel grants, 1,216,000 dollars, and of these, 111 were in the arts, 236 in the humanities and 224 in the social sciences; and of the 79 senior fellowships, 23 were renewals from the previous year. Grants to organizations totalled 1,148,379 dollars in the arts, 120,772 dollars in the humanities and 167,440 dollars in the social sciences, and 75,000 dollars was earmarked to assist Canadian universities in bringing eminent scholars to Canada for short periods and for interchange of scholars between universities in Canada.

The Industrial Training Council

The first report of the Industrial Training Council covers the period from July 1958 to December 1959 (pp. 32. London: Industrial Training Council, 1960. 1*s*.). The Council's immediate task is to try to ensure that training arrangements in industry will be adequate to enable the best use to be made of the abilities of all the young people available for employment in industry during the next few years. The proper training of its workpeople is the responsibility of each industry, and the Council sees its main function as the encouragement of the employers' organizations and the trade unions in co-operation to take the necessary action. The Council is convinced that great scope exists for introducing systematic training in a wide range of industries to supplement traditional apprenticeship training of craftsmen. The bulk of the report comprises a summary of the action taken by some sixty industries, which together employ nearly two-thirds of all workpeople, to deal with the 'bulge', and nineteen industries known to be still considering the Carr Report are listed. The Council has also asked all industries to make some quantitative assessment of their future training needs for all the young workpeople they expect to recruit for whom a planned scheme of training is desirable; but although some industries have made such assessments, insufficient information is available to form any overall picture. The Council has accepted the Government's offer of a grant-in-aid to promote the expansion of training for young people in the circumstances created by the 'bulge' and particularly to assist the appointment of training development officers, and the Council has approved assistance under this arrangement to the Cotton Board and the Booksellers' Association and has agreed to a third grant to the Hotel and Catering Institute. The Council has also appointed its first two training advisers, and is now studying the information it has collected to decide what problems need more detailed consideration and what further information can usefully be distributed. Five working committees have been set up for this task.

National Museum of Wales

The year 1958–59 at the National Museum of Wales marked the retirement of Dr. F. J. North from the post of keeper of geology after a total service of more than forty-five years. The annual report quite properly pays high tribute to his services to the many tasks he undertook and the honours he received. Dr. North accepted the invitation of the Council to act for a while as a part-time special adviser to the newly formed Department of Industry. In the Geology Department the emphasis of the year's work was on the study and reserve collections; in the Botany Department an exhibit illustrating the mosses, liverworts and lichens has been installed; in the Zoology Department several important alterations have been made in the gallery of vertebrates; and the modernization of the galleries has continued in the Archæology Department. The Department of Industry appears for the first time in the annual report, and the generosity of many firms interested in this work is gratefully acknowledged. In the Art Department little radical change has been made in the display of the collections. At St. Fagans, Cilewent was opened to the public, who quickly appreciated the ideal siting of the house and the environs laid out to represent the contours and vegetation of the original place.

European Barley Tests

THE ninth annual report of the Barley Committee of the European Barley Convention deals with trials carried out in 1958 in fifteen European countries. Unfortunately, the widespread bad weather conditions reduced the value of the trials results because of the small grain with high nitrogen content. The malting quality was consequently much impaired, and brewing tests were abandoned. Judged on malting quality, there were some interesting new varieties: thus, Beka, Union and Wisa gave higher extracts than Proctor, which was the variety used as the standard for quality. Nevertheless, the general quality standard was so low that the report avoids a detailed summary of the performance of each variety, although it does make special reference to the capacity of the three varieties mentioned above to produce high extracts in spite of the most unfavourable growing conditions. Agriculturally, the important result emerging from these trials was the higher yields from the new varieties compared with the standard Kenia, which, however, has been outclassed in yield for some years.

These co-operative trials are interesting in giving some indication of the range of varietal adaptability, and it is claimed that much information is being accumulated on the influence of climate on the quality and yield of barley. A special research worker has been appointed to analyse the data available on this matter and to make suggestions for further investigations. This is an important development in the activities of the Barley Committee and might provide interesting and valuable information on the requirements of different ecological conditions with respect to the most suitable types of barley for the highest expression of yield and malting quality.

Research in Veterinary Science

EVERYONE who wishes well to the veterinarian, in whatever country he practises, or maintains the fine quality of research which this profession is nowadays producing, will welcome the first number of *Research in Veterinary Science*, which appeared in January this year (1, No. 1; January 1960. Pp. 93. Published quarterly. Annual subscription: 90*s*. post free. Single issues, 25*s*. Oxford: Blackwell Scientific Publications, Ltd., 1960). Inaugurated by the British Veterinary Association, this new journal has, as its executive editor, the editor of the Association's well-known weekly, the *Veterinary Record*, who has, to assist him, three distinguished scientific editors and also an editorial board composed of experts in practically every field of veterinary science, many of whom have won, by the quality of their work, high distinction in the world of science.

The aim of the journal, explained in a foreword by the president of the British Veterinary Association, is to fulfil Article 3 of the Association, which requires it to ensure "the promotion and advancement of veterinary and allied sciences"; and those who have followed the progress of the veterinary profession in recent years will expect to see, in the articles published, not only the wide scope mentioned by the Association's president, but also that note of comparative medicine and surgery which is nowadays a feature of veterinary science everywhere. Though diseases of animals are by their very nature especially allied to the diseases of man, a fact which is expressed in the increasing and wholly admirable co-operation between the veterinarian and the medical man, the veterinarian also needs, and energetically pursues, other branches of science as well, and the training he nowadays receives must fit him well to co-operate also in research in these. This journal will therefore reflect in its pages research in many branches of science and it will, as its inaugurators desire, have an international appeal; for veterinarians in other countries as well as Great Britain are invited to contribute to it. One thing is certain—this journal will be essential to anyone who wishes to follow the rapid advances that veterinary science is nowadays making everywhere.

Genetical Research

WHEN the oldest British general genetical journal left the country with its editor, only one such journal remained. This was doubly unfortunate. Not only was it a time when the pressure on space for publication was rapidly increasing in all fields, but it was also a time when the belated recognition by British universities that the Americans were right in recognizing genetics as an essential part of biology was beginning to have results. One journal of general genetics could not be enough for a country such as Britain, not only because of the bulk of publication to be expected, but also because of the desirability of having more than one editorial policy, however broad-minded that editorial policy might be. A new journal, *Genetical Research*, has now been launched to meet this need. Published by the Cambridge University Press, it is edited in Edinburgh by E. C. R. Reeve, with an editorial board, under the chairmanship of C. H. Waddington, who have a wide range of genetical experience. Three parts are to be published annually at 40*s*. each, the subscription being £5 a volume. The first number, of 172 pages, was published this February, and contains twelve papers ranging in content from micro-organism genetics to developmental genetics and the results of selection experiments. It includes a number of important papers among which should be noted especially Pritchard's discussion of recombination, and Waddington's experiments on canalizing selection. The contents of this first number augur well for the future of a journal that was badly needed, and is most welcome. We wish it the long successful future that it clearly merits.

Darwin's Notebooks

IN Darwin's Journal the year 1837 contains an entry which runs, "In July opened first notebook on 'Transmutation of Species'—Had been greatly struck from about month of previous March on character of

S. American Fossils—and species on Galapagos Archipelago. These facts origin (especially latter) of all my views". Sir Gavin de Beer has now transcribed the notebooks and the first of them dealing with the period July 1837—February has been published in the historical series of the *Bull. Brit. Mus.* (*Natural History*) (2, No. 2).

The four "Notebooks on Transmutation of Species" are the first implementation of the suggestion put forward by Darwin in his "Ornithological Notebook" referring to his visit to the Galapagos Islands in September and October 1835. The "First Notebook" represents the state of Darwin's opinion as it developed six months after his return to England, the results of consulting the literature on the subject, and the first formulation of his conviction that the stability of species had been 'undermined'. This "Notebook" is important in tracing the course of Darwin's thoughts and the extent of his knowledge before his cognisance of Malthus's work.

Food Habits of Migratory Ducks

In the autumns of 1938, 1939, and 1940, duck gizzards totalling 4,977 were collected from hunting clubs and individual hunters at twenty-one sites along the Illinois River between Ottawa and Florence and eleven sites along the Mississippi River between Rock Island and Quincy. The following seventeen duck species were represented: mallard, pintail, green-winged teal, blue-winged teal, baldpate, gadwall, shoveller, black duck, wood duck, lesser scaup, ring-necked duck, redhead, canvas-back, ruddy duck, greater scaup, common goldeneye, and oldsquaw (Illinois Nat. Hist. Surv. Bull., 27, Article 4; August 1959). Analyses of the gizzard contents were made by Harry G. Anderson and indicated that, during the autumn, most species of ducks in Illinois are predominantly vegetarians, that most of them feed principally on native wild plants, and that the lesser scaup is the only species with a diet predominantly animal. Maize made up half of the organic contents of mallard gizzards. Native wild foods were present in relatively greater quantities in gizzards of the wood duck, pintail, redhead, baldpate, green-winged teal, and ring-necked duck, all of which included maize in their diets.

The relative positions of the important food plants changed from year to year as accessibility and availability varied. The importance of a plant species to a species of duck depended on the size of the duck and the type of feeding habitat of the duck. The dabbling ducks fed primarily on emergent and moist-soil plants and the diving ducks more frequently on submerged plants. Animal foods were more important to the diving ducks than to the dabbling ducks Snails and mussels provided the largest animal food volume and occurred in the largest number of gizzards. Insects were second in volume and occurrence. Grit constituted about 11–28 per cent of the gross contents of the gizzards of various duck species. Most of the stones were less than 2 mm. in size; the sizes ranged from minute to 19 mm. in size. More than two hundred of the gizzards examined contained lead shot pellets.

British Scientific Instrument Research Association

At a recent meeting of the Optical Panel of the British Scientific Instrument Research Association, the members expressed the opinion that, with the advent of electronic computers, the conventional optimization methods used for optical design had probably achieved their maximum efficiency, and that there was now a deep-felt need for re-thinking at the fundamental levels of the problem. The director endorsed this view, and suggested that what was required was a new approach to the mathematical statement of the problem, leading, if successful, to an operational calculus or algebra embracing the whole field of design of optical systems. To this end the Association is now proposing to appoint a mathematician of the highest calibre, who will be given an entirely free hand in this field.

Announcements

Ralph E. McBurney, former air vice-marshal in charge of Air Material Command, Ottawa, has been appointed head of the Technical Information Service of the Canadian National Research Council. The position at the National Research Council is made vacant by the retirement of F. G. Green, head of the section since 1950.

It is announced that Prof. C. Salvetti has been appointed director of the International Atomic Energy Agency's Division of Research and Laboratories. Prof. Salvetti has been a consultant to the Agency, and will now be in charge of the Agency's activities in the field of research and the laboratories now under construction at Seibersdorf.

Miss H. M. Bruce, of the National Institute for Medical Research, London, has been awarded the Oliver Bird Prize for 1959 for a series of papers submitted under the general title of "An Exteroceptive Block to Pregnancy". The Prize is given by the Oliver Bird Trust (secretary, Mrs. Clifford Smith, 64 Sloane Street, London, S.W.1).

Dr. F. V. Webster, of the Road Research Laboratory, has been given the Wolfe Award for 1959. This is the second of ten annual awards of £500 to be made under the terms of a bequest, to a research worker of the Department of Scientific and Industrial Research who makes an outstanding contribution to the research work of the Department during the previous twelve months. Dr. Webster has been concerned mainly with the general settings of traffic signals, and has included the use of signals on high-speed roads and at traffic roundabouts.

We are informed that "Principles of Organic Chemistry" by T. A. Geissman, noticed in *Nature* of January 16, p. 131, is now available from the English branch of the publishers, W. H. Freeman and Co., Ltd., Hyde House, West Central Street, London, W.C.1, price 48*s*.

The British Leather Manufacturers Research Association, Milton Park, Egham, Surrey, will open its laboratories to invited visitors during May 3–5; the annual lecture on the first day (heavy leather industry) will be given by Dr. K. W. Pepper, director of the Association; that on the second day (light leather industry) by Mr. F. R. Morgan.

The Società Italiana di Fisica is organizing an international school of physics during May 23–August 17 at Varenna in the Villa Monastero. It will consist of four courses: Ergodic Theories, May 23–31; Nuclear Spectroscopy, June 20–July 9; Physicomathematical Aspects of Biology, July 11–30; and Topics of Radio-frequency Spectroscopy, August 1–17. Further information can be obtained from Prof. Piero Calderola, Istituto di Fisica dell'Università Via Saldini, 50 Milano.

HOW MANY MORE NEW JOURNALS?

AT a recent meeting of the Scientific Publications Council held at the Ciba Foundation, London, problems arising from the rapid increase in the number of new scientific journals were reviewed. Dr. D. J. Urquhart (Department of Scientific and Industrial Research Lending Library Unit) said that the number of journals taken by the Science Museum Library is increasing at the rate of about 700 a year, or nearly two new journals a day. Present indications are that with the development of new research institutions in China, Japan and other countries, this number is likely to go up to 1,000 or more new journals a year. The reason for the increase is that more money is being spent on scientific research. The increase in the number of journals does not mean that scientists are reading more: inquiry has shown that few individual scientists read regularly more than three or four scientific journals. Most of the smaller libraries take 100–300 journals and the number taken by them has not greatly increased in recent years.

Mr. T. H. Clare (director of Edward Arnold, Ltd.) said it was his personal experience as a publisher that new journals were often started without any expectation of an immediate financial return. A publisher might agree to start a new scientific journal mainly for reasons of prestige or because it might bring him into contact with the prospective authors of profitable books. A journal is less seasonal than many other forms of publication and it provides a useful way of keeping the skilled compositors regularly occupied and so spreading the publisher's overheads. The capital outlay required for the publication of a new journal is relatively small, and there is often a quick return.

Dr. B. M. Crowther (Institution of Electrical Engineers, and editor of *Physics Abstracts*) said that the number of scientific publications is increasing by about 5–10 per cent a year. Scientific information has generally been like an iceberg—with more below the surface than appears on top: but recently we have seen an unfortunate tendency to bring everything to the surface by publishing all the information available. Scientists have recognized the need for order in certain matters such as scientific nomenclature: there is now a need for general agreement in introducing more order into scientific publication. One thing calling for discipline is the habit of some workers of publishing the same material several times. The same work may appear first in a preliminary communication, then in various papers in national and international journals and again, with minor modifications, in congress reports and symposium volumes. Many of the increasing number of conference publications now appearing seem unnecessary: they contain little that is of permanent value and it might be better if they were not published. Conferences might be arranged for discussing recently published work, without the publication of further papers. Some of the smaller foreign universities start new journals apparently for the sole purpose of acquiring other journals by exchange, and many of these are practically valueless. If more work needs to be published, why not increase the size of some of the existing journals?

Dr. D. Richter (director of the Medical Research Council Neuropsychiatric Research Unit) said that while some publishers may play a passive part, there are others who are active in persuading scientists to start new journals. Some of the journals started in this way have proved successful; but with others the editors have found it hard to get sufficient good manuscripts to keep them going, so that standards have tended to fall. There should be sufficient journals to ensure the prompt publication of any worthwhile research: but not so many that there is reduplication and a lowering of standards. There is no means of enforcing any kind of control, but when the problem is more widely appreciated, public opinion may help to keep the number of journals at a reasonable level.

Dr. G. E. W. Wolstenholme (director of the Ciba Foundation) said that a major cause of reduplication is the insistence by university and other committees that those attending meetings should give a paper in order to get their expenses: but some of the more enlightened grant-giving bodies no longer insist on this. Temporary research grants also cause unnecessary publication, since a research worker may feel he must publish a paper to ensure the renewal of his grant.

Mr. A. V. S. de Reuck (international relations secretariat, Royal Society) blamed a tendency in some circles to judge a man by the quantity rather than the quality of the work he published. A higher standard of refereeing is needed to check reduplication and raise the general standard of publication. Prof. G. W. Harris (Postgraduate Medical Federation) asked what would be the result if scientists could be licensed and permitted to publish only one paper and one preliminary report a year?

Dr. R. K. Callow (National Institute for Medical Research) said that the abstractor often finds himself abstracting the same work two or three times; and much of the work coming from some countries is practically worthless. There is a need to return to scientific ethics in ensuring that a paper accepted for publication is really worth publishing. One cannot generalize about the value of conference reports: some of them provide an up-to-date summary of a subject which is extremely useful for those who wish to discover what is going on without the tremendous labour of looking up all the original papers. Dr. C. C. N. Vass (honorary editor *International Abstracts of Biological Sciences*) felt that we are reaching a stage where there is so much printed matter that nobody will read anything. He advised people always to take volume 1 of a new journal, for all the best papers were there. Often it was the only one worth buying, and in any event it would soon be unobtainable. Symposium and conference volumes present a special difficulty for the abstractor, since these may contain a mixture of reviews, original papers and preliminary reports which are very hard to disentangle.

Mr. R. W. David (president of the Publishers' Association) said the problem of too many journals falls into two parts. There is first the problem of scientists writing too much; and this can only be solved by the scientists themselves. They must agree to resist the blandishments of the less scrupulous publishers, who cannot be controlled in any other way. It is natural that publishers should be keen to build up scientific lists, and they may not really be capable of judging quality. The other part of the problem is that even if the scientists agreed to exercise due restraint, there would still be, and increasingly so, more material than can be digested in its present form by those for whom it is written. A revolution in the means of communicating scientific knowledge therefore seems inevitable. This may take many different forms: microfilming to save library space, abstracting, and the compilation of bibliographies to guide the reader to the essential reading. It would be helpful if scientists and publishers could get together to consider the directions in which these developments could most usefully be trained. D. RICHTER

HUMAN GROWTH

THE recently formed Society for the Study of Human Biology holds each year a symposium on some topic bearing on the evolution, ecology or genetics of man, and these annual events bid fair to become of very wide interest. This year the subject was "Human Growth," and seven papers were given, under the chairmanship of the Society's president, Dr. A. C. Stevenson, and its vice-president, Prof. J. Z. Young. The Society's programme secretary, Dr. G. Ainsworth Harrison, who planned the programme, deserves much praise for his skill in so successfully composing the various views of human growth into a synoptic whole. Some points that the speakers made are given below: the full account of the proceedings is to be published this summer (Pergamon Press).

Prof. Adolph Schultz (Zurich) opened the proceedings with a paper on the comparison of changes during growth in man, apes and monkeys. He emphasized the great importance of such comparative growth studies, pointing out that phylogenetic change results primarily from a modification in the inherited plan of growth or development. Thus an understanding of the evolution of the specific characters of man was largely dependent upon knowledge of the ontogeny of these characters among primates. For example, the cranio-vertebral joint was situated farther forward in man than in any other primate or even any other mammal. But this became an exclusively human attribute only during postnatal life, for the fœtuses of all simian primates, in contrast to prosimians and other mammals, were characterized by occipital joints situated far towards the mouth. Post-natally in apes and monkeys the joints were moved backward in position by differential skull growth; but in man this happened to a lesser degree.

In discussing prenatal growth Prof. Schultz showed how in monkeys and man the full-term fœtal head fitted the birth canal precisely, whereas in apes the head was considerably smaller than the pelvic ring. Thus in contrast to the apes, neither monkey nor man could afford to go on growing longer *in utero*. The reasons were probably different, however, for monkeys reached a higher degree of skeletal maturity at birth than apes, and presumably birth waited on this. Man, however, was even less skeletally mature at birth than apes, and in this case it was the great growth of the fœtal head that was the limiting factor.

These skeletal ossification data served well to show how evolution worked through alteration in the relative timing of patterns of growth, for the general sequence of appearance and fusion of ossification centres was similar in all primates; it was the timing in relation to other events of growth that differed. Prof. Schultz left no doubt in the minds of his hearers that longitudinal growth-studies of sub-human primates were a high priority in the investigation of human evolutionary change.

Dr. Wilma Israelsohn (Institute of Child Health, University of London) described some of the modes of analysis of human growth data, taking many of her illustrations from the data of the Harpenden Growth Study, which included a number of children measured by the same anthropometrist every six months over a period of eleven years. Dr. Israelsohn stressed the difference between such longitudinal studies and cross-sectional surveys, and emphasized how statistical methods appropriate to the survey type of data became hopelessly inefficient if applied unaltered to longitudinal records. She described some of the recent attempts to fit useful curves to longitudinal growth data, and said that at least two curves were needed to cover the period from birth to maturity. Up to adolescence the simple formulation, stature (for example) $= a + bt + c \log t$ where t was age, gave surprisingly close fits to the data, and after the adolescent spurt of growth had begun the Gompertz curve, also with three parameters, fitted excellently. More complicated form changes involving not one but several measurements could be followed by the method of transformed co-ordinate grids.

Dr. J. M. Tanner (Institute of Child Health, University of London) discussed the genetics of human growth. Like Prof. Schultz, he stressed how species, and also individual differences in adult morphology, depended on genetically determined differential growth gradients during fœtal and post-natal growth. He quoted data showing that the fundamental control of the rate of development in man was genetical; thus the age of menarche, the first menstrual period, was probably determined in optimal environmental circumstances by many genes of small effect, like stature. Mother–daughter and sister–sister correlations were about 0·4, and the average difference between identical twins in reaching menarche was about 2 months, compared to about a year in sisters. Skeletal maturity appeared to be similarly inherited, as did many of the more intricate details of the growth curves of body measurements. Dr. Tanner described three regional growth gradients as occurring in man, the well-known cephalocaudad one, a distal–proximal one in the limbs, and a second-to-fifth phalanx one in hand and foot. He ended with a brief account of his own and his colleagues' recent work on the skeletal maturity of XXY and XO individuals which, he thought, showed that the retardation of development in the male as compared to the female, seen in all primates and perhaps all mammals, was due to genes on the Y chromosome, possibly closely related to those causing differentiation of the male gonad.

Dr. D. F. Roberts (Department of Human Anatomy, University of Oxford), discussed the effects of race and climate on growth, as exemplified in his studies of tribal African children. At all ages the African children had a lower weight for height than Europeans, and this, Dr. Roberts thought, could not by any means be ascribed simply to lack of nutrition. The degree of weight reduction and linearity of body build was closely associated with the mean annual temperature of the region studied and reached its maximum in the Nilotics. Whether climate exerted a direct effect upon growth, or whether the results came about through racial adaptation to habitat through selection, Dr. Roberts could not say. He stressed the need for more detailed investigations of the growth of children in tropical countries, and for the investigation of children exposed to varying climatic conditions during their growth period.

Dr. Roy Acheson (Guy's Hospital) described the effects of malnutrition and illness on growth. Though some of the social class differences in the height and weight of children and adults might be genetical in origin and due to social stratification and selective social migration, most were due to environmental causes. Studies in the Oxford Child Health Survey of the effect of adverse environment on height and skeletal maturity had convinced him that the former was more affected by illness than the latter, with the probable consequence that some degree of stunting of the adult would occur. The hormonal mechanisms by which this came about were obscure, and invited increased attention; they evidently involved the balance of secretions of growth hormone, adrenal hormones, insulin and thyroid.

Prof. T. McKeown (Department of Social Medicine, University of Birmingham) discussed influences affecting human prenatal growth. It seemed that up to 27 weeks fœtal weight was independent of the number of fœtuses in the uterus, but after that the growth-rate of twins fell below that of singletons. Growth began to be retarded when the weight of the fœtus or fœtuses was about 7 lb., and in singletons from the thirty-sixth week to birth retardation clearly occurred. Whether this maternal effect was due to local uterine factors or to systemic ones was not surely known, nor whether the degree of retardation suffered by the fœtus had any effect in later life. Prof. McKeown thought that the retardation period, that is the last four weeks before birth, was a period of considerable growth difficulty in man, and felt that increased attention should be paid to it, both prophylactically and therapeutically.

Dr. A. W. Boyne (Rowett Research Institute, Aberdeen) discussed some aspects of the well-known secular trend to higher weight and height of children at all ages. He quoted French and Scandanavian data, as well as British, which left no doubt that an increase in final adult height had been occurring as well as an earlier achievement of adolescence and full stature. Some evidence pointed to this increase in adult stature having been greater in the lower socio-economic groups than in those who had always been well fed and well housed. Dr. Boyne discussed the changes in 11-year-old intelligence quotient in some Scottish data, and in particular the increase of girls' intelligence quotient relative to boys' at this age. He suggested this might have the same explanation as a similar increase in sex difference in weight, which was certainly due to the earlier occurrence of the adolescent growth spurt. Though his premise demanded the existence of a growth spurt in intelligence quotient at adolescence, the consensus of opinion was against any such view.

Each of the papers was followed by a lively discussion. These discussions ranged over the manner of man's evolution by differential growth-rates of brain and other parts, the adaptation of different races to different habitats by differential patterns of growth, the occurrence of homeorrhesis in man and the greater stability of growth of the female under stress than that of the hemizygous male, and the relation of growth of the body to the development of mental skills.

A whole day's meeting to discuss human growth would have been unthinkable in Britain even ten years ago, and the Society for the Study of Human Biology is much to be congratulated for furthering the development of this important subject.

J. M. TANNER

THE ROCKEFELLER FOUNDATION

THE President's review, reprinted from the Annual Report, 1958, of the Rockefeller Foundation together with Dr. Warren Weaver's report, "A Quarter Century in the Natural Sciences", records appropriations by the Foundation during the year totalling 31,592,157 dollars, of which 6,274,205 dollars were for agriculture, 6,201,225 dollars for biological and medical research, 4,239,160 dollars for medical education and public health, 4,300,160 dollars for the social sciences, 3,620,582 dollars for the humanities, and 3,266,575 dollars for supporting services. The total included funds for 279 Rockefeller Foundation Fellowships in fifty-one countries for advanced study outside the recipient's own country, and 301 other Fellows continued their work in 1958 through earlier awards. Dean Rusk's general comments are appropriate to the increasing interest in economic and technical assistance to the underdeveloped countries. The expansion of such development programmes has compelled the Rockefeller Foundation to consider carefully where it can make its best contribution, and Dean Rusk maintains that the Foundation's own experience emphasizes the dependance of significant social and economic advance upon trained leadership and the severe limitation of large development programmes by the lack of qualified people. The need for professional competence is likely to be far greater than official development plans usually contemplated, and accordingly the Foundation's most significant contribution is likely to be in the preparation of competent men and women for roles of leadership and, so far as the underdeveloped countries are concerned, in the effective application of existing knowledge to their practical needs, with an emphasis upon fundamental research.

Dean Rusk points out that the 1958 awards bring the total of Foundation fellowships to 8,117, and that scholarships, training grants and other more directly administered training aids may be used where the more formal fellowships would not be appropriate. Grants are also made to permit other organizations to award fellowships and training grants in their special field and to permit other agencies to award fellowships within the recipient's own country. Travel grants totalling about 250 were made in 1958 to permit visits highly relevant to the recipient's plans and professional advancement; financial assistance was also given to key institutions, such as the Paulista School of Medicine in São Paulo, Brazil, which can assume roles of national and regional significance in developing leadership, as well as assistance to libraries, both in books and in the improvement of library techniques, and training within the Foundation's own operating programmes in agriculture and virus research. Among grants in 1958 in support of research highly relevant to development programmes, the President selects for mention those to Cornell University for research on crop yields, to Kyoto University for research on wheat, to the University of Alaska for studies of grasses and legumes, and to the National Research Council for research on foods rich in protein, while he emphasizes that the Foundation's most direct contribution to inter-cultural understanding takes the form of assistance to relevant university work in the humanities and social sciences. He also stresses the Foundation's consistent policy of supporting pioneering work along the growing edges of knowledge and its general policy not to accept responsibility for physical plant. The Foundation also tends now to a policy of broad longer-term support of research projects, although it can do so in only a few selected cases, believing that this is a responsible adjustment to current changes and the need for stabilization and that it leaves decisions about specific research to those most closely concerned. Although in the period 1953–58 just under 65 per cent of the Foundation's expenditure or commitments of 637 million dollars was for institutions, organizations, scientists and scholars in the United States, these funds have often strengthened American institutions from which it has drawn its own staff and in which its Fellows might be trained for increased responsibility. Finally, it is noted that the Foundation continues to draw upon its capital funds to the extent of 5 million dollars a year to do more in Latin America, Africa, the Middle East and Asia than would be possible within its annual income, in view of the crucial importance of these present years for the peoples of these areas.

Dr. Weaver's brilliant survey, which occupies some 115 pages compared with the President's 25, is intended to gave a general account of the state of scientific advance in 1932 as a background to the explanation of the reasons which led the Foundation in 1933 to place major emphasis in its support of science on studies of living things. The bulk of the Report is a summary of the Foundation's subsequent activities under its Programme in Experimental Biology—a survey which covers advances in techniques and instruments as well as in our knowledge of the behaviour and structure of living things. Finally, glancing at the future, Dr. Weaver gives reasons for his belief that we are on the threshold of what should be a new era in biology.

INTERNATIONAL CONTROL OF NARCOTIC DRUGS

SINCE the first international conference on the control of narcotics, which met in 1909 in Shanghai, there has been universal recognition of the importance of preventing the abuse of narcotic drugs. Before the Second World War, the League of Nations undertook the necessary measures for international control of illicit traffic in opium, morphine and other drugs used by addicts. Through its Health Committee, the League also dealt with the medical problems involved in such control. When the League of Nations was dissolved its functions were conferred upon two international organizations: the policy-making and administrative functions were transferred to the United Nations Organization and the specifically medical aspects came within the purview of the World Health Organization.

The World Health Organization advises on the medical aspects of drug addiction and addiction-producing drugs. It is empowered to decide whether a newly discovered product is liable to produce addiction and should therefore be subject to international control. The Organization takes such decisions on the advice of an Expert Committee on the Addiction-Producing Drugs, the activities of which include the examination of drugs suspected of having addiction-producing properties. Since its inception, that is, during the past ten years, the Committee has examined 73 drugs and preparations, 55 of which were found to represent a danger to public health. The proceedings of the Committee, accompanied by statements on special problems raised by drug addiction, have been published in nine reports. It also advises on products which, although not addiction-producing drugs, can readily be converted into them. The same Committee has also given definitions of 'drug addiction' and 'drug habituation', taking into account pharmacological, psychological and public health aspects. These definitions have found world-wide acceptance. Recently, the range of drugs which need continual survey has been increased by the inclusion of hypnotic and tranquillizing, as well as stimulating, agents, although these do not lead to addiction in the strict sense of the definition.

The World Health Organization has also started to take an active interest in the treatment of drug addicts. In 1956 a Study Group on the Treatment and Care of Drug Addicts examined the medical features of drug addiction caused by opium, opiates, morphine-like synthetic drugs and cannabis, and outlined general principles as well as recommending rational methods of treatment and rehabilitation.

The chewing of coca leaves, which is so widespread in many parts of Latin America, and the increasing abuse of *Cannabis* are other important problems dealt with by the World Health Organization, which has decided that both habits represent a considerable danger to public health, and it has suggested the form which international control of these types of addiction should take.

The problem is complicated by the introduction of new therapeutic substances which may have addiction-producing properties and, above all, the continual discovery of new narcotics, mainly synthetic, which are submitted for international control every year. The World Health Organization follows developments very closely and, at the request of the Economic and

R 320

Social Council, has undertaken studies on the chemical structure of synthetic substances with morphine-like effects, the relationship between their chemical structure and their analgesic action, and the relationship between the latter and their liability to produce addiction. The Organization has studied the therapeutic properties and side effects—especially the addiction-producing properties—of 30 drugs of practical importance which have been put on the market as substitutes for morphine and codeine*.

MARRIAGE-RATE OF AMERICAN COLLEGE GRADUATES

COLLEGE graduates in the United States are now marrying at a much earlier age than their parents. They are having children much sooner, having more children, spacing them much closer together, and seem to be following the general trend of the younger generation by completing their families earlier than their parents.

During 1946–1956, the College Study Group of the Population Reference Bureau, Inc., reported that the fertility of the younger college graduates was higher than that of the graduates of a generation ago (*Population Bulletin*, Vol. 15, No. 6: Fertility of College Graduates, Pp. 101–116 (Washington, D.C.: Population Reference Bureau, Inc., 1959.) 50 cents). Additional results, gathered in 1955, have made it possible to measure the degree of these marriage and fertility differences in two college classes, those graduating in 1930 and in 1945. The average age at first marriage in 1955 in the United States was 23 for men and 20 for women. For the graduate class of 1945, the average age at marriage was 24 years for both sexes and it was 25 years for both sexes for the class of 1930. Ten years after graduation, fewer of the younger graduates remained single: 13 per cent of the men and 10 per cent of the women among the younger graduates, compared with 20 per cent of the men and 27 per cent of the women among the older graduates.

The proportion not married ten years after graduation continued to be higher among graduates of Roman Catholic colleges: 20 per cent of the men and 23 per cent of the women in the class of 1945, compared with 38 per cent of the men and 43 per cent of the women in the class of 1930.

When the survey was taken in 1955, the 10-year women graduates of the class of 1945 who were about mid-way through their family-building years already had a greater average number of children than the 25-year women of the class of 1930, who had reached the end of the reproductive span. The men of both classes were parents of still more children than the women in both groups. Although the younger graduates had babies at a faster rate than the older graduates, their contribution to the post-war rise in the birth-rate was not as great as either high school or grade school graduates. The differential birth-rate which has concerned eugenicists and others still persists. The 10-year women college graduates did not reach their fertility peak until 1952. Once they started having babies, they continued to have them over a longer period of time than other women of their age. These results confirm the belief that a great change in attitudes towards marriage and family has occurred in the United States, even among college graduates.

PLANT POPULATION AND CROP YIELD

By R. HOLLIDAY

Department of Agriculture, University of Leeds

GRAPHICAL examination of the relation between crop yield and the number of plants per unit area suggests that two distinct types of curve may be obtained. One, typified by work by Engledow[1] and Hudson[2] on grain yield in wheat, is approximately parabolic in shape. With this type of curve a certain plant population gives a maximum yield, while greater or less populations give lower yields. Other workers have obtained similar curves in the case of seed, fruit or inflorescence yield with other cereals, maize, sorghum, soya beans, peas, tomatoes, hops and both seed and lint yield in cotton.

Work at Leeds with wheat has given, in the case of straw yield, an increasing yield relation to a maximum but with no sign of yield decrease beyond this maximum up to populations established from 4 cwt. of seed per acre. This relation is referred to below as an asymptotic curve. In contrast, the yield of grain in most years showed a maximum at or about populations established from 1 cwt. of seed per acre. A similar contrast in dry matter yield–plant population curves was obtained with pure sowings of perennial ryegrass[3,4]. In the seeding year, with yield resulting from vegetative growth, the curve was asymptotic up to populations established from 160 lb./acre; in the following year, where yield was a product of reproductive as well as vegetative growth, the curve showed a maximum at or about populations established from 20 lb. of seed per acre. Donald[5] in Australia obtained the same kind of contrast with Wimmera ryegrass and subterranean clover; the seed–yield curve showed a maximum, while the vegetative yield was asymptotic up to populations of 180×10^6 plants per acre in the case of ryegrass experiments.

Although the range of populations covered are sometimes rather limited, references in the literature would suggest that sugar beet, kale, mangolds, fodder beet, tea and timber yields, all of which are products of vegetative growth, show an asymptotic type of yield–plant population relation.

Table 1

Seed rate lb./acre	Plant population at harvest (000's /acre(x))	D.M. yield (tons/acre (Ya))	D.M. yield per plant (tons $\times 10^{-6}$ (Yp))	Reciprocal of yield per plant ($1/Yp$)

Several years of work have been carried out at Leeds on the rape crop with populations up to 3×10^{6} plants per acre, with marrow-stemmed and thousand-head kale up to $0·5 \times 10^{6}$ plants per acre and with potatoes up to $3·2 \times 10^{4}$ plants per acre. With each of these crops the dry matter yield has shown an asymptotic relation to populations. In the case of potatoes, this has applied to both top growth and total yield of tuber expressed on either a fresh or dry matter yield basis. The yield of ware-sized tubers, however, gave a curve with an observable maximum in it.

The evidence given above suggests that the parabolic type yield–plant population relation is typical where yield is some product of reproductive growth, while the asymptotic one is more characteristic where yield is a product of vegetative growth. Attempts have been made to analyse the form of the latter type of curve using the four crops mentioned above. Data from four-year experiments with the rape crop (Essex Giant rape) is given in Table 1. In 1951 and 1952 the crop was sown in late July and harvested in October as a 'catch' crop. In 1953 and 1954 it was treated as a full season crop, being sown in April and harvested in October. In the last two years three levels of nitrogenous fertilizer were included as a treatment factor, but as there was no significant interaction between the two factors, the figures given in Table 1 are the main effects of the population treatment. It should be mentioned that in each of the years covered by these experiments soil moisture was not severely limiting, and the same can be said of Donald's work in Australia.

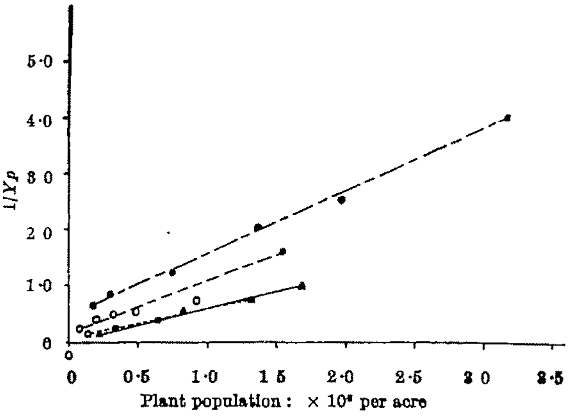

Fig. 1. Variation of $1/Yp$ with plant population (Essex Giant rape). ○, 1951; ●, 1952; ▲, 1953; ⊟, 1954

As yield per unit area (Ya) is a product of the number of plants per unit area (x) and the yield per plant (Yp), an examination of Ya starts logically with a study of Yp. The size of Yp decreases at a diminishing rate with increasing number of plants per unit area. Fig. 1 shows that Yp decreases in such a way that its reciprocal ($1/Yp$) forms a linear relation to plant population (x). Studies with potatoes, marrow-stemmed and thousand-head kale have shown the same feature:

Thus:

$$\frac{1}{Yp} = a + bx$$

Hence
$$Yp = \frac{1}{a + bx} \tag{1}$$

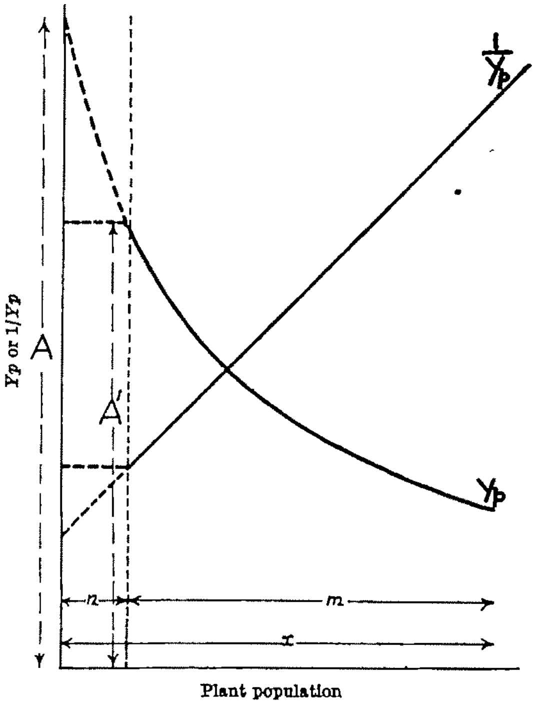
where
$$x = 0\,;\; Yp = \frac{1}{a}$$

Yp at $x = 0$ represents a theoretical situation where there is a complete absence of competition for environmental resources. Thus Yp should be at its maximum possible value. Let this 'apparent' maximum yield of Yp be represented by A and substitute this value for $1/a$ in equation (1), that is:

$$Yp = A \times \frac{1}{1 + Abx} \tag{2}$$

As yield per unit area is the product of yield per plant and the number of plants:

$$Ya = Yp \times x = Ax \times \frac{1}{1 + Abx} \tag{3}$$



Plant population

Fig. 2

Equation (3) describes the form of the asymptotic yield–plant population curve. In it the value A has been termed the 'apparent' maximum yield attainable by the isolated individual plant in the particular environment, because it was obtained by extrapolating the $1/Yp$ regression line to the ordinate. As such, A will be greater than the true maximum yield A'. The latter will apply up to some plant population n, at which plant competition for environment resources just commences. The reduction of yield per plant will thus operate over the remaining plant population $m = (x - n)$ (Fig. 2). The response curve formula may now be re-stated in terms of the true maximum yield per plant A':

$$Ya = (A'n + A'm)\,\frac{1}{1 + A'bm} \qquad (4)$$

or

$$Ya = A'x \,.\, \frac{1}{1 + A'bm}$$

Equation (4) is fundamentally more satisfactory than equation (3). Since n and m are terms which would change with increases in the size of A' through the growing season and hence will be difficult to determine experimentally, equation (3) will probably be of greater utility. This will also mean that the change of slope in the Yp or $1/Yp$ curve in Fig. 2 will be more gradual than is shown. It can be shown, however, that:

$$\frac{A - A'}{AA'} = b\,(x - m) = bn \qquad (5)$$

Thus, n may be determined if in any plant population experiment a treatment is included where plants are grown completely free from competition so that A' may be determined experimentally.

The value $1/(1 + Abx)$ in the simpler or $1/(1 + A'bm)$ in the more complex equation may be appropriately termed the 'competition function', since it shows the way in which Yp decreases with increasing competition for the finite environment resources available per unit area.

It is considered that the equations established above will have several uses in agronomic work. Inter-plant competition within a growing crop represents a relatively simple ecological situation. The treatment given above may, nevertheless, represent a first stage towards studying more complex situations where two or more species are in competition for environment resources.

Acknowledgment is made to Dr. B. L. Welch, reader in statistics, University of Leeds, for help and advice in the latter part of this article.

THE RESPIRATORY DEAD SPACE OF THE GIRAFFE

By PROF. EUGENE D. ROBIN*, DR. JOSEPH M. CORSON and
PROF. GUSTAVE J. DAMMIN

THE physiologist has always been fascinated by the problems inherent in the regulation of circulation and respiration of the giraffe, in which the brain and thorax are so widely separated.

One area of interest to physiologists is the respiratory dead space. The respiratory dead space is composed of all portions of the respiratory tract which are ventilated but do not participate in gas exchange with pulmonary capillary blood. For obvious anatomical reasons, the giraffe is required to ventilate a relatively large dead space. The problem of a large dead space is not unique to the giraffe. Human subjects with severe obstructive emphysema likewise have the problem of ventilating a large respiratory dead space. Unlike the giraffe, the increased dead space of emphysema is not a single anatomical entity. Rather, it consists of those portions of the lung which are relatively poorly perfused with blood for the amount of ventilation they receive.

Recently, the formalin-fixed trachea and lungs of a giraffe became available to us for study. It seemed of interest to make pertinent measurements of the volume of these organs to gain some insight into the mechanisms by which the giraffe solves the problem of a large respiratory dead space. Comparisons could be made with similar measurements in normal humans and patients with emphysema.

(*a*) *Case-history* (*Hi Hat*). The subject was a post-partum giraffe, gravida 1, para 1, which, until death, had lived at the Royal Oak Zoo. She had given birth to a giraffe, but shortly after birth the youngster died. Following the death of her calf, the subject became depressed and anorectic. Three weeks after the calf's death the subject died. (The general consensus of opinion was that *Hi Hat* died of a broken heart; gross and microscopic examination failed to confirm this.)

(*b*) *Dead space volume*. The tracheal volume of the giraffe was estimated by assuming the trachea was a cylinder. The total length and the mean radius were obtained by direct measurements. The volume was calculated by means of the standard formula for the volume of a cylinder, namely, $V = \pi r^2 l$, where V is tracheal volume in ml., r is mean radius in cm., and l is length in cm.

Because the total anatomical dead space includes not only the trachea but also the pharynx, bronchi and bronchioles, the volume obtained in this manner undoubtedly under-estimates the true respiratory dead space of the giraffe. However, the major component of giraffe dead space is made up of trachea, and this volume may be accepted as an approximation to the actual volume of dead space.

(*c*) *Total lung capacity*. The total lung capacity was estimated as follows. The specific gravity of lung tissue throughout the mammalian kingdom appears to be essentially the same. For this reason,

Table 1. A COMPARISON OF DEAD SPACE VOLUMES; LUNG WEIGHTS; TOTAL LUNG CAPACITIES; AND THE RATIO OF DEAD SPACE/TOTAL LUNG CAPACITY IN A GIRAFFE, A COW, A NORMAL HUMAN, AND A PATIENT WITH OBSTRUCTIVE EMPHYSEMA

	Dead space vol. ml. BTPS	Formalin-fixed weight of lung (gm.)	Total lung capacity L.	Ratio of dead space to total lung capacity
Giraffe	1,600*	6,260	47	0·34
Cow	380†	2,760	21	0·18
Normal adult human	175	800	6	0·29
Patient with obstructive emphysema	350‡		10	0·35

* Tracheal dead space only.

† Marked under-estimate of total dead space since this figure does not include pharyngeal dead space.

‡ Physiological and not anatomical dead space.

a ratio of lung weights is therefore equal to a ratio of lung volumes (assuming no major differences in the elastic properties of the lung).

Adult human lungs were obtained at post-mortem examination. They were fixed in formalin and then weighed. The ratio of the weight of formalin-fixed giraffe lung to the weight of formalin-fixed normal human lung was then obtained. Six litres is an acceptable value of total lung capacity in the normal adult human. By the use of a simple formula, the total lung capacity of the giraffe could be estimated:

$$\text{Total lung capacity of giraffe (litres)} = \frac{\text{Weight of giraffe lung}}{\text{Weight of human lung}} \times 6$$

(*d*) *Subjects for comparison.* Because of the greater mass of the giraffe as compared with man, it is difficult to make direct comparisons of the relative magnitude of dead space to total lung capacity in the two species. For this reason, it seemed important to make similar measurements on the trachea and total lung capacity of the cow. (From the point of view of comparative physiology, a cow may be regarded as a giraffe with a short neck.) The trachea and lungs of a cow were obtained and processed in the same manner that the organs of the giraffe had been.

Values were obtained from a normal human male at post-mortem; and by direct measurement using standard methods[1] in a patient with severe obstructive emphysema.

(*e*) *Gross and histological studies.* Gross examination and dissection were carried out in the usual fashion. Sections were taken from the hilar area and peripheral portions of each lobe. These sections were stained with hæmatoxylin and eosin, and with the Verhoeff–Van Gieson elastic tissue stain.

The results relevant to dead space volume, lung weights and total lung capacity are shown in Table 1. The volume of the dead space in the giraffe is 1,600 ml. This value is approximately nine times greater than the corresponding figure in normal man and approximately 4·5 times greater than the corresponding figure in the subject with obstructive emphysema.

The large dead space in the giraffe is balanced to some extent by the increase in total lung capacity, which is approximately eight times as large as the corresponding figure in normal man. The large total lung capacity of the giraffe does not appear to be simply a function of the size of the giraffe, since the total lung capacity of the giraffe is more than twice that of the cow, an animal which is roughly comparable in its size and organization.

Gross examination of the lungs of the giraffe in this study revealed no significant parenchymal, bronchial or vascular lesions. Microscopically, the alveolar structure of giraffe lung resembled that seen in normal human lung, except that the alveolar walls were thicker and the elastic fibres coarser. There were small foci of fibrosis, some with infiltration of mononuclear cells. Some of the bronchioles contained clusters of mononuclear cells, suggesting a recent inflammatory process. There was no obliteration of pulmonary vascular bed, nor was there obvious alteration in the individual pulmonary vessels. As compared with normal human lung, elastic tissue seemed to be increased in amount. This increase was most conspicuous in the pleura and in the submucosa of bronchi (see Figs. 1*a* and 1*b*). In the pleura, the elastic fibres were closely intermeshed in a thick, carpet-like fashion. For comparison, the microscopic appearance of lung from a patient dying with advanced obstructive emphysema is shown in Fig. 2 (*PBBH A*56-232). The pattern of elastic fibres here shows less density than that seen in the pleura of the normal human lung, in addition to a reduction of elastic fibres in the alveolar walls.

The giraffe apparently uses at least two mechanisms for the maintenance of adequate alveolar ventilation. One mechanism relates to the rate of ventilation. Observations of giraffes while standing quietly reveal

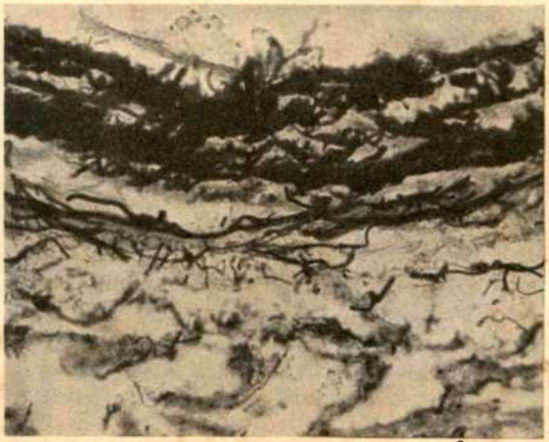

Fig. 1*a*. Giraffe lung with pleura and adjacent alveoli. The upper half of the field is occupied by the pleura with its dense meshwork of coarse elastic fibres (elastic tissue stain; × 230)

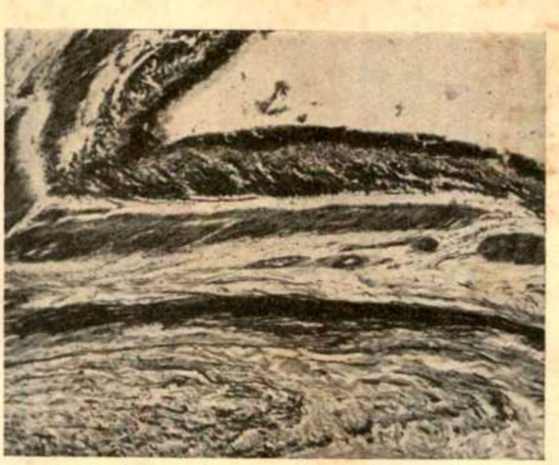

Fig. 1*b*. Giraffe lung. Bronchus with abundance of elastic fibres in the submucosa and deeper in the wall (elastic fibre stain; × 65).

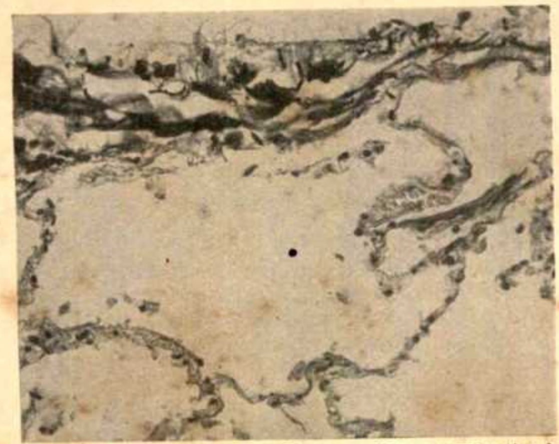

Fig. 2. Human lung with emphysema. Note magnification is same as in Fig. 1*a*. The pleura, at top of field, has elastic fibres in an attenuated pattern, and the adjacent alveolus is abnormally dilated (elastic tissue stain ; × 230)

that the average respiratory rate is 8–10 breaths per min. (personal and unpublished observation of E. D. R. made at the Bronx Zoo). For a given minute–volume, a slow respiratory-rate tends to increase alveolar ventilation, since it reduces the number of times per min. the dead space must be filled with air[2]. The second mechanism relates to the large lung capacity of this animal. It would seem that even considering its mass, the total lung capacity of the giraffe is disproportionately large. In these circumstances, the ventilation of a large dead space could easily be attained.

However, it should be emphasized that a large total lung capacity is not, by itself, adequate to ensure an effective volume of ventilation. The patient with obstructive emphysema may have an increased total lung capacity and still suffer from severe pulmonary insufficiency. The increase in total lung capacity in emphysema is chiefly brought about by an increase in the residual volume of the lung. This increase cannot be used to provide additional ventilation as needed. The increase in the total lung capacity of the giraffe is presumably an increase in inspiratory and expiratory capacity, and thus can serve to supply additional volumes of ventilation as needed.

This fact may be documented in another way. For the purpose of adequate ventilation, the lung volumes must not only be adequate in amount, but also the lung tissue must be functionally and structurally sound. The histological appearance of giraffe lung as shown in Fig. 1*a* shows an apparently normal, but by comparison with man, a very thick pleura with an abundance of heavy elastic fibres. Fig. 1*b* shows not only a heavy meshwork of elastic fibres in the deeper portion of the bronchial wall, but also a similar abundance of elastic fibres in the submucosa. Such a lung would seem to be admirably suited for the extra work that might be required to ventilate a large dead space. In the emphysematous patient (see Fig. 2), the elastic fibre pattern is attenuated and lacking in continuity.

The adequate size of the giraffe lung may also be illustrated by considering the ratio between total lung capacity and tidal volume in the two species. Patterson and Warren[3] have reported that the resting tidal volume of the giraffe is approximately 4 litres/breath. Normal man has a resting tidal volume of approximately 0·6 litre. Therefore, both men and giraffes use approximately one-tenth to one-twelfth of their total lung capacity under basal conditions for the maintenance of adequate ventilation.

We are grateful to the Director of the Royal Oak Zoo, Royal Oak, Michigan, for making the trachea and lungs of *Hi Hat* available for study, and for supplying the details of the clinical history.

This investigation was supported in part by research grants (*H*-2243, *H*-1771) from the National Heart Institute of the National Institutes of Health, Public Health Service, and in part from the Massachusetts Heart Association.

PROTON MAGNETIC RESONANCE IN A SERIES OF DIMETHYL SILOXANE POLYMERS. A SPECIFIC LONG-CHAIN EFFECT?

By DR. J. G. POWLES and A. HARTLAND

Physics Department, Queen Mary College (University of London), Mile End Road, London, E.1

WE have measured the proton magnetic resonance effects in a series of dimethyl siloxane polymers $\{(CH_3)_3SiO[(CH_3)_2SiO]_nSi(CH_3)_3\}$ of various molecular weights, and these results will be discussed in greater detail elsewhere[1]. We feel that the results are of sufficient interest to justify a brief preliminary report, and we shall refer mainly to the measurements on one polymer, a silicone grease (Midland Silicones, *MS* 200, viscosity 10^6 centistokes at 25° C., $n \simeq 2{,}200$).

We have measured the longitudinal and transverse decay of proton magnetization by transient methods[2,3] using equipment described elsewhere[4]. The resonant frequency, ν_r, was 21·5 Mc./s. The longitudinal decay was always exponential within experimental error, and so we give in Fig. 1 the decay constant, T_1. The transverse decay was exponential in the temperature-range below approximately $-42°$ C. (but see below) and is represented by a decay constant, T_2, in Fig. 1. Above $-42°$ C. the decay of transverse magnetization was non-exponential, but it was found it could be represented by a decay of the form $h = h_1 \exp. (-t/T_{21}) + h_2 \exp(-t/T_{22})$ with the values of T_{21}, T_{22} and $h_1/(h_1 + h_2)$ as shown in the graph. In presenting the results in this way, we do not wish to imply necessarily that there are two distinct proton signals.

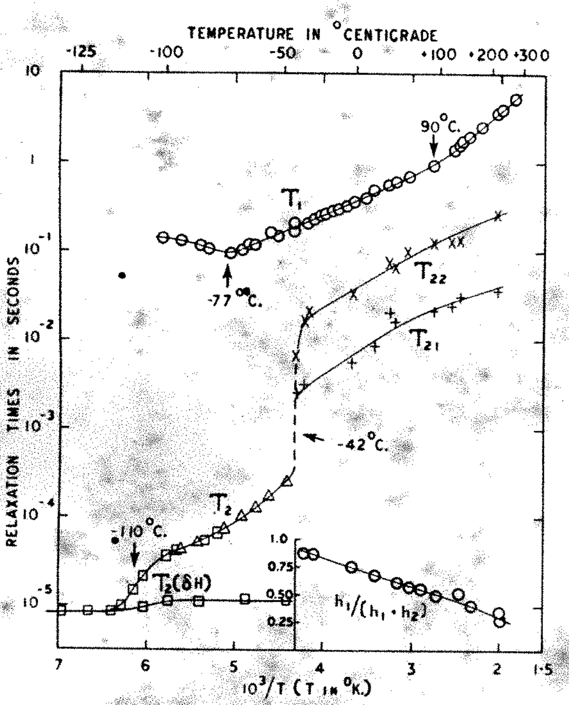

Fig. 1. Proton magnetic resonance relaxation times as a function of temperature for a dimethyl siloxane polymer grease characterized by a viscosity of 10^6 centistokes at 25° C.

The measurements of broad lines were made by Mr. J. A. E. Kail by conventional methods using apparatus which has been described elsewhere[5] and afterwards improved. We give in Fig. 1 the T_2 values for the grease indicated as $T_2(\delta H)$ obtained from the line-width, δH, by the formula $T_2 = \frac{2}{\sqrt{3}}\,\gamma\delta H$. The measurements of broad lines show interesting features, including evidence of crystallinity (approximately 90 per cent at − 90° C.) and of methyl group reorientation even at very low temperatures, and they will be discussed in detail elsewhere[1]. They are similar in outline to those reported for a dimethyl siloxane rubber[6]. It is probable, therefore, that the transient measurements below − 42° C. have failed to reveal the signal from the crystalline phase.

A rather shallow minimum of T_1 of 9×10^{-2} sec. is observed at − 77° C., and on general grounds[7] it is reasonable to deduce that the relevant correlation frequency, ν_c, for motion of the protons is given approximately by $\nu_c = \sqrt{2}.\nu_r = 3 \times 10^7$ c./s. at this temperature. However, we note that the ratio T_1/T_2 at the minimum of T_1 is 1,300, whereas according to theory[7,8], it should be approximately 2. This is an even larger discrepancy than was found in poly*iso*butylene[9], where $(T_1/T_2)_{\min T_1}$ was 100 and contrasts with the theoretical value being found in materials containing smaller molecules[10,11]. This large ratio may be explained as due to a distribution of correlation frequencies or by the effect of multiple interactions which may affect T_1 and T_2 differently at the same temperature. If it is assumed to be due to a distribution of correlation frequencies of uniform intensity on a logarithmic scale in the range ν_G/b to $b\nu_G$[10], then $\nu_G = 3 \times 10^7$ c./s. and b = 1,300, which is a rather wide and unlikely distribution. The actual value of $T_{1\,\min}$ and the variation of T_1 with temperature will be discussed elsewhere[1].

Some motional information can also be obtained from the variation of T_2 near its 'rigid lattice' value using a formula of the type[7] $(T_{2r}/T_2)^2 = \frac{2}{\pi}\tan^{-1}(1/\sqrt{3}\,.\,\pi\nu_c T_2)$, and so we deduce that ν_c (or possibly ν_G) is of the order 3×10^4 c./s. at about − 110° C., both for the amorphous and crystalline regions. The behaviour is evidently complex.

It would now be of interest to compare these values with the values of correlation frequency for dielectric loss (motion of the SiO bonds). The only measurements available to us which might be relevant[12] are not on exactly the same material, but on a silicone grease designated *MS*4 (a dimethyl siloxane polymer of viscosity 500 cs. containing 12 per cent 'Aerosil' and traces of boron compounds; the latter should not affect the results appreciably), in which the dielectric correlation frequency is 4×10^3 c./s. at − 110° C. The agreement with the frequencies predicted from nuclear resonance is not impressive, but the behaviour with temperature is similar. Measurements on the identical material are desirable. We note in passing that the dielectric measurements show only a small distribution of correlation frequencies, if any (Reddish, W., private communication), so that it is unlikely that a broad continuous distribution exists at the higher temperature for the principal motion and so this explanation of $(T_1/T_2)_{\min T_1}$ is less favoured than a multiple interaction explanation if the dielectric results are relevant.

Further information in this region is obtainable from measurement of shear stress relaxation. The only data we have been able to find is on a dimethyl siloxane rubber (polymer cross-linked with 2·5 per cent dibenzylperoxide, no filler) which shows a peak at − 110° C. for a few tens of cycles per sec. (Wolf, K., private communication). The meaning of this measurement may be obscured by crystallization processes occurring as the temperature varied. Another change in mechanical properties near − 42° C. is evidently related to the 'melting' and is not directly a relaxation effect. The interpretation of the measurements in this temperature-range is complicated by the occurrence of the two phases[1].

At a temperature in the region of − 42° C. the character of the transverse decay changes dramatically, but there is no effect at all discernible on T_1. The change-over occurs within a few degrees and is more reminiscent of a first-order phase-change than the behaviour near a glass transition. The change, therefore, corresponds closely to the melting point in materials of low molecular weight[1,12]. It seems likely that crystallization sets in at this temperature but not above (Holmes, D. R., private communication). The transverse decay is not far from exponential just above − 42° C. and is again not far from exponential at the highest temperature (270° C.), with a uniform change-over from the shorter to the longer T_2 value. Even so, T_2 is very much less than T_1 at the highest temperature attained, and there is no sign they are approaching in value, as expected from theory[7,8], and which is, in fact, observed in the lower molecular weight polymers[1], so that a slow interaction still exists. We were unable to get to higher temperatures owing to decomposition of the material. We have also measured the shapes of lines directly, around the transition region, with similar results (we are grateful to Mr. D. J. Neale for making these measurements). Dielectric loss measurements on rather lower molecular weight polymers with n = 0–365 (ref. 13) in the temperature-range + 150° C. to − 35° C. show a loss peak at $2 \cdot 5 \times 10^{10}$ c./s. which is reported to be independent of temperature and molecular weight. This presumably means that, for the present grease, the absorption is in the region of 10^{10} c./s. and varies only slowly with temperature. Evidently more dielectric measurements are desirable, particularly in the region of the transition temperature. Some preliminary measurements of shear stress relaxation at 30° C. (ref. 14) also suggest a ν_c of order 10^{11} c./s. in this temperature region, and in addition a much lower frequency process. The possibility of two processes, one with $\nu_c \gg \nu_r$ and one with $\nu_c < \nu_r$ at 30° C., is in accord with the interpretation of the nuclear resonance measurements given below.

Non-exponential decay of transverse magnetization has been observed also in poly*iso*butylene[9] and in polyethylene[15] under similar conditions. It has been suggested[15] that the two T_2's in polyethylene correspond to two signals from protons in different 'phases'. We find this difficult to understand, particularly in poly*iso*butylene and in silicone polymers at these temperatures. The silicone grease shows no evidence of crystallinity above − 42° C. (Holmes, D. R., private communication), and poly*iso*butylene only crystallizes on stretching. The probability of two distinct phases at higher temperatures, even in polyethylenes, seems rather small. Moreover, we have been unable to find multiple T_1's in this region as expected for more than one phase, although it must be admitted that T_1 values are less sensitive than T_2 values and so multiplicity may not have been resolved. Further, we have found transverse decay requiring to be represented by at least three exponential terms in a dimethyl siloxane polymer gum together with an inexplicable dependence upon temperature[1]. For these reasons, we prefer to regard the absorption line above − 42° C. as a single line with structure, which arises because it is controlled by a weak but slow (that is, $\nu_c < \nu_r$) nuclear dipole interaction. This 'narrow broad' line is only observed when the principal interaction within the methyl groups and between nearby methyl groups has been substantially motionally averaged.

We suggest tentatively that the interaction in question is that between chains, as has already been suggested for poly*iso*butylene[9], and that it may be characteristic of long-chain compounds.

Our measurements (Fig. 2) suggest that the effect appears in dimethyl siloxane polymers of chain-length between approximately 700 and 1,700 atoms[1]. T_1 and T_2 at 25° C. as a function of viscosity at 25° C. are shown in Fig. 2 and there is clearly a change in character at a value of viscosity of about 3,000 cs., that is, a chain-length of about 1,000 atoms. This change is not explicable by viscosity change alone, since the same result is obtained over a wide temperature-range. A somewhat similar situation exists in the polyethylenes[15] in the temperature-range 120–200° C., where multiple T_2's appear at a molecular weight between 5,800 and 9,600, that is, for chain-lengths between 410 and 680 atoms. It is interesting to speculate whether the present results are connected with the viscosity anomaly at approximately 1,000 chain atoms which is observed in the dimethyl siloxane polymers[16] and which is thought to be connected with chain entanglement[17] (we are indebted to Dr. E. R. Howells for this suggestion). It is not known whether molten polyethylenes show a similar effect. However, it is not clear how chain entanglements, as such, explain the present results; they are at first sight more suitable to a 'two-phase' interpretation, though not with the observed relative intensities. The appearance of the nuclear resonance anomaly at a similar chain-length may be because the entanglements affect the motion of all parts of the chains. On the other hand, it may be that the parameters simply become favourable for it at about that chain-length. It will be of interest to search for a similar effect in other polymers in which the temperature can be raised sufficiently without degradation.

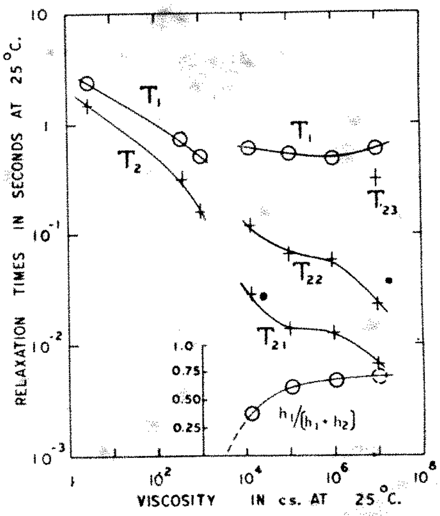

Fig. 2. Proton resonance relaxation times at 25° C. for a series of dimethyl siloxane polymers as a function of molecular weight which is characterized by the flow viscosity at 25° C. Note the abrupt change in character of T_2 in the region of 3,000 centistokes, which corresponds to a chain-length of approximately 1,000 atoms. T_1 also shows an anomaly

The marked change in slope of the T_1-temperature curve at + 90° C. corresponds to no discontinuity in the nature of the transverse relaxation, nor indeed have we been able to find any other physical quantity having an anomaly at this temperature.

We wish to thank Dr. E. R. Howells (Imperial Chemical Industries, Plastics Division) for many helpful discussions and for pointing out the possible relevance of chain entanglement. We also thank Dr. D. R. Holmes for making calorimetric and X-ray tests, Mr. W Reddish for supplying unpublished dielectric measurements, and Dr. K. Wolf (B.A.S.F., Ludwigshafen) for showing us some unpublished mechanical measurements.

LETTERS TO THE EDITORS

PHYSICS

Action of Graphite as a Lubricant

THE lubricating properties of graphite have considerable practical importance and scientific interest. The explanation often quoted for the mechanism is based on the assumption that the loosely bound graphite layers slide easily over each other like a pack of cards when graphite is used as a lubricant between moving surfaces[1]. In this communication we report briefly on experiments which indicate that a hitherto unconsidered mechanism might be important.

Samples of graphite were prepared for examination by electron microscopy by rubbing a grid on a block of graphite of reactor grade or by dusting peened powder or powder rubbed between glass plates on a grid. Photographs were taken using Philips *EM* 100 or Siemens Elmiskop I microscopes.

In every case, the picture showed a rolling up of sheets of graphite in regions thin enough to be observed by transmission. The sheets formed plain or spiralled rolls of external diameter of $0{\cdot}1$–1μ. Figs. 1 and 2 show typical pictures. On examination, the dark broad lines are seen to be foils which have peeled off from the rest; this is illustrated schematically in Fig. 3. Fig. 4 is a photograph of one roll. The structure of these rolls is similar to that of graphite whiskers[2], which are also composed of rolled-up sheets of layer planes. From our pictures, the thickness of the sheets may be estimated as of the order of 100 planes.

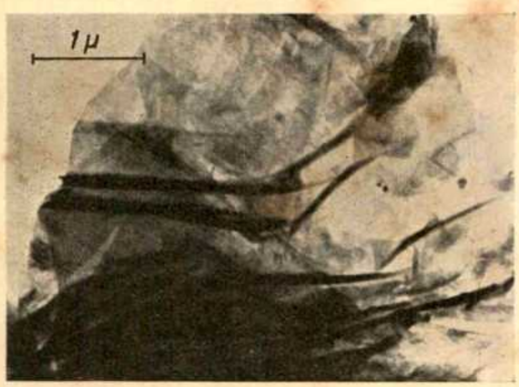

Fig. 1. Complex roller system. × 15,000

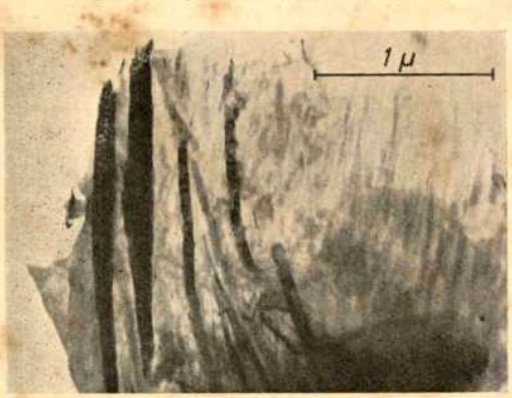

Fig. 2. Parallel rollers near edge of a crystal. × 24,000

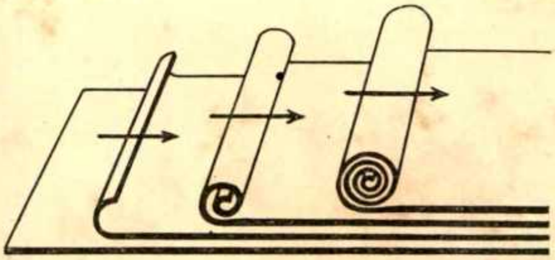

Fig. 3. Schematic illustration of rollers

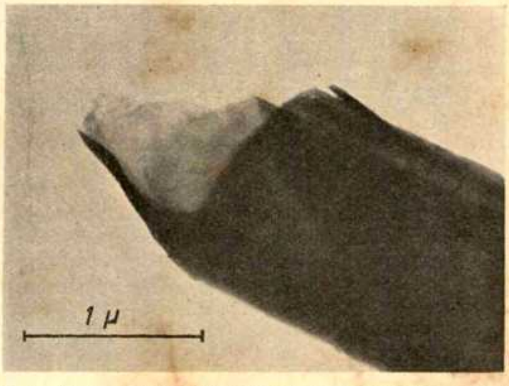

Fig. 4. Photograph showing structure of a large roller. × 24,000

We suggest that the lubricating properties of graphite are due essentially to the rolling up of packets of layers, which then act like roller bearings. Using a roller mechanism, it is possible to reconcile the experimental results of other workers[3], which indicate that: (*a*) a relatively high friction coefficient at room temperature is obtained if graphite is first outgassed at 800° C. *in vacuo*; (*b*) the vapour of water, or ammonia, acetone, etc., must be present for good lubrication at room temperature, whereas in a vacuum or in the presence of a very dry gas the friction coefficient is high and wear is rapid; (*c*) in dry helium at 600° C., wear is negligible.

Given the roller mechanism, the influence of water vapour at room temperature may be understood as a loosening of the interlayer binding forces, first at the edges of crystals and later inside them. (The friction coefficient decreases over a considerable period of time if water vapour is admitted to a previously outgassed sample *in vacuo*.) At high temperatures in dry atmospheres, temperature-loosening might be sufficient. Although Tsuzuku[4] has observed the sliding of graphite planes in small single crystals, it is difficult to imagine the lubrication of graphite in terms of layers slipping over each other for large flakes and polycrystalline arrays. The conventional idea of layer lattice crystals slipping by shear appears unlikely if compared with the roller mechanism in which the layers are pulled apart by breaking successive bonds between them. An explanation of the lubrication in terms of gliding planes would involve the movement of a series of dislocations which would be stopped at grain boundaries or run out at the pores; also such a mechanism would not be expected to show the observed sensitivity to the atmosphere, as dislocations usually tend to be locked by foreign atoms. The roller mechanism would be expected to hold for other layer lattice crystals—we have also observed rollers in molybdenum disulphide.

Effect of Cathode Surface Roughness and Oxidation on Arc Movement

AN arc established between two metal electrodes in the presence of a transverse magnetic field moves in a direction mutually perpendicular to the magnetic field lines and the axis of the arc current. At atmospheric pressure movement is in the Amperian direction but at low pressure it is in the opposite or retrograde sense.

Previous experiments[1,2] have shown that for both Amperian and retrograde motion the seat of arc movement is at the cathode or in the cathode fall region (provided that the cathode spot moves in a regular manner and not by a series of jumps) and therefore it is to be expected that cathode conditions would markedly affect the arc velocity. The effect of different materials has already been reported[1], but up to the present time there appears to be little conclusive evidence relating to the role of surface roughness or oxidation.

Recent experiments, however, have indicated that the degree of surface roughness and oxidation of the cathode influences the arc velocity in a well-defined and reproducible manner. The effect of roughness is illustrated in Fig. 1, which shows the arc velocity as a function of time from arc initiation for two cathodes of the same material but which had been subjected to different surface treatments. Two identical cup-shaped brass electrodes were polished mechanically and one was then etched, yielding a surface which was distinctly rougher than that of the electrode, which had been polished only. The electrodes were used in turn as cathodes with a brass anode in a low-pressure test cell, and opposed coils were arranged to produce a transverse magnetic field across the electrode gap. An arc was allowed to run on each cathode for three minutes in an atmosphere of nitrogen and the velocity was measured during this period. At the end of the time the appearance of the two cathode surfaces was identical. Whereas the initial arc velocities on the two electrodes were greatly different, the final values were almost identical, corresponding to the similarity in the final state of the two surfaces. The characteristic shape of the velocity–time curves is believed to be due to a progressive reduction of the oxide layer on each electrode by the nitrogen gas filling of the test cell.

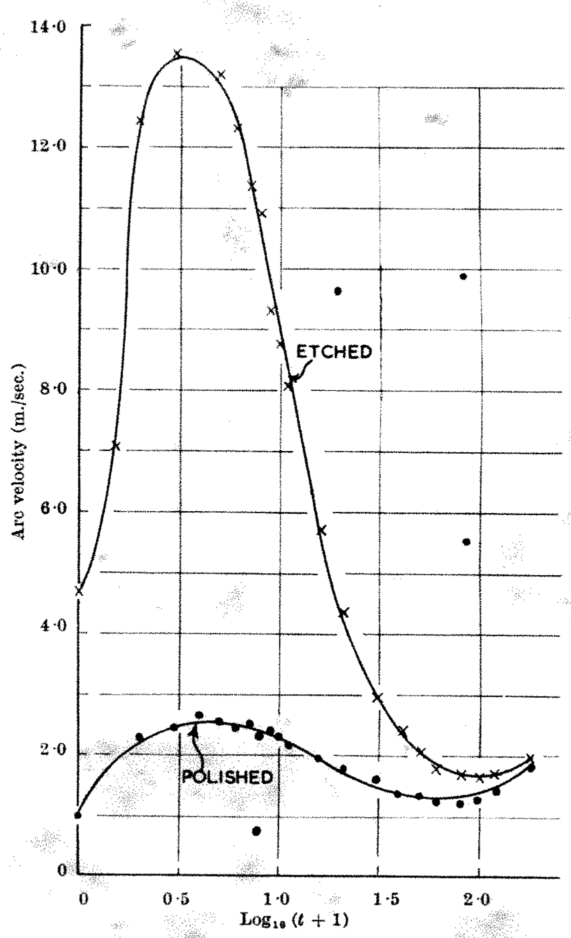

Fig. 1. Arc velocity on etched and non-etched electrodes as a function of time t seconds from arc initiation. Arc current 2·2 amp., magnetic flux density 0·015 Wb./m.^{2}, nitrogen pressure 25 mm. mercury. Inter-electrode gap 2·2 mm.

The effect of cathode oxidation is shown in Fig. 2. Polished cylindrical brass electrodes were etched and then allowed to oxidize in dry air for various times before mounting in a low-pressure test cell, parallel to a polished brass anode. An arc was initiated at one end of the electrode system and its movement along the electrodes under the influence of a transverse magnetic field recorded photographically. Before each arc run the breakdown voltage between the cathode and an auxiliary anode was measured at the Paschen minimum in order to give an indication of the effective work function of the cathode surface[3]. It is seen from Fig. 2 that for tests on electrodes oxidized for 40 min. or less the arc velocity and the effective work function of the cathode are directly related, a decrease of the effective work function corresponding to an increase in the arc velocity. For oxidation times exceeding 40 min. the simple relation is no longer valid, indicating that the effective work function under the conditions of the breakdown voltage tests was not the same as that operative during the arc velocity measurements. This change in effective work function on relatively thick oxide layers may be explained by considering in detail the emission mechanisms for the two cases.

An explanation of the results of experiments on surface roughness and oxidation may be attempted with the aid of a simplified arc model. The cathode 'spot' is believed to consist of a number of emitting sites, electrons from which are accelerated through the fall region and ionize at the base of the arc column. The ions so formed drift to the cathode, but because of the transverse magnetic field they strike the cathode on the Amperian side of the spot. (For modification of this model to account for behaviour at low pressure where retrograde motion occurs, see ref. 4). This ion bombardment ahead of the existing cathode spot conditions suitable sites to take over the arc current when the emission efficiency of the existing sites decreases. Thus arc movement would occur by a series of micro-jumps of the individual sites and the magnitude of the arc velocity should be a function of the ease of conditioning new sites, and of the rate of decay of emission efficiency of the existing sites. It should be pointed out that the mechanism of electron emission from a site at the instant of current transfer to it need not necessarily be the same as that when the site has become established. It is believed that the conditioning of new sites occurs by a process of surface charging due to positive-ion bombardment, which lowers the effective work function, and that at the instant of current transfer a field emission process predominates. Thus a roughening of the cathode surface could lead to localized high-field regions due to asperities and the sites ahead of the existing spot should then require less conditioning. In addition, surface oxide layers which alter the effective work function will also control the emission. The rate of surface charging for various thicknesses of oxide layer cannot be explained simply, and to obtain a realistic picture it is necessary to consider the mode of electron transfer through a semiconductor oxide film with a surface charge of positive ions. It is then possible to explain the shape of the velocity and breakdown voltage curves shown in Fig. 2.

Further experiments on stainless steel, copper and platinum, in air, nitrogen and hydrogen, for both Amperian and retrograde motion, have yielded considerable evidence in support of the mechanism of motion postulated. It is hoped to publish a far more detailed account of these investigations elsewhere.

The considerable contribution of Dr. A. E. Guile to the earlier stages of this work, and his continued advice and encouragement, are gratefully acknowledged. One of us (P. E. S.) wishes to thank the Department of Scientific and Industrial Research for a maintenance allowance and the Institution of Electrical Engineers for the recent award of an I.M.E.A. Scholarship.

Bulk Conductivity in Organic Crystals

One of the basic problems in the study of bulk conductivity phenomena (dark- and photo-conductivity) in organic crystals is the apparent energy deficit in the difference between the ionization energy of the molecule in the crystal and the energy supplied by the exciting radiation. An excellent review of this problem is given by Garrett[1]. All current efforts to resolve this difficulty have been concerned with the energy balances within the crystal, excluding the electrodes, with the goal of explaining how a charge separation is produced inside the crystal.

There is, however, another mechanism for explaining the observed conductivity, and that is to assume that the carriers are produced at the electrodes. This process in organic crystals would be classified mainly as one of hole injection into the adjacent crystal from the electrode. The experimental basis for this picture has been given in a preceding paper[2].

In these experiments an anthracene crystal was provided with electrolyte electrodes. One electrode compartment was filled with 1 *M* sodium iodide solution saturated with iodine, while the other electrode compartment was filled with 1 *M* sodium iodide solution without iodine. The dark current which flowed when the iodine compartment was made electrically positive was 22 times that when the iodine compartment was negative and 80 times the dark current when neither compartment had any iodine. These results were explained by assuming that the iodine extracted an electron from the adjacent anthracene crystal, becoming an I^- ion, thereby injecting a positive hole into the anthracene.

The energy balance for the process of hole injection can be described as follows: I_A is the energy required to take an electron out of solid anthracene, creating a positive hole A^+ (*s*) in the solid and freeing an electron e^- in the gas. If, further, W_E is the energy required to remove an electron from the electrode and E_X the energy externally supplied (optically or thermally), we have the following energy balance for the process of hole injection:

$$W_E + E_X - I_A > 0 \qquad (1)$$

In the same way, one can describe the condition for electron injection into anthracene. If W is the energy freed when an electron is absorbed in anthracene, then the condition for electron injection is:

$$W_A + E_X - W_E > 0 \qquad (2)$$

I_A is given in the literature[1] as about 6 eV.; our estimate is between 5 and 6 eV.

Applying equation (1) to the case of hole injection from an unilluminated I_2 electrode, E_X is small, of the order of thermal energy: W_E is about 6·2 eV., calculated as follows:

$$\mathrm{I(aq)} \rightarrow \mathrm{I}(g) + \sim 0 \text{ eV.}^{4} \qquad (3)$$

$$\mathrm{I}(g) + e^-(g) \rightarrow \mathrm{I}^-(g) + 3{\cdot}2 \text{ eV.} \qquad (4)$$

$$\mathrm{I}^-(g) \rightarrow \mathrm{I(aq)} + 3{\cdot}0 \text{ eV.} \qquad (5)$$

$$\mathrm{I(aq)} + e^- \rightarrow \mathrm{I}^-\mathrm{(aq)} + 6{\cdot}2 \text{ eV.}; \; W_E = 6{\cdot}2 \text{ eV.} \qquad (6)$$

The energy balance is seen to be favourable for the extraction of an electron from the anthracene, and the injection of a positive hole into the anthracene. At the opposite electrode, the process is the discharge of the positive hole, similar to the discharge of an ion at a metal electrode, probably producing free iodine.

When external radiation is absorbed by I_2 (and also I_3^-), its dissociation into iodine atoms is greatly increased[3]; on the above basis, hole injection should also be increased, as is indeed the case[2]. Thus, when 4360 Å. radiation was used, the enhanced dissociation when the iodine electrode was at a positive potential increased the current by a factor of 16,000 over the dark current.

This radiation does not excite the anthracene crystal and need not contribute directly to the electron extraction process. This process of hole injection can occur with any electrode, for which the energy balance is positive as indicated in equation (1). For example, the replacement of I_2 by Ce^{4+} solution produces a large increase in the dark current.

The case where the external radiation is absorbed by anthracene in contact with salt solutions containing no iodine produces hole injection in a similar way. It is assumed that when the exciting radiation is absorbed (3650 Å.), excitons are produced. Most excitons are found near the illuminated electrode, frequently colliding with the electrode. During a collision, the injection of positive holes is possible if equation (1) is satisfied.

The energy balance at the electrode in contact with the excited anthracene (A^*) surface is:

$$A^*(s) \rightarrow A(s) + E_X; \; E_X = 3{\cdot}3 \text{ eV.} \qquad (7)$$

$$e^-(g) + \mathrm{H_2O(aq)} \rightarrow \mathrm{H_2O^-(aq)} + W_E; \; W_E = 3{\cdot}8 \text{ eV.} \qquad (8)$$

If these values are placed in equation (1), using a value of 5·5 eV. for I_A, there is an excess in energy of about 1·5 eV. for the injection of a positive hole into the anthracene.

Step (8) involves the capture of an electron by a water molecule[4]. The resulting ion is unstable and will dissociate, probably forming hydrogen and hydroxyl. At the opposite electrode, the discharge of the positive hole is accomplished as at an ordinary electrode.

The major influence of the positive electrode on the bulk conductivity is further indicated by the comparison of the electrode efficiencies of Cl^- and I^- solutions[5]. The replacement of Cl^- by I^- decreases the positive current flowing away from the adjacent anthracene surface by a factor of 13. This reduction clearly indicates that most of the current is produced at the electrode adjacent to the excited region of the crystal.

Some conclusions may also be drawn about the nature of the current ($i-$) which flows when the illuminated side of the crystal is at a negative potential. The injection of negative carriers into the anthracene is probably also energetically feasible, but apparently this process is not probable ($i-$ is small). This may be due to the low mobility of the electron in anthracene. Our results, moreover, lead to the conclusion that most of this negative current is actually due to the interaction of fluorescent light with the electrode–anthracene surface not directly illuminated by the incident light. This interaction produces positive holes which then flow to the negative electrode.

This conclusion is based on the following observations: the magnitude of $i-$ is markedly affected by the nature of the electrode distant from the light, and in the same way that the positive current is affected; the $i-$ has almost the same dependence on the exciting light intensity as the positive current; both negative and positive currents are saturated at about the same voltage, although at greatly different currents. The latter result cannot be explained by assuming the formation of an internal space charge, since in this case an increase of the field would cause a large increase in the photocurrent; this does not occur.

The existence of a true negative current within the anthracene is, however, not excluded. Internal polarization experiments by M. Silver[6] and M. Pope[7] on polycrystalline layers and single crystals, respectively, of anthracene can best be explained by assuming the existence of trapped negative charge within the crystal. No equivalent positive charge distribution was ever observed. These results, in conjunction with those on photoconductivity, show that the true negative current carried by electrons exists but is exceedingly small.

Most dark currents differ in behaviour from the conductivity described in this communication. They do not become saturated, as do the photocurrents and the dark currents with I_2 electrodes, and they also do not depend on the nature of the electrode.

For the normal dark current, the criterion for positive hole injection would be satisfied if the difference between W_E and A_A can be supplied by thermal action. The extent to which this occurs is as yet unknown.

These considerations do not exclude the possibility of hole and electron production within the anthracene itself by some process of charge separation. Internal polarization experiments indeed indicate that charges are also produced inside the crystal to some extent. However, the findings of this communication show that charge injection can easily occur and is frequently responsible for the large currents observed. For organic materials other than anthracene, calculations also show the possibility of hole injection.

CRYSTALLOGRAPHY

Growth of Single Crystals of Copper

DURING experiments on the effects of alternating deformation on the hardening of single crystals of spectrographically pure copper[1], difficulties were experienced in obtaining reproducible hardening behaviour under the same conditions of alternating straining from 2-cm. long specimens taken from opposite ends of longer crystals. A brief discussion of experiments made to investigate this disparity follows.

The method of crystal growth described by Andrade and Roscoe[2] did not yield a long coherent length of crystal, and growth experiments were therefore confined to a Bridgman-type apparatus[3] inclined about 25° from the vertical. Moulds were prepared from spectrographically pure graphite rod by drilling a 1·6-mm. diameter hole, which was then reamed to a slight taper (1 : 3,000); the reaming also provided a smoother bore. Moulds were baked *in vacuo* before use.

Crystals 25 cm. long could be readily grown using a rate of furnace travel of 3·8 cm./hr., but they were firmly stuck in the moulds at the lower end, due to impregnation of the graphite with copper to a depth of about 0·5 mm. Shorter crystals 14 cm. long were then grown, and these could be removed from the moulds by tapping. However, the yield stress and the initial rate of hardening of a specimen taken from the lower end of a crystal orientated for easy glide were both about three times larger than for a specimen from the top end; the yield stress for the upper specimen was usually about 27 gm./mm.^{2}.

The orientation difference between upper and lower specimens was not obviously greater than the error of orientation determination by the Laue method used[4]. Moreover, spectrographic analysis showed that there was no significant difference in analysis between the two ends of the crystal.

Crystals 10 cm. long were then prepared, and were perfectly free in the moulds. Specimens taken from each end of a crystal gave yield stresses and hardening curves which agreed to within 10 per cent between themselves and with those of the upper specimens of 14 cm. crystals. Further reduction in crystal length did not improve this variability, which was attributed to minor variations in lineage structure (cf. Diehl[5]).

The disparity in results obtained from longer crystals appears to be due to impregnation by molten copper of the porous graphite moulds, resulting in deformation during removal of crystals from the moulds. The extent of impregnation decreases as crystal length decreases, and becomes insignificant in crystals 10 cm. long or less. The effect of the accidental deformation on hardening behaviour is more apparent in alternating straining than in unidirectional testing, since the length of the easy glide region is greater and the rate of hardening is lower[1,6].

This work was carried out at the Australian National University during secondment from the Aeronautical Research Laboratories, Department of Supply, Melbourne. Acknowledgment is made to the Chief Scientist, Department of Supply, for permission to publish this communication.

GEOPHYSICS

Motion of Geomagnetic Field Lines

PRIMARY auroral particles, from the Van Allen radiation belt or interplanetary space, travel down to the upper atmosphere along lines of force of the geomagnetic field. Hence they strike the atmosphere in regions which move with the field lines when these are distorted. The purpose of this communication is to show that this motion of the impact regions can only be very slow, because the high conductivity of the Earth's interior limits the field distortion. This throws serious doubt on the hypothesis of Rees and Reid[1] that a diurnal motion of auroral hydrogen emission through many degrees of latitude may be explained by distortions of the Earth's field. Rees and Reid's theory considers particles from the radiation belt, the orbits of which drift in longitude. Using Alfvén's perturbation method[2], it may be shown that the drifting orbits of this model pass through the same magnetic field lines on each circuit of the Earth and so follow the motion of these lines.

The distortion involved is the horizontal displacement of a force-line at auroral altitudes, say 100 km. For, however distorted the lines at greater heights, this is the displacement of the primary particles where they are observed. The Earth's conductivity may be taken[3] as negligible to 700 km. depth, and as more than 10^{-11} e.m.u. below 800 km. For a period of one day, this latter conductivity gives a skin-depth of 150 km. Thus the displacement of the field lines may be approximated by that for an Earth non-conducting to about 900 km. depth, with an infinitely conducting core below. The lines are immobile in the core, and their displacement in the first 1,000 km. height above that is required.

To maximize the displacement, the magnetic disturbance field is assumed perpendicular to the average or undisturbed field. Consider first the case where the disturbance at all levels equals its value measured at the surface ; this implies a very extensive current source in the ionosphere. In this case it can be shown that the displacement of a field line, in the auroral zone, at 1,000 km. above the conducting core, is about 0·015 Δ km., where Δ is the disturbance in γ (10^{-5} gauss) units.

In the case of more localized ionospheric currents Δ increases with altitude, and the overall effect of this, for a given surface value of the disturbance, is to give a smaller displacement than that above. Consider an overhead cylindrical current causing the disturbance. Then Δ is (A/d), d being distance from the current and A a constant. Therefore, Δ is less than (A/h) where h is the vertical component of d. Taking Δ as (A/h) the desired displacement of a line in 1,000 km. height can readily be found, and it increases slowly as the current diameter is reduced. For a current of diameter greater than about 0·1 km. the calculated displacement is less than the 0·015 Δ km. found before. But for such small diameters, replacing (A/d) by (A/h) causes a gross overestimate of the displacement ; and furthermore, ionospheric currents have a much larger scale than 0·1 km. Adding the disturbance due to the induced current in the core does not alter this result.

Thus the displacement of 0·015 Δ km. (Δ in γ) is an upper limit to the movement of auroral phenomena due to field distortion. This distance is very small. It equals 50 km. (almost ½° of latitude) only if Δ has the extreme value of 3,300γ ; while if Δ is less than 1,300γ, as in most magnetic storms when the K index does not exceed 7, the displacement is less than 20 km. Only by very slow changes, such as those with the period of the sunspot cycle, can the lines of force be moved through great distances at low altitudes.

Observations of the radiation points of auroral coronæ[4] show that the displacements of the field lines between the Earth's surface and the auroræ are well within the limits expected from the foregoing.

GEOCHEMISTRY

High-pressure Phase Transformations in Laboratory Mechanical Mixers and Mortars

THE mechanical action of simple laboratory grinders, mortars and similar devices has occasionally been used to assist in chemical reactions in addition to performing their primary physical functions. Among these chemical reactions are phase transformations. That the effect is due to some kind of a pressure component in the mechanical action may appear obvious, but the magnitude of the pressures is not readily appreciated, nor can it be calculated or measured. However, in the course of work in this laboratory on the high-pressure polymorphism of lead dioxide (PbO_2), the information that a phase identical with the new high-pressure polymorph, which had been shown to be stable only in the region above 10,000 bars, had been formed by simple grinding[1] was noted with no little surprise. The observation was promptly confirmed by grinding a small amount (2 gm.) of the common rutile form (I) of lead dioxide in a mechanical mortar and pestle combination of laboratory pattern. Grinding in air for a few hours converted an estimated one-third to the denser orthorhombic form (II). After preliminary work, it transpired that nothing new in principle had been added to some similar results which had been reported by Burns and Bredig[2] on the transformation of calcite to aragonite by grinding in a mortar. The high-pressure phase was formed from the low-pressure one, the amount of change was dependent on time, and subsequent heating would form the low-pressure phase. A significant difference is that phase equilibrium and thermochemical studies[3] place the calcite–aragonite transformation at about 3,000 bars at room temperature, which is considerably lower than the 10,000 bars necessary for the lead oxide $\mathrm{I} \rightleftharpoons \mathrm{II}$ transformation.

The obvious question that arises is whether or not the high-pressure types are actually being formed in their field of stability, or whether the shearing stresses so dominant in such an environment either alter the relative free-energy relations of the two forms or permit metastable nucleation of the high-pressure phase. Therefore, other substances with known p–t relationships between polymorphs (work in this laboratory, with L. Azzaria and W. B. White) were chosen for further study : MnF_2, BeF_2, SiO_2, PbO, Sb_2O_3, B_2O_3 and $BAsO_4$. Their transition pressures at room temperature (extrapolated from our equilibrium data obtained at higher temperatures) are near 9,500, 15,500, 13,500, 5,500, 10,000, 18,500 and 30,000 bars respectively. It was found that grinding for several hours in the mortar assembly under air or nitrogen (where oxidation was a possibility) would produce varying amounts (as determined in every case by X-ray diffraction) of the high-pressure phases of PbO, PbO_2, $CaCO_3$, MnF_2, Sb_2O_3 and BeF_2 (questionable) in decreasing order. Also of new but related interest is our finding that the 'quenchable' transitions in calcium carbonate and lead dioxide and in many other selected phases could be effected (partially), in a few minutes to 2 hr., by the action of a small rapidly vibrating mixer-grinder. The type used (trade name 'Wig-L-Bug') is common in spectroscopic laboratories and was used with a metal vial and ball and 50–100 mgm. of sample. Furthermore, it was found that the same (*vide supra*) relative effectiveness in forming detectable amounts of the high-pressure phases was evident in the action of the 'Wig-L-Bug'. Of the highest-pressure phase, BeF_2 (cœsite), only a trace was formed. Making allowances for the very sluggish nature of the quartz-cœsite transition of silica and the more complex relation[4] and serious hydration problem in the new high-pressure B_2O_3 polymorph, it appears that pressures in the region of 10–20,000 bars are being

Supplement to NATURE

No. 4718 APRIL 2, 1960 Vol. 186

MEDICINE IN SHAKESPEARE'S WRITINGS

Shakespeare and Medicine

By R. R. Simpson. Pp. vii+267. (Edinburgh and London: E. and S. Livingstone, Ltd., 1959.) 25*s*. net.

According to Chambers's bibliography on authorities on books on Shakespeare, comprising some 450 volumes, only one deals with the medical aspect of Shakespeare's writings, that by Dr. John Bucknill, which appeared just a century ago. The present book by Mr. Simpson is therefore opportune. It is based on lectures to various medical societies and its object is "to record the medical references in the plays and poems, to assess Shakespeare's knowledge of the medicine of his day, to consider the uses to which he put it and to discuss some of the possible sources of his medical knowledge". Although the study was undertaken primarily from the medical point of view, it should be of interest to the literary reader even though it makes no purely literary contributions. Any fresh study of Shakespeare is of interest and value.

The author has collected more than seven hundred medical references, major and minor, and classifies them under twenty pertinent headings. The discussion of these entails some overlap and consequent repetition which detracts from the interest if the book is read as a whole. This drawback would not appear if various sections were used for reference or for lectures.

Mr. Simpson emphasizes that Shakespeare often uses a medical image to illustrate a point, or a medical situation at a moment of dramatic intensity. Among notable passages he recalls is the brilliant description of death in the typhoid state as it befalls Falstaff in "Henry V". Also the quite remarkable description of tertiary syphilis in "Timon of Athens", IV, 3.

It is not possible to say whether Shakespeare was acquainted with the literature of contemporary Elizabethan medicine, but that he was certainly aware of current medical thought is evident from numerous quoted passages. This inevitably leads to the question of how much Shakespeare learned from and was influenced by Dr. John Hall, the physician who married his daughter and who lived and practised in Stratford. In an interesting chapter on this subject, Mr. Simpson proves quite definitely from a chart giving the plays in their chronological order and the numbers of medical references in each that any influence must have been slight. Hall did not enter Shakespeare's life until 1600, and up to that year the plays contain 215 major medical references; after 1600 there are 225.

Shakespeare's references to almost all aspects of human activity and life are so rich and so strikingly apt that one could make a fair comparison with almost any important profession or calling just as with medicine, and this would not necessarily imply he had special connexions. His genius enabled him to embrace so much with clarity, ease and conviction.

Any doctor with literary interests will profit by reading this book. Any non-medical student of Shakespeare should be familiar with its presentation of an important aspect of the plays and poems. It is a good reference book for the doctor and a useful bedside book also.

RUSSELL BROCK

THE ROYAL COLLEGE OF SURGEONS OF ENGLAND

The Royal College of Surgeons of England

A History. By Sir Zachary Cope. Pp. xii+360+78 figures. (London: Anthony Blond, Ltd., 1959.) 63*s*.

Since his retirement from active surgery, Sir Zachary Cope has become a well-known and trusted public servant. He has also produced a series of learned writings on the history of his own profession, not the least of which is the surgical record of the Second World War. In all these works he has shown good sense, good temper and good judgment. Here he displays these qualities towards a famous corporation of which he has long been a prominent member. Its story is by no means one of continual progress nor always even wholly edifying, yet he makes no attempt to cover the bad patches. But the record has had a happy development in the last generation under the guidance of men of temperament comparable to that of the author himself.

It must be remembered that until about a hundred years ago, in England—and in England alone of the Western countries not excluding Scotland and Ireland—serious instruction in the practice of medicine was not held to be any part of the duty of our ancient universities. These had, of course, nominal professors of medicine, of anatomy, and of other para-medical subjects, but their teaching—so far as it existed—was of book-learning and not on practical lines. By this time certain of the 'new universities' were giving medical degrees. But before the rise of the new universities, almost the usual way to become an effective practitioner was through apprenticeship to a surgeon with the view of becoming a Member of the Royal College of Surgeons of London. This body was instituted as such in 1800. To it were consigned, by Act of Parliament, the magnificent collections of John Hunter.

The College thus constituted had a very defective constitution. Its Council was self-elected and elected for life. It thus came to consist largely of aged and often eccentric men, though it also contained some of the highest eminence. This Council acted as examiners, and the examination was entirely oral. There was not even a syllabus for several decades. The result of all this was that the process became a rather sour joke. Mr. Bob Sawyer and Mr. Benjamin Allen must have been fairly average students of those bad old days. The process of transforming the type of student began when the Society of Apothecaries, in 1815, succeeded in becoming incorporated and introducing a reasonable examination of its own. About this time the term 'general practitioner' was introduced. The best qualification for such men was membership of the Royal College of Surgeons and licentiate of the Society of Apothecaries (M.R.C.S., L.S.A.). The weakest point in the curriculum was inadequate attention to what is now called 'internal medicine'. Yet such are the delaying possibilities of institutions that it was not until 1885 that the Royal College of Physicians joined the Royal College of Surgeons in establishing a 'Conjoint Board', the diploma of which (M.R.C.S., L.R.C.P.) covered all aspects of general practice. This became the standard qualification of such gentlemen until the beginning of the present century.

The major operations of surgery were naturally always undertaken mainly by a special class, usually attached to teaching hospitals. The status both of these and of the College itself was raised by a charter of 1843 under which certain Members of the College became Fellows. This distinction was conferred from 1844 onward by a special examination, and the diploma F.R.C.S. remains evidence of high competence in the art and was almost necessary for the coveted 'honorary' surgical appointments at the larger hospitals. These Fellows themselves elected the Council, membership of which became, in itself, a high professional distinction.

In the early twentieth century it looked as though the medical degrees of the new universities might take the place of the diplomas of the Conjoint Board, and this process is continuing. But under the wise and genial leadership of the late Lord Webb-Johnson, who presided over the College of Surgeons from 1941 until 1948, that institution was transformed from being mainly a diploma-granting body into one of higher surgical education. It has since attracted great numbers of students, especially of those who seek the diploma of F.R.C.S., and has become the chief place in Britain and, indeed, of the Commonwealth, for the training of such men. Thus the functions of the College have become largely, if not mainly, changed almost beyond recognition.

Sir Zachary's account of the College is supplemented by one of its great library by its librarian, Mr. W. R. LeFanu, and of John Hunter's Museum by its anatomical curator, Miss Jessie Dobson, who knows more about that institution than anyone living. The importance of the Hunterian Museum can be judged by recalling that its staff has included Richard Owen, Arthur Keith, Frederick Wood Jones and many other great men of science. Sir Zachary has provided a readable and often amusing account of a great and characteristic national institution.

CHARLES SINGER

EARLY SCIENCE IN CHINA

Science and Civilization in China

By Dr. Joseph Needham, with the collaboration of Dr. Wang Ling. Vol. 3: Mathematics and the Sciences of the Heavens and the Earth. Pp. xlvii + 877 + plates 21–95. (Cambridge: At the University Press, 1959.) 150*s*. net.

THE first two volumes of this monumental work introduced the reader to the intellectual background of scientific thought in China from the earliest times to, roughly, the Newtonian era; in this third volume Dr. Needham discusses in great detail the beginnings and developments of Chinese mathematics and natural science within the same temporal span. To many students of the history and philosophy of science, this volume will be a revelation of the achievements of a civilization isolated almost entirely from Western and other Eastern influences until the arrival of Jesuit missionaries at the end of the sixteenth century. For this immense and astonishing work of erudition no praise can be too high; the author has an impressive knowledge of Chinese culture to add to his eminence in the field of natural science; and so we have a volume authoritative, fascinating and illuminating, sure in the unravelling of the complexities of the evidence, and with a shrewd appraisal, on appropriate occasions, of contemporary Eastern and Western progress in the sciences.

First and briefly as to the section on mathematics. Dr. Needham points out that, whereas Greek mathematics was deductive in character, particularly in geometry, the Chinese approach was mainly arithmetical and algebraic in essence and concerned to a large extent with utilitarian problems in mensuration, the calendar and so on. It is not surprising that, handicapped as they were by an unwieldy notation, the Chinese were unable to develop purely algebraic—as distinct from arithmetical—methods in dealing with such problems as the solution of quadratic and cubic equations and the method of finite differences. But, within these limitations, their progress was anything but negligible, however uninterested as they apparently were in abstract inquiries.

The longest section of the book is on astronomy; here the story is different, and a complete refutation of the dogmatic and ill-informed statement of Whewell, the famous Master of Trinity, who declared a little more than a century ago that: "We find no single observation, or fact, connected with astronomy in the Chinese histories, and their astronomy has never advanced beyond a very rude and imperfect condition". A substantially similar statement appears in a very recent "History of Astronomy". The fact is that, as Needham says and as is borne out by the evidence, the Chinese were the most persistent and accurate observers of celestial phenomena anywhere in the world. It is noteworthy that for several centuries before the tenth century A.D. the Chinese astronomical records are the only ones available; again, Laplace paid considerable attention to the ancient and medieval determinations of the obliquity of the ecliptic—the oldest going back several centuries B.C.—in his researches on the secular changes in the obliquity.

Chinese astronomy differed in one marked respect from Greek astronomy. In the latter, the ecliptic was the fundamental plane, for the main interest centred on the positions and movements of the Sun, Moon and planets, the stars being relegated to a hypothetical crystalline sphere. The Chinese, on the other hand, adopted the celestial equator as the fundamental plane for their observations, particularly of circumpolar stars; from this followed two important advances in instrumental design. First, the invention of the equatorial mounting applied to such instruments as the armillary sphere, and second—and most remarkable—the invention in A.D. 132 of the clock-drive, when an armillary sphere was rotated by means of a water-wheel controlled by a clepsydra or water-clock. Against this, the choice of the equatorial system of co-ordinates—and most of all, the non-deductive character of their mathematics—militated against any real progress being made in the understanding of planetary motions.

Large number of eclipses were recorded in Chinese annals from 720 B.C. onwards, and the dates of many of these have been corroborated in recent times, to the great advantage of modern studies.

We owe to Chinese (and Japanese) astronomers the recording of the first super-nova (now identified with the Crab Nebula) which, at its brightest was visible in daylight. Novæ, the earliest of which was observed about 1300 B.C., were described as 'guest-stars' and as such were believed to show the approval of the heavens for the dynasty in power.

Bare mention can only be made of the observations of sunspots, comets, meteors and meteorites, variable stars and, in the final sections of the book, to the study of meteorological phenomena, cartography, seismology (including the earliest known form of seismograph), palæontology and mineralogy.

In conclusion, one can only refer in a word to the magnificent photographs which lavishly adorn the book.

W. M. SMART

HERBERT SPENCERISM

The Integration of Human Knowledge

A Study of the Formal Foundations and the Social Implications of Unified Science. By Prof. Oliver L. Reiser. Pp. xvi+478. (Boston, Mass.: Porter Sargent Publisher, 1958.) 8 dollars.

HERBERT SPENCERISM is the persistent and mistaken idea that apart from particular scientific investigations for particular purposes there is yet another subject, a super-science, which consists in doing something with the results of these special investigations. Reiser wants to have colleges of integration, staffed by people doing this. The trouble is that it is never made clear what they would be doing. Scientists investigate definite hypotheses, but what would super-scientists do? Would they produce and synthesize abstracts all day, and if they did, what exactly would this work of synthesis be? Reiser complains that in previous centuries universities used to do this synthesizing but that now they fall short of it. But surely all that has happened is that so much more has been found out. This raises no problem other than that of getting an efficient abstracting service.

It is not possible to gather what Reiser means by 'integration', either from his precept or his practice. He defines integration as the extraction of common principles from the special sciences and the use of these in developing a universal world view (p. 387). This sounds like a proposal to use methodology for the purpose. But he also tells us that integration has a social basis, namely, cultural unity, and it is not easy to see how the study of methodology could give rise to cultural unity. To tell us that the social basis of integration is cultural unity is to tell us that when people think alike they think alike. This brings us no nearer to an understanding of his use of 'integration'. Elsewhere integration is defined as putting together information from different fields; and the task of philosophy is defined as that of integration (p. 7). It follows that a philosophical problem is a problem about how to put bits of information together. But the integration, we are told, has to be based on the use of materials from those fields which are relevant to the philosophical problem. So the integration has to be based on what is relevant to the integration. This tells us nothing.

The book itself is cited as an example of integration. It should be possible, therefore, to gather what is meant by the term by looking at Reiser's own practice. The plan of the book is to pass chapter by chapter from the foundations of knowledge (logic, mathematics, methodology, semantics, epistemology) through the special sciences to a final synthesis. In each chapter the main points of view on a given field are outlined and then 'synthesized'. Again, reading the results of this procedure brings us no nearer to an understanding of Reiser's use of 'integration'. For his procedure is that of eclectic collation of views based upon his own approval and disapproval.

It might be asked why we need this synthesis. Reiser's answer is that it is essential for the establishment of a unified world society. He admits that it is also essential that the Russians should adopt his views. He says that society will remain confused until we know the answer to the question "What is knowledge for?" and that this question cannot be answered until our knowledge is complete (p. 258). But in that case, the question never will be answered. We do, in fact, already know the answer. For knowledge is valued both as a means and as an end. We need no institute of integration in order to find this out. We also know that a question as general as this will admit of an answer only in equally general terms. If this is felt to be unsatisfactory, the solution is not to produce yet further verbalisms but to ask more specific questions.

There is a unity of science already, all the unity that there need be. All that is needed to obtain it in any given case is to get a group of specialists working together on one project. It is up to those who say that such a group stands in need of further 'unification' to specify intelligibly what they mean. The fallacy involved in the demand for synthesis is a Platonic fallacy. It is the view that knowledge is contemplative; that in order to 'know' science someone has to acquire and put together (in a manner which is never specified) all the results from all the sciences. But science consists in the exercise of certain manual and conceptual skills, and the unification of these skills is attained by the co-operation of specialists for definite purposes. There is nothing else in the way of synthesis to be done. Reiser's book illustrates the effects of nevertheless trying to do it.

JOHN TUCKER

HUMAN RITES

The Rites of Passage

By Arnold van Gennep. Translated by Monika B. Vizedom and Gabrielle L. Caffee. Pp. xxvi+198. (London: Routledge and Kegan Paul, Ltd., 1960.) 23s. net.

FOR many years the author of this book was professor of ethnography in the University of Neuchâtel and particularly well known as an authority on popular traditions, legends and folk-lore. In 1909 he published his ideas on these subjects in a book entitled "The Rites of Passage" and this arresting title has now established for itself a place in the vocabulary of the anthropologists. In our journey through space-time we have to pass through many passages which lead from one period in our lives to another period. For example, there are the passages from infancy to childhood, from childhood to adolescence, adolescence to adulthood, and finally the abrupt passage through the doorway of death, either to annihilation or to an entirely different form of life beyond the grave.

Gennep has noted two facts about these transition periods of man's life. The first is that each of these movements has its appropriate rules and rites and that the ceremonies which accompany them are very much the same in all civilizations and cultures. He also directs attention to the fact that these cultures accentuate the existence of two particularly sharp divisions in society, the first being the sexual division between the men and the women and the second the magico-religious division between the religious members of society and the profane members. He gives a description also of the secondary groupings of the various age-groups, the family units and the politico-administrative and territorial units.

Life entails for everybody many separations followed by subsequent re-unions, and one of the author's main purposes in writing this book was to investigate the precise significance of the rites which are, and which always have been, associated with these passages of separation and re-union. This led him to investigate the various initiation rites in the mystery religions of Egypt and Greece, religions which exerted a great influence on the ceremonies and rituals of the Christian Church in its early formative years. Indeed, it may be said that the rituals of the Catholic Mass are representations of a number of transitions and incorporations, the only difference between these and the initiation rituals of the old mystery religions being that the initiation ceremonies of the Mass are never final but are always being renewed.

Arnold van Gennep's book covers a great deal of ground, and it should be of interest not only to anthropologists but also to students of religions. Its appearance in an English edition is to be welcomed.

KENNETH WALKER

AFRICAN CULTURES

Continuity and Change in African Cultures

Edited by William R. Bascon and Melville J. Herskovits. Pp. vii+309. (Chicago: University of Chicago Press; London: Cambridge University Press, 1959.) 52*s*. 6*d*. net.

THIS is one of the better collections of essays on Africa that have appeared in recent years. The introductory essay by the editors is an excellent summary of the problem, directing attention to some of the basic approaches to the subject which are too often lost sight of in the hurry of modern research. Four essays deal with "Africa as a Linguistic Area" (Greenberg), "African Art" (Cordwell), "African Music" (Merriam), and "The Factor of Polygyny in African Demography" (Dorjahn). The remaining nine are regional or tribal studies, two of them dealing with eastern Africa, one with the north-western Belgian Congo, and the rest with west Africa. Though there are three maps, illustrating language groups, culture groups, and music areas, it would have been helpful if a map had been included showing where the peoples studied are to be found.

Although the subject of the book is specifically "continuity and change in cultures", there is none the less a good deal of information about various aspects of the peoples represented; and unlike so much modern work on Africa, the book is mercifully free, to a great extent, from the jargon and involved writing that seems to be considered a necessary element in social anthropology to-day.

Of particular interest to historians should be the essay on "Ethno-History in the Study of Culture-Change in South-east Africa", which is an interesting, informative, and well-documented study, though it needs a map of its own; in fact each of the regional essays would have benefited by a map.

In his account of the Pakot (better written Pokoot), Prof. Schneider might have added the story of how Chaundy managed to persuade the people to use their stocks of cow-dung for fertilizer instead of keeping them merely as visible indicators of wealth, but gave up doing it when he had gone.

Although the book is intended as a study of various aspects of acculturation, it forms quite a useful introduction to the peoples with which it deals. The essay on "African Art" is a comprehensive survey of art throughout the continent, concentrating mainly, as is to be expected, on West Africa; but there are short sections on Eastern and Southern Africa and the Congo, and on modern African art. The author notes that "there are few African cultures where the concept of 'art for art's sake' seems to have existed"; I wonder if this is really true. The essay which follows this, on African music, is equally comprehensive.

At a time when so many anthropological studies of Africa tend to be of the 'social anthropological' kind, it is good to come across a book like this which deals with facts, and allows the facts to retain their importance. Though some of the essays in the book are within the field of social anthropology, the importance of the facts on which they are based is not minimized. This book is altogether to be recommended to those who wish to know more about certain aspects of African cultures before the countries in which they are found become independent and possibly undergo change in a different direction.

G. W. B. HUNTINGFORD

SELF-REGULATION FOR CHILDREN

The Free Family

A Creative Experiment in Self-Regulation for Children. By Paul and Jean Ritter. Pp. 269+4 plates. (London: Victor Gollancz, Ltd., 1959.) 18*s*. net.

THE authors of this book were inspired by the teachings of Wilhelm Reich and the example to A. S. Neill to bring up their five daughters in accordance with the principle of 'self-regulation'. According to this principle, children should be left to work out for themselves how they shall behave; when and what they shall eat, when they shall sleep, when eliminate, and so on. Adult interference is kept to the minimum necessary for the children's safety, and to prevent them from becoming too much of a social nuisance. Their lives begin with the birth procedures advocated by Dr. Dick Read.

On their own evidence, the authors appear to have carried this principle into action as successfully as is possible in a society which advocates quite different principles of upbringing. But their success seems to have depended on their being highly cultured, reasonably well-to-do and enjoying a good deal of leisure; and, what was more important, on being intelligent and exceptionally well-balanced and loving, so that they were able to tolerate the discomfort and mess which the children's self-regulation entailed. Although 'tension' inevitably arose, they were willing to accept this and to acknowledge that they were the probable cause—in their own words "everybody is silly sometimes". Even then, it is clear that the children experienced considerable difficulty in adapting themselves to the society of children very differently brought up.

This book is not of course a scientific document. We need independent evidence as to whether the children did in fact emerge with the degree of spontaneity, poise and stability which their parents claim for them. To prove the authors' thesis, studies must be made of many more and different families employing self-regulation. Only then shall we know whether self-regulation can be practised successfully by more than the fortunate few. By all means let parents be stimulated to try these methods; but let them realize well in advance what they are setting out to do.

M. D. VERNON

MOTIVATION

Motivation

A Systematic Reinterpretation. By Prof. Dalbir Bindra. Pp. vii+361. (New York: The Ronald Press Company, 1959.) 5.50 dollars.

IT has been clear for at least a decade that our ideas on motivation have been muddled and unable to accommodate some of our data. One way or another the notion has persisted that organisms are inert machines made to behave by instincts, drives, libido, *élan vital*, etc. Many contemporary learning theorists and psychotherapists still hold to this kind of view. Dr. Bindra persuasively marshalls a great deal of research evidence in the hope that they can be brought to change their minds.

The alternative he has to offer translates many motivational concepts into terms of stimulus and habit. We do not have to ask why an organism is active because activity, or irritability, is the property of living matter in virtue of which it is recognized as living. There are biochemical problems here but not psychological ones. What we are concerned with are those aspects of activity which are, or seem to be, purposive.

Not so long ago 'purposive' was shut away in a cupboard with 'consciousness', 'philosophy', 'introspection' and similar skeletons. The biologists, with their comparative freedom from methodological anxieties, have helped to bring it back into use. We can be objective here even though we cannot measure. Purposive behaviour is appropriate, persistent and searching. At the mammalian level, Dr. Bindra claims, most of this behaviour is learned. He suggests two generalizations.

"1. Some degree of repeated or continued exposure to a situation is a necessary condition for the development of activities that are goal-directed with respect to some features of that situation.

"2. Behaviour becomes goal directed by virtue of the fact that certain movements or component responses (occurring in a matrix of general activity) that are accompanied by a given goal are selectively strengthened or reinforced . . .".

This does not sound revolutionary, but the shift of emphasis from the drive to the goal, which is not necessarily set up by a drive, liberates subsequent theorizing, and makes it possible to handle data which traditional learning theory is apt to ignore or explain away.

There is some circularity involved in the new definitions of 'goal' and 'reinforcement', but Dr. Bindra sticks as closely as he can to his evidence and points to experiments instead of verbalizing when he wants to make his meaning clear. Socrates might not have approved, but the method works well enough when we are only groping towards a few empirical formulations.

What does seem clear is that we learn to avoid painful objects. We learn to be hungry (that is, develop a food addiction), and so the old drives cease to be available to us when we try to explain learning.

Dr. Bindra has written a timely and important book. It can bear comparison with Hebb's "Organization of Behaviour" from which it stems. The mixture of theoretical boldness and empirical bias which characterizes work in the McGill Department seems to be what is needed at our present stage in psychology.

J. DREVER

MEMORY AND LEARNING: A NEUROLOGIST'S POINT OF VIEW

Brain—Memory—Learning

A Neurologist's View. By Dr. W. Ritchie Russell. Pp. xii+140. (Oxford: Clarendon Press; London: Oxford University Press, 1959.) 18*s*. net.

THIS book gives the views of a well-known neurologist on the physical basis of memory and learning, to the better understanding of which he applies his extensive and critical appreciation of the effect of brain injuries, on which he is the leading medical (as opposed to surgical) authority in Great Britain. The theme is important and fascinating, for ever since the dawn of history man as a sentient being has pondered the secrets of his mastery of this mysterious universe in which we live. This further approach to our understanding of the brain as the bodily organ of mind is presented with considerable ease and felicity of expression.

Mental processes—themselves dependent upon brain cell activity—are considered in the light of recent neuro-physiological knowledge, which is also applied to a study of their impairment following concussion and focal traumatic lesions of the brain; the result is an enrichment of our understanding of the cerebral mechanism whereby man's dominant position in the universe has been achieved.

The book opens with a survey of some aspects of neuronal physiology, indicating that human thought and reason depend, not on the presence within the nervous system of any special features of the nerve cells themselves, but on the vastness of their numbers and on the utter complexity of their inter-connexions through synaptic knobs on their surfaces and special spikes on their dendrites, whereby potential synaptic activity must be increased to an incredible extent. Much cerebral activity is concerned with the analysis of afferent stimuli in relation to previous experiences composed of memories and their emotional associations. This development of memory and the recognition of the familiar is believed to be effected through a process of neuronal facilitation with the ultimate result that what has been done once can more easily be done again. Intelligence presumably depends upon the capacity of the mind to associate together, rapidly and effectively, vast numbers of such memories, and this can only be if the brain is in a state of what amounts to almost ceaseless neuronic activity. Attention, memory, habit-formation, learning and intelligence all have their emotional aspects which are supremely powerful during early life, and it is the successful control, refinement and integration of these qualities that make possible the subsequent development of the balanced adult personality with perhaps unforseeable possibilities for the future. Considerations of speech and of such pathological states as epilepsy, pain and phantom limb sensations all yield additional information concerning the sensory-motor aspects of the brain–mind relationship.

This stimulating, provocative and at times speculative book is eminently readable and warmly to be recommended, especially for the wisdom of its concluding chapters.

GILBERT HALL

60 YEARS OF LEARNING THEORY

Theories of Learning

By Prof. Ernest R. Hilgard. Second edition. Pp. ix+563. (London: Methuen and Co., Ltd., 1959.) 45*s*. net.

THE first edition of this book appeared in 1948. In the intervening years, a considerable amount of experimental and theoretical effort has been devoted by American psychologists to the study of learning with, so it seems, no very radical advances being achieved. The work begins with E. L. Thorndike and proceeds by way of chapters on the major stimulus-response theorists, notably Skinner and Hull, and on the other group of theorists which the author designates the cognitive. The latter include those making use of gestalt conceptions with their implication of an emergence of qualitative differences in learning and problem-solving, as between lower and higher organisms, rather than a quantifiable dimension from simple to complex. These tend to infer more freely the existence of central brain (ideational) processes in accounting for observed behaviour modifications, whereas the former tend to explain in terms of peripheral intermediaries such behaviour as the goal-directed sequence of a rat running through a maze to a distant food-box.

The author makes clear that these two groups of theories each include a diversity of points of view around the central distinguishing characteristic of peripheral or central explanations. He points out that probably the major issue, which cuts across both groups, is that of the role of reinforcement and drive in learning. Some writers have supposed that, in the first instance, learning may occur simply through associative contiguity, the achieving of a reward or the avoiding of a punishment serving merely to facilitate the occurrence of the learned behaviour on subsequent occasions. Others have maintained that learning does not occur at all unless some kind of reinforcement is available to the organisms in the learning situation. The crux of the matter between these two points of view lies perhaps in the kind of definition given to the term 'reinforcement'. It need not consist merely in obtaining a primary goal, such as food or avoidance of electric shock, or secondary (acquired) goals such as counters or verbal praise or punishment. It may also derive from the reduction of tensions set going, for example, by the animal's propensity to explore its environment. The discussion of these problems, together with other current developments, including the role of mathematical models in the construction of learning theories, is contained in three new chapters which constitute an important addition to the first text.

Changes and additions to the historical core of the text are to be found in the chapter on Hull, where his later postulate system is assessed, in the discarding of the chapter on Wheeler's organismic psychology, and in the inclusion of a new chapter of 38 pages on Freud's psychodynamics. Wheeler's omission represents a loss of little significance, but it is not clear that Freud's irruption into a historical text dealing with theories derived almost entirely from experimental data constitutes a substantial gain. The author says: "If there is any teaching which has come from Freudian psychology it is that motives are organized in some sort of hierarchy within the individual, resulting in a value-system expressed in behaviour" (p. 348). But the key to this inclusion seems to be the awareness that motivation, whether in its conditioned or its instinctive form, is very inadequately dealt with by most learning theorists.

In considering the organisms from which learning data and theory are derived, it is common knowledge that the animal favoured by psychologists has been the rat. Index references confirm the rat's priority over all other laboratory animals in the ratio of about 2 to 1. References to human learning make up a poor second to the rat. Allowing for the experimental conveniences of rats as learning-apparatuses, this still must constitute a severe restriction upon the general and comparative significance of the learning theories discussed. Indeed, it would seem justifiable to describe most stimulus–response theories as rat-derived, most cognitive theories as primate-oriented. This is a defect, not in the author's scope, but in the range of the work which he is very ably sampling. A vital corrective to this species-restriction is necessary, and much may be learned by learning theorists from the experimental–ethological studies of Thorpe, Tinbergen, and others.

We are left with the view that there may turn out to be several different types of learning which, at the present stage of theory construction and experimental evidence, cannot be resolved by single theory treatment, even of the promising mathematical model variety. But, although our reading of this book should lead to a critical dissatisfaction both with the theories and with the supporting evidence, the author has, in general, produced an invaluable historical survey and appreciation of current trends which merits the careful study of every student of behaviour.

K. R. L. HALL

SOCIAL SCIENCE, CRIMINOLOGY AND PSYCHIATRY

Social Science and Social Pathology
By Barbara Wootton, assisted by Vera G. Seal and Rosalind Chambers. Pp. 400. (London: George Allen and Unwin, Ltd., 1959.) 35*s*. net.

THE discrepancy between the brilliant achievements of the natural sciences and the slow progress of social science is one of the most disturbing features of our civilization. Recently there has been a good deal of stocktaking among social scientists. What is the scope of this field of study and what are its methods of research? Is there only one social science or are there several social sciences? What ought to be the relationship of social science to the two fields of study most closely concerned with human behaviour, that is to say, psychology and psychiatry? Lady Wootton tries to answer some of these questions in this book written in anger and without pretence of scientific detachment. It is addressed to the interested lay person.

The work falls into three parts. The first presents a critical survey of contemporary research into the origins of crime. Twelve hypotheses are listed and found wanting. Theories about the role of the broken home and the lasting effects of maternal separation or deprivation on behaviour come in for special criticism. Many of the strictures are justified, but none of them is new. Lady Wootton believes that criminological research has achieved very little and that progress is unlikely unless social science rids itself of evil influences. She regards the rise of psychiatry as its greatest danger. Her book can be viewed as a desperate attempt to halt this threat.

Lady Wootton detests imprecision and uncertainty. She insists on clear boundaries, especially between the bad and the mad. Unfortunately, such boundaries do not exist in Nature. She blames the psychiatrists for the existing confusion. In Part 2, which is entitled "The Contemporary Attitude to Social Pathology: the Social Implications of Psychiatry", Lady Wootton sets out to show psychiatrists up for what she thinks they are, namely, unscientific, ignorant and power-hungry empire builders. She deplores the intrusion of psychiatric concepts into social science. She has nothing good to say about psychiatry, except that it has had a humanizing influence. She takes a great deal of trouble to show that the concepts of mental health and mental hygiene are ill-defined and influenced by ethical premises and value judgments. She is particularly severe on the notion of adjustment.

All this amounts to the statement that there is no clear boundary between mental health and mental illness. Lady Wootton presents this as if it was a discovery which ought to disqualify psychiatry from having a say in the study of antisocial behaviour. The reader is led to believe that those uncertainties are specific to mental health and illness. In fact, they also exist in physical health, which is a concept equally elusive of definition and no less 'value-soaked' than mental health.

The intelligent reader will take heart from the knowledge that medicine has not done too badly even without such a definition. Nor has the scope of physical medicine remained static. Many conditions which are now treated by the physician were not so long ago outside the scope of medicine. Lady Wootton has a simple explanation for the widening of the scope of psychiatry. Moral problems have been incorporated into medicine "for no other reason than that doctors have decided to enlarge their empires so as to include territory formerly regarded as belonging to morality rather than to medicine, and so as to make a place for psychiatry in the medical curriculum". This statement shows a lack of historical insight which is most disturbing in one so eminent. Lady Wootton has not taken the trouble to find out why psychiatry is no longer confined to the 'insanities' but has become the study of abnormal behaviour. If she had given some time and thought to this problem, she would have learned that this change of the scope of psychiatry was due not only to psycho-analysis but also to the discoveries of the effects of brain lesions on behaviour.

Lady Wootton is alarmed about the vagueness of the concepts of psychopathy and mental deficiency. It is, of course, true that moral and medical judgments often overlap and are difficult to disentangle. There are still very few objective criteria of mental illness, and often the first and only indication of its presence is social failure. A considerable time may elapse in an individual case before other signs of illness can be demonstrated. All this is rather confusing, and sometimes the doctor, by introducing his own uncertainties, makes it difficult to administer the law; but this is an inevitable complication where knowledge is incomplete.

Lady Wootton is ultra-conservative concerning the safeguards against conviction for offences committed in a state of mental disorder. She does not think that the McNaghten rules, which reflect the medical knowledge of 1843, can be improved upon and she is opposed to the concept of diminished responsibility. She resents the 'privileged' position of the medical profession. It is a pity that Lady Wootton has not heeded her own warning that "in social research generally, constant vigilance is necessary against the risks of prejudice". Her attitude against the medical profession has a Shavian flavour, without being entertaining.

Lady Wootton condemns the emphasis on personal relationship in social work. The social worker ought to concern himself only with economic and not with personal difficulties, which, she believes, can be kept apart. The chapters dealing with the role of the social worker appear the most unenlightened of the whole book, probably because here the author speaks as an expert.

The concluding chapters make gloomy reading. Lady Wootton re-states her poor opinion of social pathology in its present immature state. Like everybody else, she wants more facts and more sophistication in the formulation of hypotheses. She believes that for some time to come the destruction of myths is going to be the chief pre-occupation of the social scientist.

It has been said that the main characteristic of the scientific attitude is the scientist's devotion to the detection of his own errors. Scientists must also undertake the task of proving others wrong. Lady Wootton has dedicated herself to the latter, but in doing so she has neglected the former, which is the true test of the scientific outlook. This is why this book gives a distorted picture of the state of social pathology. E. STENGEL

A DIVERSITY OF TRENDS IN MEDICINE

Ciba Foundation Symposium on Significant Trends in Medical Research

Edited by G. E. W. Wolstenholme, Cecilia O'Connor and Maeve O'Connor. (Tenth Anniversary Symposium.) Pp. xii+356. (London: J. and A. Churchill, Ltd., 1959.) 50*s*. net.

THIS account of the transactions of a special symposium arranged in June, 1959, to celebrate the tenth anniversary of the Ciba Foundation is the fiftieth major volume published for the Foundation. The aim in selecting the thirteen original papers, here printed together with the discussions on them, was to pick out the advances in medical research in the past ten-year period which would prove to be most significant in the next ten years. The speakers fortunately eschewed prophecy and talked about the work they were interested in personally. Distinguished as the participants were—they included seven Nobel laureates—it seems doubtful if any of them could have taken a sustained interest in everything that went on, or understood the whole of a terminology which included nuclear-spin and electron-spin magnetic resonance, genome, the ascending reticular system and co-arctation of the aorta. Few active scientists to-day are polymaths, and trends in medical research may diverge too widely to be the focus of a single gathering.

The Ciba Foundation has done such admirable work in providing hospitality for visiting scientists and arranging symposia of groups of experts that one must not grumble at an occasional *Festschrift* or express a perhaps purely personal prejudice against studying so many topics at once. Some of the subjects dealt with were general neurophysiology, hormones, pancreas and insulin, chronic pulmonary disease, clinical nutrition, and the organization of research in the United States. The remaining papers, which are concerned with such subjects as molecular structure in relation to biology and medicine, enzymes, the chemical basis of virus multiplication, population dynamics of body cells, genetics and medicine, malignant transformation, and the quantitative approach to disease as exemplified by essential hypertension, are a more homogeneous collection. They have in common the transmission of cellular characteristics, the disturbances which avoidably or unavoidably occur in this process, and the manifestations which these produce in the organism as a whole. The subject interests a wide range of workers, from electron microscopists to population research workers, and it will undoubtedly form a major trend in medical research in the next decade.

Pauling, Burnet and Medawar briefly indicated their own important contributions, discussing in particular the mechanism of antibody formation, and the question whether the relationship between stimulus and response should be described as 'instructive' or 'evocative'. Similar ideas were shown to underlie our notions of embryonic differentiation, ageing, and malignant disease. Waldenström (his Figs. 2 and 3 have unfortunately been transposed) emphasized the need for greater precision in the description and interpretation of inherited disease in man if human genetics is to support its theoretical superstructure, and Pickering reviewed his work on the incidence of hypertension and the quantitative approach to disease. Not all his audience agreed that the ability to arrange the blood pressures of a population in a normal frequency distribution curve tells us much about the etiology of essential hypertension. Moreover, it is doubtful whether many scientific clinicians to-day believe, as he suggests they do, that "a patient with a specific disease has a single basic fault". Indeed, I think the majority will be rather encouraged to learn that Waddington thinks the one-gene, one-enzyme hypothesis is an abstraction.

The book has been produced with remarkable speed, considering the inclusion of the discussions and the intervention of the printing strike, and it is a testimony to the experience and skill of the editors in this field.

L. J. WITTS

THE EYE AND VISION

The Eye in Evolution

By Sir Stewart Duke-Elder. (System of Ophthalmology, Vol. 1.) Pp. xvi+843 (902 figures)+15 plates. (London: Henry Kimpton, 1958.) 126*s*. net.

Documenta Ophthalmologica

Advances in Ophthalmology, Vol. 13. Edited by G. von Bahr, G. B. Bietti, J. ten Doesschate, H. Fischer-von Bünau, J. Francois, H. Goldmann, H. K. Muller, Jean Nordmann, A. J. Schaeffer and Arnold Sorsby. Pp. xii+516. (The Hague: Dr. W. Junk, 1959.) 75 guilders.

BOTH these books are directed towards ophthalmologists. One is written by a clinician, the other records the work and opinions of men many of whom are clinical ophthalmologists. It is significant that the material is largely made up of the basic sciences upon which ophthalmology is built.

Sir Stewart Duke-Elder explains why he has preferred to initiate the preparation of a "System of Ophthalmology", of which he will be editor, to the production of a second edition of his own comprehensive, internationally renowned and sought-after "Text Book of Ophthalmology". Much of the material in its seven volumes is now out of date and the earlier volumes out of print. But while this new book, written by Duke-Elder himself, is the first of fifteen planned volumes to cover ophthalmology it is an entity in itself which can be read and entirely enjoyed not only by clinicians but also by anyone interested in natural history, and in man. Its pattern is perhaps best shown by extracts from the epilogue and introduction in that order.

"This is the story of the development of the eye from the primitive undifferentiated protoplasm of the simplest protozoon to become the most highly efficient sensory mechanism in the animal kingdom in the eyes of Birds. It is the story of the development of the sense of vision from an autonomic response associated at some stage with a vague awareness, to the capacity to be enraptured by a rainbow or to create a thing of beauty".

"It is a fascinating story extending back to where life started, a story mostly of steady progress, now in this direction, now in that, as one expedient after another was tried, this one to be discarded, that to be perfected".

"We begin with a drop of viscid protoplasm the reactions of which we do not understand and we end lost in the delicacy of the structure of the eye and the intricacies of the ten thousand million cells of the human brain".

"If, indeed, the proper study of mankind is Man, and if (as we must agree) his behaviour and his contact with the outside world are mediated through his senses, what can be more fundamental than the study of the sense which, more than any other, determines his intelligence and regulates his conduct . . . ?"

To tell this story of the evolution of the eye and of vision through the animal world a vast amount of learning has been sought, assembled and arranged. It is presented in the same delightfully readable way that characterized the "Text Book of Ophthalmology". Not only is the reading easy, it seems easy to absorb the facts, and the lightness and grace of the writing tend to eliminate any text-book impression.

It is profusely and beautifully illustrated, and attractive marginal line drawings of many creatures have been added to supplement and enliven the text. The pleasant practice of opening a chapter with the photograph of, and notes about, an authority in the subject of that particular section has been carried on from the "Text Book". The layout and the production of this volume are excellent and clinicians at least will look forward eagerly to those which are planned to follow it.

Most of volume 13 of "Documenta Ophthalmologica" is given to the papers and discussion at a symposium on glaucoma held in Liège by invited participants from Europe and the United States. The papers are in English, French and German, and some of the mathematics and hydrodynamics will be beyond the ordinary ophthalmologist. But the reported work and the discussions which followed each paper provide a most interesting and instructive review of the research, basic and clinical, which in many centres is focused on aspects of the physiology and anatomy of the eye and the earliest evidences of an insidious disorder which accounts for much blindness, and which may well have its start earlier in life than has been generally thought. The last paper is an interesting, if abstruse, review of published ideas on frontal reference surfaces of binocular visual space commonly referred to as horopters.

R. C. Davenport

EARLY ETHOLOGY

Instinctive Behaviour

The Development of a Modern Concept. Translated and edited by Claire H. Schiller. Contributors: D. J. Kuenen, Konrad Lorenz, Nicholas Tinbergen, Paul H. Schiller, and Jakob von Uexkull. Pp. xix + 328. (London: Methuen and Co., Ltd., 1959.) 45*s*. net.

During the past twenty-five years very considerable progress has been made in the study of instinctive behaviour. This has been due largely to the work of Konrad Lorenz in Germany and Niko Tinbergen in Holland and England. They in turn owe some of their inspiration to a small number of earlier workers—Heinroth and von Uexkull, Whitman and Craig, J. Huxley and Eliot Howard. Their work has resulted in the development of ethology—a discipline characterized not by any strict boundaries to its subject-matter (indeed most ethologists are busy attempting to establish bridgeheads with related fields such as physiology, psychology, ecology and genetics), or by a formal theory, but rather by the orienting attitudes of its research workers. These attitudes reveal the influence of a zoological background, and include an interest in problems of the function and evolution of behaviour as well as its causation, an emphasis on the importance of the description and classification of behaviour as a preliminary to analysis, and an interest in comparative studies.

"Instinctive Behaviour" is a collection of some of the earlier ethological papers, translated into English by Claire H. Schiller. As such, it is not to be taken as representative of modern ethological views, but rather as showing the sources from which they developed. The first essay, first published by von Uexkull in 1934, is concerned with the relation between an animal's perception of its environment and its sensory capacities. This relationship is obvious enough now, but needed emphasizing at the time: the paper contains a number of interesting observations, as well as some rather far-fetched speculations.

The greater part of the book consists of six essays by Lorenz, Tinbergen and Kuenen, alone or in combination, including Lorenz's (1935) "Kumpan" paper and the classic papers on the egg-rolling of the greylag goose and the begging of young thrushes. The extent of Lorenz's and Tinbergen's genius is shown by the fact that many of the ideas which have proved useful in ethology were fully developed in these essays written twenty years ago. The use of fixed action patterns in comparative study, the evolution and function of social releasers, the nature of animal language, the integration of discrete actions into functional sequences of behaviour, and many other topics are discussed here in detail; and later workers on such subjects have had to do little more than fill in the details. At the same time, these papers contain much of the earlier theoretical background to ethology which is now discarded by most ethologists as well as by Lorenz and Tinbergen themselves. Lorenz's discussions of the innate/learning controversy, releasing mechanisms or the precise nature of 'action-specific energy' make curious reading now; though in their day they were fertile in provoking observation and experiment.

The last essay, by Lorenz, in this book (1952) contains a summary of Tinbergen's hierarchical scheme of nervous centres. This model embodied many of the earlier ethological ideas, and will probably come to mark the end of a phase in ethological thinking. Since then Lorenz and Tinbergen have developed new approaches and produced fresh ideas; but these are not represented in this book. In their later writings the distinction between the valuable general principles on which ethological work is based on one hand, and its earlier rather loose theoretical concepts on the other, becomes apparent.

This volume was planned and begun by the late Paul H. Schiller. It contains one previously unpublished essay by him on the importance of 'innate' organization in determining the course of learning in chimpanzees, in which he emphasizes that a knowledge of this organization is essential for analysing the acquisition of skills. This paper provides an example of the way in which ethology must develop—by inter-action with other fields of study in which ethological observations and methods can be applied.

R. A. Hinde

A NINETEENTH-CENTURY BOTANIST

Asa Gray, 1810–1888

By Prof. A. Hunter Dupree. Pp. x+505+9 plates. (Cambridge, Mass.: The Belknap Press of Harvard University Press; London: Oxford University Press, 1959.) 60*s*. net.

THE story of Asa Gray is told against a background of history concerned with the intellectual development of America during the nineteenth century. These pages should appeal not only to botanists, who know of its subject as one of the pioneers in the study of the geographical distribution of the American flora, but also to all those interested in the growth of the fruitful scientific collaboration between the New World and the Old in which Asa Gray played a notable part.

Born in 1810 of farming stock, Asa Gray was reared in the beautiful valley of Sanquoit and worked in the bark mill of his father's tannery. He was eighteen when plants caught up his interest, and he began to make a herbarium during his apprenticeship, for like so many of the earlier botanists he was educated as a medical practitioner. At the age of twenty-eight he was appointed professor of botany to the new University of Michigan and was enabled to visit Europe, which gave him the opportunity of forming the contacts with William and Joseph Hooker, George Bentham, Lyell and Charles Darwin that were to have a profound influence upon his subsequent career as an investigator.

While the author of this work emphasizes how Gray's scientific activities were chained to the results of American expansion and exploration, these nevertheless provided both the opportunities and the means. It was Asa Gray's good fortune to discover in the eastern States single representatives of Japanese genera previously regarded as monotypic, thus confirming his conclusions that while the European connexions are most marked on the side of the American continent nearer Europe, those with Asia are greatest on the remote side. It was these observations and his wide grasp of the North American floristics which attracted the attention of the Hookers and later of Darwin when he turned his attention to the botanical field.

From these pages we get the impression of their subject as a vigorous character, but quite incapable of estimating what he could, in fact, accomplish so that during his more active period 'the incomplete works of Asa Gray' continued to augment. It is an interesting sidelight on his personality that antagonism to the views of Agassiz would seem to have been an important stimulus, just as it was Alphonso Woods publications that appear to have provided the requisite catalyst for Gray to write his "Manual", that was his most important work, and which might otherwise never have been completed.

The Gray Herbarium was a vast collection that bore tribute to his drive; and the difficulties he had with the collectors, upon whom he relied for the new plants he described, are well portrayed as well as the impediments that these pioneer workers had to overcome in the tasks of identification.

The author of a biography may be forgiven a partiality for his subject and to such bias we may perhaps attribute the statement that Gray "shewed the qualities of mind and character necessary to rise to Darwin's level". But even though the reader may scruple to accept this assessment he cannot but be grateful to the author for this fully documented presentation of the man and his environment.

E. J. Salisbury

MASTER OF MICROBIOLOGY

Albert Jan Kluyver

His Life and Work: Biographical Memoranda, Selected Papers, Bibliography and Addenda. Edited by A. F. Kamp, J. W. M. La Rivière and W. Verhoeven. Pp. xv+567. (Amsterdam: North-Holland Publishing Co.: New York: Interscience Publishers, Inc., 1959.) 80*s*.

THIS book contains a record of the life and work of a great microbiologist—perhaps the last we shall see of those encyclopædic men whose field was the study of micro-organisms as a whole. Micro-organisms have an increasing role in human activities: as agents of soil fertility and in the production of prophylactic, therapeutic and other economically important materials, and as agents in animal and plant diseases and in the spoilage of stored products. The utilization and control of micro-organisms will be increasingly important as populations grow, with their increasing demand for food and for the prevention of disease. Applied physics may steal the headlines for a while, but when all is said, the problems of food production and of health will remain, and in these micro-organisms must play an important part. The concepts of the 'unity of biochemistry' and of 'comparative biochemistry' which Kluyver enunciated so clearly are cardinal in modern biological studies. Micro-organisms multiply quickly and we now know that it is often possible by studying them to gain information of general biological importance more easily and rapidly than by studying more complex organisms. Kluyver's work in microbiology is an example *par excellence* of that interweaving of biochemistry and biology which is now proving so fruitful in biological studies. The line of Dutch microbiologists such as Leeuwenhoek, Beijerinck and Kluyver forms one of the great arteries of microbiology; this school has been particularly concerned with fundamental studies of microbial physiology. Another equally important line comes, of course, from the Pasteur school, which developed particularly the study of disease-producing organisms and the prevention of their effects. Both lines of development lead, in the end, to study of the biochemistry of the modes of action of specific micro-organisms. An important feature of the work of the Dutch school has always been the study of micro-organisms in general, of what they do and how they do it: general microbial physiology.

The book is divided into three parts; most of it is in English.

Part 1. Biographical memoranda. This begins (pp. 3–67; illustrated by 23 photographs) by giving the outline of Kluyver's life, with a very interesting section about Kluyver as seen by his pupils. There follows (pp. 68–155) a masterly survey by C. B. van Niel of Kluyver's contribution to microbiology and biochemistry. This part closes with two moving funeral orations.

Part 2. Selected papers (pp. 165–524). The papers selected are, with two exceptions, those of which Kluyver was the sole author. They are mainly the general articles and lectures in which he displayed his masterly grasp of, and wide-ranging thinking about, microbial physiology, and are written in his characteristically vivid personal style. In these writings Kluyver established himself as a great thinker and teacher about microbiology: the experimenter who related his findings to the advance of his field of science as a whole. Every one of these papers should be read and digested by anyone who is concerned with the future trends of microbiological science and its mode of progress.

Part 3. Bibliography and addenda (pp. 527–563). This contains detailed lists of joint papers by Kluyver and co-workers, of doctoral theses supervised by him, of papers from the laboratories at Delft and Utrecht which he influenced; lists also of the members of the staff at Delft during Kluyver's directorship, of the many honours conferred upon him, and of obituary articles. This simple documentation of his work and influence strikingly illustrates his energy and breadth of interests.

Kluyver was a splendid man and a splendid scientist of the kind most fitted to this epoch. He was never content only to deepen his studies of micro-organisms, but was always conscious of, and able to explain clearly, the relations of the work of his school to the advance of microbiology as a whole. His work and influence continue to shape that science. What better memorial could a man wish than that people will return again and again to his writings to seek refreshment and inspiration. This beautiful volume should be possessed by every university library and every department of biological science.

B. C. J. G. KNIGHT

DIAGNOSIS OF HUMAN GROWTH

Growth Diagnosis

Selected Methods for Interpreting and Predicting Physical Development from One Year to Maturity. By Leona M. Bayer and Nancy Bayley. Pp. xiv + 241. (Chicago: University of Chicago Press; London: Cambridge University Press, 1959.) 10 dollars; 80s. net.

PHYSICIANS concerned with the treatment of children and adolescents will be glad to see a book which provides them with a set of blue-prints for assessing growth. In a number of research centres, and particularly in the United States, the individual progress of hundreds of boys and girls has been documented from birth to maturity. Based on these studies, the details of growth have been precisely delineated to show increases in individual parameters and changes in proportions as well as in certain more superficial and subtle aspects of body covering and contour.

Since deviations in growth pattern may reflect corresponding physiological abnormalities, accurate recognition of deviations can be an important diagnostic aid. An exact description of the morphological and temporal aspects of a growth deviation may thus provide a reliable guide to its probable ætiology.

Before establishing deviations, however, it is necessary to define norms, and this the authors do by selecting examples from a population which is ethnically homogeneous, clearly described and numerically adequate; the norms can also be statistically defined. These anthropometric norms have been derived mainly from American children of European origin who have been nurtured under favourable conditions; in most cases they have been expressed in means and standard deviations.

The great value of this book is that it is very practical. Elaborations of anthropometric measures and indices are limited to five each, and have been chosen for their simplicity and for their usefulness over the whole span of childhood and adolescence and for their special relevance to sexual differentiations. Most physicians wishing to make use of the extensive lists of charts and tables should be prepared to take three measurements in addition to the conventional heights and weights.

Although a different presentation might have been required, it is unfortunate that Prof. Bayer and Dr. Bayley have not rounded off such an eminently useful work by the inclusion of relevant information for babies up to the age of one. This is the age-group which commands greatest interest and which could act as a starting point whereby British physicians might take a greater interest in the subject of growth diagnosis.

This book would be appreciated by members of school medical services, maternity and child welfare officers, general practitioners, Service and industrial medical officers, and all students of human biology who are interested in promoting the positive health of children and teenagers.

K. M. HAWKINS

RED, ROE AND FALLOW

Wild Deer

By A. J. de Nahlik. Pp. 240 + 26 plates. (London: Faber and Faber, Ltd., 1959.) 70s. net.

IN the past five or six years there has been a great increase in interest in the wild deer of Britain, both by naturalists and by sportsmen. The Deer Group of the Mammal Society of the British Isles focuses the naturalists' interest and the St. Hubert Club the sporting interest. Squadron-Leader de Nahlik is a member of both, and his book links the two interests, but leaning rather on the sporting side.

He confines himself to three species out of the five or six that are at present running wild in British woods, namely, the native red and roe deer and the probably introduced fallow. The three aliens which he ignores are the widespread sika, the locally common (in the Midlands) muntjac or barking deer, and the much more local Chinese water deer. The book is the fruit of many years field experience of deer, both in Britain and on the Continent, and no doubt the reason that the sika and muntjac are omitted is because the author has not wished to write about animals of which he has no personal experience.

Into the natural history of the red, roe and fallow the author goes reasonably fully, dealing especially with their annual breeding cycle, antlers and how to recognize them at various stages of their development. He tackles next the problem of damage by deer to farming and forestry, and the various methods of control, including the use of chemical repellents. These last have been much more fully investigated on the Continent than in Britain, and it is most useful to have a full list of them, their uses and manufacturers, for the first time in any book on British deer. Other chapters discuss the various niceties of deer shooting and stalking, and so are of less interest to the naturalist, except in so far as the management of a deer forest needs to be done scientifically. However, even naturalists enjoy venison, so the appendix of various ways of cooking this delicacy will doubtless have a wide appeal. There is also a valuable glossary at the end, in which not only are such technical terms as 'beam', 'gralloch', 'tine' and 'trey' explained, but also their equivalents are given in five European languages: German, French, Spanish, Italian and Polish. The book is well illustrated with black-and-white photographs and there are some thirty diagrams in the text.

R. S. R. FITTER

THE ARADIDAE

Classification of the Aradidae (*Hemiptera-Heteroptera*)

By Robert L. Usinger and Ryuichi Matsuda. Pp. vii+410. (London: British Museum (Natural History), 1959.) 80*s*.

THE Aradidae are a small family of mycetophilous bugs mostly occurring on or in wood of forest trees. Before the appearance of this book they comprised some 64 genera and 685 species, and had not been comprehensively studied since the time of Stål. As Prof. Usinger points out, accident and mischance held back taxonomic advances in this group; but the dispositions made in the present work result so extensively from the study of new material that it would seem unlikely that they would have been anticipated had earlier work been completed on the basis of existing collections.

The arrangement is logical and the presentation easy to comprehend. At the beginning, 28 pages, illustrated with 20 figures and two plates, are devoted to morphology, and facilitate interpretation of the descriptive text. This section is furnished with a separate bibliography. Seven pages are devoted to the biology of Aradidae, and as most of these are occupied by a long table of plant associates, it is evident that almost everything has yet to be learned about the preferences of species for their fungal substrates. Nevertheless this section is tersely written, and conveys a substantial amount of information. Geographical distribution is treated in the eight pages which follow, in which a tabular synopsis of generic distribution between seven zoogeographical areas is followed by a discussion of salient points. The reader will find it necessary to seek amplification of the data in the descriptive part of the text, especially with regard to the genera pigeon-holed in the 'Neotropical' column.

The classification itself occupies 326 pages, and (to quote Prof. Usinger) "is, in effect, a generic classification . . . with new species described only when necessary to validate new generic names or when desirable to elucidate little-known groups". The new matter comprises two subfamilies, fifty-nine genera and about eighty-two species, and almost doubles the number of genera hitherto known, and increases the number of species by nearly 12 per cent.

In Aradidae, as elsewhere, it is not easy to recognize close relationship through common ancestry as opposed to parallel evolution, and the authors have judiciously used zoogeographical data as a criterion of natural relationship. This serves to throw into prominence the anomalous cases which remain, such as the distribution of species of *Ctenoneurus* (Australasia and West Africa). Lists of species are provided after each genus, and sometimes keys, but "only where they are up-to-date or complete on the basis of work done by the senior author in European Museums in 1948–49". The descriptions are uniform and exhaustive; but the bizarre contours of an aradid give especial point to the dictum that a drawing, however crude, is better than a torrent of the most carefully selected adjectives, and the authors have percipiently illuminated the text with superb line illustrations. In large part their inclusion was made possible by a grant from the Trustees of the British Museum, and readers will applaud their action. The book is completed with a bibliography of eighteen pages and an index to all taxonomic categories in the family.

R. G. FENNAH

PARASITES, IMAGINARY AND REAL

Parasites and Parasitic Infections in Early Medicine and Science

By Prof. R. Hoeppli. Pp. xiv+526+23 plates. (Singapore: University of Malaya Press; London: Oxford University Press, 1959.) 25 Malayan dollars; 63*s*. net.

REINHARD HOEPPLI is known to parasitologists as the author of many papers on helminthic and other parasites and various aspects of parasitism. His work during the past forty years has been concerned with experimental parasitology and pathology as well as morphology and taxonomy, but sometimes he has written, with or without collaborators, on ancient knowledge in this field. Such papers on the history of his subject have appeared more often during the past ten years and they seem to have formed the basis of this meticulous book, which is divided unequally into three parts.

Part 1 (11 chapters and 269 pages) deals with the earliest period up to the middle of the seventeenth century, covering such topics as the knowledge of parasites, clinical symptoms, imaginary and false parasites, the doctrine of spontaneous generation, therapeutic and cosmetic uses to which parasites have been put and the treatment and prevention of infection.

Part 2 (12 chapters and 198 pages) concerns special parasitological subjects of historical interest such as malaria, dysentery, leeches and scabies in Chinese medicine, some early views shared by the people of Borneo, Malaya and China, and ancient opinions held by the indigenous populations of Fiji and Tahiti. One chapter discusses exchange of ideas concerning infections, and it may well indicate some of the ways in which parasites themselves were spread.

Part 3 is a very short outline of 16 pages concerned with the increase in knowledge of parasites from the middle of the seventeenth century to the middle of the nineteenth, and this contains so many names of parasites and persons that other readers may also wish that the author had amplified this portion of his text. The book ends with a short conclusion, an appendix of 8 pages on the role of parasitic diseases in history, a subject index, an index of names, and 23 plates illustrating ancient conceptions of parasites, imaginary parasites, magic treatment and various kinds of indigenous medical treatment in Sarawak.

The author's aim has been "to give a picture of early parasitology by showing the actual knowledge of parasites and parasitic infections of the time together with prevailing ideas, common beliefs and errors formerly connected with parasites".

The book is largely anecdotal and discursive, and the author has given many quotations from early Chinese, Greek, Roman, Italian, French and German authors, together with translations of them. Much ancient lore about fears and superstitions, materia medica and whimsical forms of treatment is displayed, and it ranges from the horrific to the mildly amusing.

Imaginary parasites included the corpse worm, supposedly undergoing six transformations before finally appropriating the soul and leaving the patient's body to infect a close relative with the wasting disease phthisis. Another was the echoing worm, which produced an abdominal echo whenever the patient spoke. One patient read the herbal "Pen Ts'ao" as far as the description of Lan (indigo plant), when the echo subsided. He then took some juice of Lan and was sick, and the echo was heard no more! Another patient read on as far as thunder pills, took some of these, and likewise cured himself. Silence was essential during the preparation of the medicine, because the parasite would refuse to emerge should it hear any word about the drug to be used.

The reader is also reminded that pseudo-parasites flourished long after the compound microscope was pressed into service. For two centuries spermatozoa were regarded as Infusoria, and von Baer considered them to be a kind of cercaria. The doctrine of spontaneous generation is considered in its application to parasites and the possible origin of parasites as inborn entities is also reviewed. The Preformationist Vallisnieri believed that all future helminths, as well as all future human beings, were contained in the ovaries of Eve!

As reading proceeds, however, the impression lingers that this is not so much a book as a somewhat restricted and disjointed collection of papers. Indeed, 12 chapters of Parts 1 and 2 are based on previously published papers, although this is indicated only by footnotes. Some chapters are scarcely worthy of the name, because they are short topics which would scarcely be missed if deleted. Chapters 6, 7 and 8 in Part 1 and Chapter *G* in Part 2 are examples. The book contains much that is not strictly parasitological, for example, Chapter *K*, Part 2, which deals with the role of the Moon in biology and medicine. In only the short third section (3 pages of notes) are parasites mentioned, and the chapter ends with the conclusion that "no such (supposed) influence has ever been proved", reported cases falling down under "scientific criticism" or being "pure superstition".

Yet, Prof. Hoeppli's book deserves to be widely read by parasitologists, as no doubt it will be, though its theme fosters the view that there is something horrific about parasites, which work towards the discomfiture and often the destruction and death of their hosts. This may well be true of many of the parasites of man and domesticated animals, but it is an inaccurate conception of parasitism. The book does show that many errors of judgment have gone in procession down the ages, which may have a salutary effect on parasitologists who accept over-readily what has passed before as irrefutable truth. In such a way, this book may act as a spur to further research.

BEN DAWES

PROGRESS IN PLANT PATHOLOGY

Plant Pathology

Problems and Progress, 1908–1958. Edited by C. S. Holton, G. W. Fischer, R. W. Fulton, Helen Hart, and S. E. A. McCallan. Pp. xix+588. (Madison, Wisconsin: University of Wisconsin Press, 1959. Published for the American Phytopathological Society.) 8.50 dollars.

Plant Pathology

An Advanced Treatise. Edited by J. G. Horsfall and A. E. Dimond. Vol. 1: The Diseased Plant. Pp. xiv+674. (New York: Academic Press, Inc.; London: Academic Press, Inc. (London), Ltd., 1959.) 22 dollars.

In design and purpose these two books are very different but each reflects the progress in plant pathology that has taken place during the present century, and each is the result of an international effort to present an accurate picture of the stage reached. One is the published record of the 1958 golden jubilee meeting of the American Phytopathological Society, which took the form of a series of seven major reviews and nine academic symposia chosen to cover all the important facets of plant pathology. The meeting and the book were carefully planned in advance, with the written part subject to certain manuscript specifications that controlled the form but not the content of the contributions. The other was designed to present an integrated synthesis of the parts of plant pathology for the advanced student. Its framework was constructed with enthusiasm by two distinguished editors with unconventional ideas, who have left their impress in greater or less degree on the content as well as on the form of the contributions. The jubilee volume is self-contained, and is essentially a record, if a selective one, of research carried out: the treatise, with a text about two-thirds the length of the other and decidedly more expensive, is only the first of three volumes which together are intended to provide a comprehensive theoretical treatment of plant pathology.

The first part of the jubilee volume is devoted to addresses given by Prof. E. C. Stakman and six other American plant pathologists of international standing. They review the status and role of plant pathology in the scientific and social development of the world, its growth in North America and the part played by the American Phytopathological Society, as well as certain landmarks in control of disease through host resistance and by the use of chemicals. The symposia, which make up the rest of the book, cover such diverse topics as the physiology of parasitism, the genetic mechanisms governing pathogenicity and disease resistance, soil fungi, the structure and multiplication of viruses, epidemiology, fungicides, and the concepts and problems of nematology. It is only meet and right that most of the contributions should issue from North America, but there are eleven from Britain, including five from Rothamsted, together with a few from Australia, South Africa, Germany and the Netherlands. The inclusion of a section on nematology in a work on plant pathology is no longer the surprise it was to the British plant pathologist, who is likely to find heavier going in the plant virus section, though once again F. C. Bawden displays his great skill in lucid presentation. The history of the American Phytopathological Society and of its journal *Phytopathology* makes interesting reading. The Society, which began with a subscription of 50 cents and 130 charter members, is now nearly 2,000 strong. Its originator, C. L. Shear, was the first secretary-treasurer and L. R. Jones the first president. The book is very good value for money.

In the "Treatise" the diseased plant is the important object and the pathogen takes second place. Indeed, it is relegated to a second volume which will focus attention on the pathogen, on techniques inhibiting it, and on pathogenicity, while the third volume will cover the public health aspects of the subject, including disease epidemics and their control. In this first volume there are a few introductory chapters on the history of plant pathology, its relationship to other scientific disciplines, and losses caused by disease, but the text is largely devoted to the suffering plant, to pathological processes, defence mechanisms, predisposition and therapy. As the editors make clear in their prologue the main theme revolves round the pathological processes, and it is on these processes that diseases must be classified. Thus we read about tissue being disintegrated instead of about necrosis; about growth being affected rather than morbid anatomy; and about water deficiencies rather than wilts; but the result is not always very different from what one is used to. The general standard of the text is high, though rather diffuse in places. Nearly half of it was written in the United States, but there are five contributions from Europe and Asia, with the promise of substantial British participation in the two volumes still to be published.

W. C. Moore

MYCORRHIZA

The Biology of Mycorrhiza

By Dr. J. L. Harley. (Plant Science Monographs.) Pp. xiv+234+11 plates. (London: Leonard Hill (Books), Ltd., 1959.) 55*s*. net.

THIS publication is an important event in the progress of research on mycorrhiza. Dr. Harley provides us with a clear account of what is known in this field (hitherto notorious for its confusion) and shows also where the considerable gaps in our knowledge lie. It will be surprising and disappointing if this stimulating monograph does not benefit both the quantity and quality of future research on mycorrhiza.

It is about eighty years since Frank first noted the widespread association of root and fungus which he termed 'mycorrhiza'. Since then a great deal of work and thought has been given to these organisms, but perhaps without commensurate increase in understanding. Difficulties are obvious: the structures are hidden in the soil; the small scale, especially of some of the fungus partners, hinders anatomical study; culture of one partner without the other is often difficult or impossible; and certain appropriate techniques have only recently become available. Apart from such technical difficulties, this complex subject seems to have attracted an excess of sterile hypothesis and slipshod thought.

It is the virtue of Dr. Harley's monograph that it carefully points out these areas of imperfect experimentation and thought (and language: the index includes "Thamniscophysalidophagy, term not used on page 195"). Having done so, it avoids further treatment of these aspects, and concentrates on the firmer ground, incidentally revealing outstanding problems where research may most usefully be applied. In several fields Dr. Harley has been able to develop arguments that enhance our appreciation of the significance of mycorrhizal phenomena; for example: (1) he has pointed out that all roots growing in soil are inevitably surrounded by and interacting with special local populations of micro-organisms, and that the mycorrhiza is a special case of this general relationship; (2) studies made by Dr. Harley and his students using labelled phosphate and excised beech mycorrhizas enable him to outline the general mechanism by which ions are actively absorbed and accumulated by the fungal sheath and afterwards transferred to the root; (3) by stating the evidence for and against nitrogen fixation by the fungi of ericoid and orchid mycorrhizas, he makes it clear that the widespread acceptance of the hypothesis that these organs fix nitrogen is unjustified.

The literature of mycorrhizas is scattered, since it enters the fields of plant physiology and anatomy, mycology, forestry, and soil science. Some of the publications are not easily available, and a number are in languages that most workers cannot read. Consequently the collection of recently published material in this monograph will be particularly useful to those embarking on research. For students, too, this book is bound to be valuable, though it would have been more attractive and useful to them if the plentiful illustrations promised by the publishers were in fact present. The only anatomical figures are a transverse section and partial longitudinal section of beech mycorrhizas, and three figures of aseptate hyphæ and vesicles. This deficiency is only partially alleviated by some plates.

The mycorrhizal condition is not merely an absorbing problem for academic research. It is a condition that is "at least as usual amongst the seed plants as the uninfected state"; and phycomycetous mycorrhiza, of which astonishingly little is known, occur in many important crop plants—date-palms, cocoa, tea, coffee, legumes, cereals, and grasses. If the symbiosis is highly integrated it may be satisfactory, for ecological and agronomic purposes, to treat the dual organism as a single unit; but it is not certain that integration is as complete as this. For applied purposes, therefore, as well as in its own right, mycorrhizal research is needed; and for such research this excellent book will be a stimulus and guide.

J. Warren Wilson

THE BANANA

Bananas

By N. W. Simmonds. (Tropical Agriculture Series.) Pp. xvi+466+93 photographs. (London: Longmans, Green and Co., Ltd., 1959.) 45*s*. net.

A VAST amount is now known, and has been written, about many of the major crops. When that crop is an exotic one like the banana, cultivated virtually throughout the tropical belt and also in many sub-tropical regions as a prime source of food and other commodities, then we have indeed an unusually rich and varied subject for the scientific writer, especially if his interests are liberal. Bananas, in their considerable variety and diversity, afford interesting materials not only for the professional botanist and agriculturist but also for those who concern themselves with the early history of man and his migrations. In some parts of the world bananas are, of course, very big business. An adequate account of all these aspects, and many others, is now available in the up-to-date book prepared by Mr. N. W. Simmonds, formerly senior cytogeneticist at the Imperial College of Tropical Agriculture, Trinidad.

The book contains chapters on the general botany, morphology, anatomy, composition, and systematic position of species of the genus *Musa*. Other chapters deal in a very thorough manner with the classification and nomenclature of wild and cultivated varieties, and with the cytology, genetics and breeding of commercially useful hybrids. These constitute the most important scientific parts of the book, including as they do much of the author's personal contribution. There are also accounts of the agricultural management of the crop, its major diseases and pests, and the handling and ripening of the final product—the bunch and individual fruits. Of course, the banana is a very remarkable plant and the general reader will almost certainly derive both pleasure and interest from the chapters dealing with the history of the industry and the uses to which the fruit can be put; for bananas can not only be eaten as dessert fruits: they can be cooked in various (?) attractive ways, made into sweets and powder (flour), dried into 'chips' and 'figs', brewed into beer, and so on. Such a commodity could scarcely fail to have many medico-magical uses. The book is handsomely illustrated by plain and coloured photographs and line drawings, while certain general phenomena are depicted by means of ingenious diagrams.

By his novel and attractive treatment of this major tropical plant, Mr. Simmonds has contributed an important work of scholarship, rich in its botanical and scientific content; and because of its directness and lucidity, it may well have a more general appeal.

The book will certainly be read with appreciation by members of the planting community and by research workers. Indeed, in my opinion, no book on the banana of equal status and content has hitherto been published. C. W. Wardlaw

TROPICAL ANIMAL HUSBANDRY

An Introduction to Animal Husbandry in the Tropics

By G. Williamson and Dr. W. J. A. Payne. (Tropical Agriculture Series.) Pp. xix+435+48 plates. (London: Longmans, Green and Co., Ltd., 1959.) 48*s*. net.

THIS is a book with a large number of facets. While written for the animal husbandman in the tropics, for whom it will be invaluable, it incidentally gives much information of physiological, zoological, nutritional and sociological interest.

The earlier chapters are devoted to scientific information on conditions in the tropics—a description of climates and the direct effects of them on the animal through solar radiation, temperature, humidity and daylight hours, as well as the indirect effects through feed supply. Prevalent infections and insect-transmitted diseases with remedial measures are described. Nutrition is approached from a wider angle than is to be found in the usual text-book. Prominence is given to things such as water supply—the number of days different species can do without it and the amount they drink. Types and nutritional value of vegetation to be found under different climatic conditions are described. The rapid growth and seeding of plants in the tropics and the longer growing period in many areas which lead to practices such as burning and standing hay are discussed and better methods suggested.

In the chapters devoted to husbandry some typical tropical breeds in each species are described. The whole range of husbandry practices from the very primitive to modern methods is detailed—from the kraaled cattle at night in Africa, where short-day grazing limits production, to the modern methods adopted by the Aarey Milk Colony in Bombay; and from the primitive fermentation method of hatching hens eggs to the use of the modern incubator. Comparisons of production in temperate as compared with tropical zones are also given. While in Western Europe 660 lb. of milk are produced per capita of the human population, Africa only produces 46 lb.; again, there are five times as many sheep, only half as many goats and twice as many pigs in the temperate as compared with the tropical zones.

Of particular interest are the chapters written by experts on special subjects. The buffalo produces most of the milk consumed in India and Egypt in spite of the fact that its heat-regulating powers are not so good as those of the zebu. Camels produce a calf only every other year and the period of rut in the male, induced by lengthening days, lasts only for a period of about three months; if deprived of water they can drink up to 20 gallons at a time, an amount which would result in water intoxication in other species. An account of the African nomad, the circumstances which cause his mode of life and ways in which he could be settled are also outlined.

Throughout the book references are given to the more important original papers dealing with livestock production in the tropics. John Hammond

ORGANIZATION, CONTROL AND SYNTHESIS IN MICRO-ORGANISMS

Annual Review of Microbiology

Vol. 13. Edited by Charles E. Clifton, in association with Sidney Raffel and Mortimer P. Starr. Pp. viii+553. (Palo Alto, Calif.: Annual Reviews, Inc., 1959.) 7 dollars.

THE past two decades have seen the transformation of microbiology from an 'applied science' to a subject which is making fundamental contributions to many and varied fields of biological research. As the ever-increasing mass of publications so amply testifies, it is a subject still in its logarithmic phase of growth and thus the demand for concise and critical surveys of recent advances becomes greater year by year; for the past twelve years "Annual Reviews of Microbiology" have met this demand. The thirteenth volume in this series will disappoint no one; it contains twenty-one articles which cover aspects of microbiology ranging from the biosynthesis of macromolecules to the intriguing subject of 'unicellular clocks'.

Microbiological research in recent years has been dominated by the problems of biosynthesis, intracellular organization and mechanisms of biological control; one third of the contributions in this volume are concerned with these questions. Roberts, McQuillen and Roberts, in an article entitled "Biosynthetic Aspects of Metabolism" present an admirable account of current views on the synthesis of protein, ribonucleic and deoxyribonucleic acids. They discuss recent advances under four headings: first, those made by using purified enzyme preparations, second, reactions which are observed with cellular fragments, third, reactions of intact cells, and finally, the effect of various inhibitors and certain biological or physical disturbances on biosynthetic reactions. A more specialized aspect of the biosynthesis of macromolecules, the synthesis of antibodies, is discussed in an article by Bussard.

Genetic control of biosynthesis forms the subject-matter of two reviews. The first, by Demerec and Hartman, surveys knowledge of the complex structure and chromosomal arrangement of gene loci concerned with sequential steps in biosynthesis. In the second, Hartman and Goodgal deal with the transfer of genetic material in bacteria, mediated either by cellular contact, free deoxyribonucleic acid or bacteriophage. The genetics of bacteriophage are discussed in a separate contribution by Bresch. Another aspect of biological control is presented by Hastings under the heading of "Unicellular Clocks", in which he discusses the persistent diurnal rhythms which influence phototaxis, luminescence, sexual activity and cell division in certain flagellates and ciliates.

Ultimately, the biochemists' concepts of synthetic mechanisms and the geneticists' views of controlling mechanisms must be correlated with the cytologists' interpretation of intracellular organization. Clearly much remains to be discovered before such a correlation can be completed; however, Mitchell has attempted to fit together many of the available pieces of the 'jig-saw puzzle' under the title "Biochemical Cytology": this is a most stimulating contribution.

Catabolic aspects of metabolism surveyed include: fermentative metabolism (Rabinowitz), sulphate reduction by bacteria (Postgate) and aspects of terminal respiration in micro-organisms (H. L. Kornberg). This latter review provides a valuable survey of evidence for the occurrence of the tricarboxylic acid cycle in micro-organisms and indicates some of the difficulties and pitfalls encountered in the study of microbial oxidative processes.

Other topics reviewed include: plant diseases (three articles); new antibiotics and the use of antibiotics in food preservation; the biology of Tetrahymena; the physiology and development of Phycomycetes; non-specific resistance to infections in animals; immunological tolerance; new viruses; microbiological aspects of tissue culture.

There can be no doubt that this volume will be of value to all who observe the devious ways of micro-organisms. The editors are to be congratulated for selecting such a wide and interesting range of topics and the reviewers for their courage and skill in attacking, sorting and surveying such a formidable mass of data. B. A. NEWTON

BIOCHEMICAL DATA

Data for Biochemical Research

Edited by R. M. C. Dawson, Daphne C. Elliott, W. H. Elliott and K. M. Jones. Pp. xiii+299. (Oxford: Clarendon Press; London: Oxford University Press, 1959.) 63*s*. net.

SCIENTISTS owe much to the patient endeavours of authors and editors of reference works such as "The Handbook of Chemistry and Physics", "Documenta Geigy Scientific Tables" and the "Merck Index". In the present book information which is of particular interest to biochemists has been collated.

The subject-matter is sub-divided into fifteen sections, namely: table of biochemical compounds; enzymes commonly used as laboratory reagents; buffers and physiological media; methods for the detection of biochemical compounds on paper; the properties of some ion-exchange resins; isotopic data; manometry; nomograms for manometer constants; ammonium sulphate solutions; miscellaneous reagents, tests and recipes; acid-base indicators; table of normalities; autoclaves: temperature-pressure conversion table; miscellaneous formulæ; international atomic weights, 1955.

More than half the book is devoted to the first section, which tabulates various features and properties (structural formula, molecular weight, solubility, optical rotation, etc.) of about one thousand compounds of biochemical interest. The compounds are arranged in nineteen different groups, beginning with amino-acids, peptides and related nitrogenous compounds and ending with macromolecules. The type of information provided varies according to the particular needs of the group. Thus, spectral data are provided for porphyrins and related compounds but not for lipids and fatty acids. Wherever possible, general group references and references to methods of preparation and estimation are given and a column of general remarks provides additional useful information.

The chief merits of the book appear to lie in the first section and that on methods for the detection of biochemical compounds on paper. In the latter section the compounds are grouped appropriately, numerous references are given and the information is presented in a readily accessible form. Some of the remaining sections are of less-certain value and material sometimes appears to have been selected in an arbitrary manner.

The editors have wisely stated that the book is not intended to be an exhaustive work of reference and, indeed, many readers will be disappointed that their own particular interests are not catered for. In spite of the editorial proviso it is surprising, for example, that such well-known compounds as fibrinogen, chitin, hyaluronic acid and chondroitin sulphates *A*, *B* and *C* are not listed under 'Macromolecules' in the first section. The important phosphato-sulphate nucleotides, discovered in 1956 by Lipmann's group, are not listed with other nucleotides or, indeed, anywhere in the book. The section on properties of some ion-exchange resins could surely have been extended to provide information on the important cellulose ion-exchangers.

Several authors have contributed to the book and it is perhaps not surprising that some inconsistencies appear. Thus in the first section, under "Carbohydrates and Related Compounds", the Haworth ring-form is used to formulate the compounds. In contrast, under "Phosphate Esters, including Nucleotides", the less appropriate Fischer-Tollens ring structure is generally used. Hydroxymaleic and hydroxyfumaric acids are correctly formulated in *cis* and *trans* forms respectively. The unsubstituted acids, however, are given identical structures.

As a complete reference work for biochemists the book has obvious limitations. However, as an adjunct to the works mentioned in the opening paragraph of this review, the book will undoubtedly be of value to most biochemical laboratories.

K. S. DODGSON

GENERAL BIOCHEMISTRY

Traité de Biochimie Générale

Par M. Javillier, M. Polonovski, M. Florkin, P. Boulanger, M. Lemoigne, J. Roche et R. Wurmser. Tome 1: Composition Chimique des Organismes. Premier Fascicule: Pp. iv+1–706. Deuxième Fascicule: Pp. iv+707–1475. (Paris: Masson et Cie., 1959.) Broché 22,000 francs; Cartonné toile 24,500 francs les deux volumes.

THE undertaking of a five-part treatise on general biochemistry is a formidable enterprise. The rapidity with which the subject is developing at the present time sometimes induces in potential authors of books on it a continued temptation to procrastinate. Their answer to a suggestion that they might write a book often follows this sort of pattern: "The subject, particularly those parts of it in which I am most closely concerned", they say, "is so rapidly advancing at the present time that no general review of it is worth while recording in a book" . . . "But in one year's time, perhaps two, the air should have cleared and I shall be able to write an account which is much more satisfactory than anything that can be produced to-day". It is always to-morrow that there will be jam for tea; never to-day.

Fortunately, not all are so faint-hearted or cautious. It is perhaps natural that, in the language of the country which bred the first modern encyclopædists, a group of distinguished French-speaking biochemists, most from France itself, should have decided to undertake the task of imprisoning within the limits of a few thousand pages the essentials of a subject which, perhaps more than any other, resembles Proteus in modern guise.

The Board of Editors consisted of Profs. M. Javillier, M. Polonovski, M. Florkin, P. Boulanger, M. Lemoigne, J. Roche and R. Wurmser, with P. Boulanger and J. Polonovski acting as secretaries. Although Prof. M. Polonovski was killed in a road accident soon after the plans had been agreed, and M. Javillier also died before the completion of the work, the remaining editors decided to continue along the agreed lines, and the first section, in two parts, is now published. The complete work will fill three tomes, totalling five parts altogether.

The two parts of the first section are devoted to a survey of the chemical composition of living matter. Introductory chapters deal with the elementary composition of organisms and their mineral constituents, and then follow chapters on carbohydrates, lipids, in which are included sterols, steroids, carotenoids, terpenes and terpenoids, and on organic acids and phenols. Some of Part 1 and most of Part 2 are taken up with treatises on amino-acids, peptides and proteins. A section on substances attached to proteins includes a useful review of alkaloids. Part 2 concludes with a discussion of the associations formed between the substances dealt with, for example, lipid-protein complexes, antigen-antibody and enzyme-substrate complex formation, and a brief discussion of the borders of biochemistry with respect to organization and morphology.

The editors and authors aim to present the principles of biochemistry which in their view are essential for students of chemistry and physiology, pharmacy and medicine, agriculture and technology. How far such an aim has been achieved will be clear from the completed work; but on the basis of the first two parts it can be said that no reason has yet emerged why the authors should not succeed in their ambitious enterprise.

F. G. YOUNG

ANTIGENS, TRANSPLANTATION AND TOLERANCE

Biological Problems of Grafting

A Symposium sponsored by the Commission Administrative du Patrimoine Universitaire de Liège and the Council for International Organizations of Medical Sciences. Pp. xii+453. (Oxford: Blackwell Scientific Publications, 1959.) 50*s*. net.

A SYMPOSIUM on the biological problems of grafting was held in Liège during March 18–21, 1959, under the chairmanship of Prof. P. B. Medawar. The number of participants was limited and most of them presented papers which, together with the relevant discussions, are now published in full. A total of twenty-nine papers was given, ranging over most of the current controversial problems in transplantation. These include the identification of the transplantation antigens, the investigation of the mechanism of the homograft reaction, the means by which tolerance may be induced and its attendant difficulties of the runt syndrome and homologous disease.

A review by P. B. Medawar on iso-antigens gives a very useful introduction to this subject, and the papers by P. A. Gorer and J. H. Berrian and R. J. Jacobs detail important recent experimental work on transplantation antigens. The similarity between skin transplantation immunity and hypersensitivity of the delayed type in guinea pigs is discussed by Brent, Brown and Medawar; they consider that their results support the hypothesis that reaction against skin homografts is mediated through cells rather than through serum antibodies. In a very interesting paper R. T. Prehn describes the effects of antigen dosage, route of administration and splenectomy on homograft reaction. He speculates that the spleen may play an important part in the prevention of auto-immunization as well as in the 'enhancement' phenomena by producing an immunity-inhibiting antibody.

Hasek reviews the various methods of inducing tolerance, and Haskova reports that although transplantation antigens are present in cell-free extracts such extracts fail to induce tolerance. Mitchison describes some original experiments on blood transfusion in the fowl and shows that in this system the persistence of tolerance is dependent upon the persistence of the antigen. This paper provoked interesting and stimulating discussion on the nature and mechanism by which tolerance is induced and sustained.

Several papers dealt with the allied problems of the runt syndrome and homologous disease, and ample evidence is presented to support the thesis that both these phenomena are due to the immunological reaction of foreign cells against a tolerant host. Simonsen and Jensen describe an ingenious graft versus host assay, and Gorer and Boyse suggest that the destruction of host lymphoid cells and tissues may be in the nature of an allergic reaction.

One gains the impression that this symposium was of great interest and benefit to those who participated, since many of the most interesting ideas and speculations were brought out in the addenda and discussions. The editors, organizers and publishers are to be congratulated on the speed of publication (the book was available at the end of last year) although the presentation of the book has suffered thereby. There are several errors in the list of contents and the absence of an index is a marked disadvantage both to the general reader and to those seeking a work of reference. The composition and arrangement of the twenty-nine papers varies considerably; only eleven had summaries and of the four papers in French only two had summaries in English. The collection of the material under appropriate subject headings would have been advantageous. For example, although the problem of overcoming the practical difficulties inherent in transplantation is considered in some papers the data are not presented in such a way as to be readily accessible to surgeons and others with little time to read all 453 pages.

However, this is a comprehensive volume of papers for workers in this field and the reviews of recent work would be useful for those already familiar with current trends.

D. M. V. PARROTT

GENERAL PHYSIOLOGY

Principles of General Physiology

By W. M. Bayliss. Fifth Edition by Dr. L. E. Bayliss. Vol. 1. Pp. xiii+520; Vol. 2. Pp. xxii+848. (London: Longmans, Green and Co., Ltd., 1959 and 1960.) Vol. 1, 55*s*. net. Vol. 2, 90*s*. net.

A Textbook of General Physiology

By Dr. Hugh Davson. Second Edition. Pp. xvi+846+32 plates. (London: J. and A. Churchill, Ltd., 1959.) 84*s*. net.

IN 1916 appeared the first edition of "Bayliss" and in 1951 that of Davson. Claude Bernard had defined general physiology as "the study of phenomena common to plants and animals". William Bayliss, in the first edition of his "Principles", had adopted Burdon-Sanderson's definition "the study of the endowments of living materials". Dr. Davson indicated that in practice Bayliss restricted this study to those aspects of living material which showed some immediate prospect of being described in terms of the known laws of physics and chemistry.

He referred to the fact that Dr. Leonard E. Bayliss, son of Sir William Bayliss, was preparing a fifth edition of his father's "Principles". Despite the years since it was first written (1916) and since its last edition in 1924, it still led the field. This fifth edition shows changes in format, in ambit and approach, so marked that even the publishers seem uncertain as to the author. On page iii (the title-page) it is described as by L. E. Bayliss; on page iv as the "Fifth Edition of W. M. Bayliss's Principles by L. E. Bayliss". What does it matter? The genetic interrelationship is so close that the initials are almost of no importance. Dr. Leonard Bayliss has had a bigger task, which he has accomplished by scrapping entirely the old book and writing two volumes, one largely on physical chemistry in its own right and a second (entitled "General Physiology") on the applications in living material. In this, he has been singularly successful, for the internal classification within these volumes is a physiological classification based on function and not on morphological systems. This he has illustrated by studying phenomena at all levels in botany, zoology and microbiology. He has some beautiful discussions on the applications of modern physics in even more modern biology, particularly in the chapter on servo-mechanisms.

Dr. Davson's book has three new chapters, on "Sensory Response", on "Excitability of Cardiac Muscle" and on "Electrical Activity in Smooth Muscle". He stresses functional energy in metazoa and particularly in the integrated vertebrate. He is therefore most informing when discussing the underlying biophysics of mammalian physiology. He has also been able to focus on the last decade aspects of cell structure, particularly the work of Watson and Crick in regard to inclusion bodies, nucleo-protein, the cell membrane, protein synthesis and viruses.

General physiology is splitting into biophysics and biochemistry, and biomathematics. The recent finding of polarization in light coming from Mars, suggesting absorption bands reminiscent of carbon–hydrogen chains and of cellulose, points to a bio-astronomy. The physicist is making serious endeavours to utilize models as an aid to interpretation of the nervous system. Sir Cyril Hinshelwood, in his presidential address to the Royal Society last year, suggested the time is ripe to apply modern scientific disciplines to the study of the paranormal phenomena of extra-sensory perception. The all-in-all book embracing the whole of general physiology is going to be more and more difficult to write and maintain.

These two branches, from the root stem Sir William Bayliss, are most impressive; each author has had a somewhat different task, each has worked differently and each produced a book that is invaluable. What is both interesting and important is that, while different, they integrate and reciprocate with each other and the possession of one is no reason for not possessing the other.

A. ST. G. HUGGETT

ANALYTICAL CHEMISTRY OF POLYMERS

Analytical Chemistry of Polymers

Edited by Gordon M. Kline. Part 1: Analysis of Monomers and Polymeric Materials: Plastics—Resins—Rubbers—Fibres. (High Polymers: a series of Monographs on the Chemistry, Physics and Technology of High Polymeric Substances, Vol. 12, Part 1.) Pp. xviii+666. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1959.) 125*s*.

INDUSTRIALLY, the term high-polymers covers vinyl plastics, condensation polymers—important in the synthesis of fibres, resins and drying oils—natural and synthetic rubbers, proteins, ion-exchange resins and many other special classes. In each of these fields special procedures for physical and chemical analysis have been developed and their description is widely scattered throughout the literature, in industrial specifications and in research reports.

This book, which is the collective work of twenty-six authors who are all members of the staff of American industrial concerns, brings together in one volume methods of analysis which have been used successfully in the determination and testing of commercial monomers and polymers. The methods for the determination of physical properties and chemical composition of each of the major industrial polymers, namely, acrylic plastics, alkyls, amino-resins, cellulose derivatives, epoxy resins, ethylene and fluoroethylene polymers, furan resins, natural resins, phenolic resins, polyamides, polyesters, proteins, rubbers (natural and synthetic), silicones, styrene monomers and polymers, vinyl polymers and co-polymers, and synthetic and natural fibres, are summarized in a separate chapter.

In each case methods are described for the assay and determination of pertinent impurities in the monomers; this is followed by a discussion of analytical problems of identification and characterization of the chemical composition and physical properties of the polymers. Special chapters are devoted to plasticizers, ion-exchange resins and drying oils. In general, the main features of the analytical method and apparatus used are described and the reader is referred to the original publication for detailed directions. In cases where the methods have not been previously published, full details of the procedure are given.

The book provides the best survey and compilation I have seen, and it should be of great use to the practising polymer chemist and analyst. The editor has been successful in bringing together a very valuable collection of information on polymers, and in the second volume, which is in preparation, it is intended to cover the subjects of molecular structure determination, chemical group analysis and identification procedures for polymers.

C. E. H. Bawn

THE ORGANIC CHEMISTRY OF SULPHUR

Aspects of the Organic Chemistry of Sulphur

By Prof. Frederick Challenger. (Organic Chemistry Monographs.) Pp. vii+253. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1959.) 40*s.*; 7.50 dollars.

A CONSIDERABLE portion of Prof. F. Challenger's researches have been concerned with organic derivatives of sulphur, and a book on this subject written by him is greatly welcome. He has chosen six topics to discuss, each as a separate chapter, and naturally occurring organic derivatives occupy a prominent position. Many of the subjects discussed are those which he has studied intensively in the course of his own work, and upon which he can therefore write with particular authority.

The first two chapters, on "Simple Organic Compounds of Sulphur. Properties, Preparation and Biological Significance" and "Natural Sulphonium Compounds, Sulphides, Sulphoxides, Mercaptans and Sulphido-amino Acids" respectively, cover appropriately the widest fields, but even in discussing these comparatively simple classes of compounds the author has a fund of very interesting information on various points which will probably be novel to many organic chemists.

The chapter on "Sulphur Compounds of Petroleum" affords an excellent account of this subject, and the discussion of the desulphurization of organic compounds by Raney nickel, its mechanism, stereochemistry, and various applications is of great value.

Each of the remaining three chapters forms a complete monograph in itself. "The Natural Mustard Oil Glucosides and the Related *Iso*thiocyanates and Nitriles" starts with a very interesting historical review of the early work on oil of mustard, and then covers the modern chemistry of a surprisingly wide variety of compounds in its 146 pages. Prof. Challenger has worked on biological methylation since 1931, and his chapter "Biological Methylation with Particular Reference to Compounds of Sulphur" gives, as one would expect, an authoritative and thoroughly comprehensive account of this subject. Among the many subjects discussed are the mechanism of biological methylation, the transmethylation from methionine and choline, and the formation of 'active methionine' in enzyme systems and its synthesis in the laboratory: the chapter finishes with a discussion of the metabolism of ethanethiol, and the possible mechanism of its anti-tubercular effect. The last chapter is devoted to "Co-enzyme A, its S-acetyl Derivative and Related Compounds."

One quality of this book which greatly impressed me is that it is refreshingly readable. This arises partly from the author's clear natural style, and partly from his gift of presenting and discussing a considerable amount of material in a deceptively unhurried manner, so that, although no words are wasted, the reader never feels that he is being 'crowded'.

This high standard of writing, combined with the author's wide knowledge, makes one wish that he would now, with greater leisure, write a volume which would be the sulphur analogue of Sidgwick's "Nitrogen", that is, a volume in which the preparation and properties of the various classes of organic sulphur compounds would be systematically discussed, and many features of their chemistry critically assessed, without any attempt to achieve a comprehensive account. Several chemists have started on this task, and have fallen by the wayside *en route*: Prof. Challenger's vigour and enthusiasm would take him safely—and still in eminently readable style—to the end of the task.

F. G. Mann

LIGHT-INITIATED ORGANIC SYNTHESIS

Präparative Organische Photochemie

Von Prof. Alexander Schonberg. (Organische Chemie in Einzeldarstellungen, Band 6.) Pp. xii+274. (Berlin: Springer-Verlag, 1958.) 58 D.M.

PHOTOCHEMISTRY is perhaps still considered to be essentially the province of the physical chemist, yet during the past twenty-five years a vast amount of information has accumulated on the use of light to initiate reactions leading to the formation of relatively simple organic molecules (as distinct from polymers of high molecular weight). Prof. A. Schonberg directs attention through his book to the scope and utility of what is rapidly developing into an important section of organic chemistry.

The topics covered by Prof. Schönberg include photo-isomerism; photo-dimerization; photochemical oxidation reactions; addition reactions with olefins and acetylenes; photochemical reactions involving ketones, acids, acyl halides, anthracene derivatives, organic halides, etc.; cyclization reactions; photohalogenation; and photochemical reactions of nitric oxide, nitro-compounds, diazo-, diazonium-, and azo-compounds, sulphur, arsenic, and mercury compounds. Reactions leading to the formation of high polymers are excluded as being outside the scope of the book. Prof. G. O. Schenk's chapter on equipment available on the Continent is of less interest to British chemists than other chapters, but will nevertheless provide useful ideas for the design of photochemical reactors and other apparatus. The book was completed in mid-1957, and literature up to the end of 1957 is included as an appendix.

Experimental details are given for numerous syntheses, and the high yields often obtained will encourage many organic chemists; however, it will often be necessary to read the original literature to ensure that the correct technique is being used.

Many of the reactions described involve free radicals as intermediates, and although a brief summary of the mechanism or the probable course of the reaction is often given, the author wisely restrains himself from over-emphasizing this aspect, and concentrates on the preparative use of photochemistry. For full appreciation of the very many reactions discussed it will thus be necessary for a newcomer to the field to read a standard text on free-radical chemistry.

This book is a useful addition to chemical literature, even though the approach is essentially—and sometimes disappointingly—non-critical. The printing and general lay-out are excellent, making the book easy to read and to use for reference. Some will doubtless wish for an English translation; most would prefer a price lower than £5 2*s*. 0*d*. (4½d. a page).

R. N. HASZELDINE

CHEMICAL NOMENCLATURE

An Introduction to Chemical Nomenclature

By Dr. R. S. Cahn. Pp. viii+96. (London: Butterworths Scientific Publications, 1959.) 10*s*. 6*d*.

THE ever-increasing tempo of scientific research the world over creates *pari passu* new problems of communications between scientists. New phenomena providing evidence of a multiplicity of yet smaller and more perplexing sub-atomic particles—the traditional domain of the physicist; new matter at molecular level formed by the almost infinite range of permutations and combinations of the near hundred atoms of the periodic table—the chemist's field; each demands the utmost care in selecting terms with which to describe them if a scientific Babel is to be avoided. In the field of chemistry the International Union of Pure and Applied Chemistry has, through its various nomenclature committees, sponsored much excellent and fruitful study to which Dr. Cahn from Great Britain has contributed in no small measure. The present booklet is timely, especially in view of recent new developments in inorganic chemistry and the concomitant nomenclature changes. While there are no major changes of principle in organic nomenclature, it is in the inorganic field that older chemists will have to accustom themselves to some radical departures from old familiar names for common substances if they are to be systematic. But the Union is realistic when it refers to a system as "in use but not recommended" and Dr. Cahn is not remote from everyday chemical life when he says, "Probably it will die hard, for ferrous chloride comes more glibly off the older tongue than iron (II) chloride or ferrum (II) chloride or even iron dichloride; but it will probably die in time". So did Charles II.

Throughout, Dr. Cahn treats the intractable problem of reconciling usage with system in a friendly sympathetic style and pedantry rarely obtrudes. The principles are clearly stated and it should be possible for the chemist arriving at the substance $NaH(PHO_2F_2)$ to describe it correctly in his paper to the Chemical Society as sodium hydrogenhydrido-dioxodifluorophosphate, and equally for another chemist searching the indexes in the years to come to find and identify the entry. But much remains to be done, especially with the inorganic heterocycles involving P, N, B, Si, S and the rest, and Dr. Cahn and his colleagues would no doubt prefer that chemists did not spawn exotic new compounds unless they could be given a proper systematic name before a trivial (and possibly misleading) name gained currency in the literature. There is a challenge for the nomenclature or theoretical research chemist to outstrip his experimental colleague and prepare the name ready for the substance.

The organic section lucidly states current principles but contains one or two disconcerting errors. Thiocresol $C_6H_4Me.SH$ could surely never have the systematic name toluene-ω-thiol nor has glycollic acid ever been $HO.CH_2.CH_2.COOH$. Dr. Cahn rarely nods and he should correct these errors. To perplex chemists there is a Mitford-like disapproval of 'mesyl' while 'tosyl' appears to be 'U' in some places. Half a guinea for such a small booklet is the price for quality, not bulk.

H. J. BARBER

ELECTRONIC STRUCTURE OF MOLECULES

Die Methoden der Molekülphysik und ihre Anwendungsbereiche

Von H. Preuss. (Fortschritte der Physik, 1 Sonderband.) Pp. vii+167. (Berlin: Akademie-Verlag, 1959.) 22 D.M.

FIRST of all, the title is wrong. For despite its label this is not an account of the methods of molecular physics. If it were, it would contain some discussion of statistical mechanics, perturbation theory, properties of angular momentum and of spin, influence of electric and magnetic fields on molecules, etc. In fact it is solely concerned with the electronic structure of molecules, the techniques used and the type of result obtained.

Dr. Preuss is already well known to workers in the field of the wave mechanics of molecules as the author of a series of three books containing the numerical values of the various Coulomb and exchange integrals which play such a large part in it. The present book could be regarded as a compendium of the fundamental methods which are involved when using these integrals.

There is an introductory chapter on what is described as "Semi-empirical Theories", followed by the two main chapters of the book, on theoretical, and semi-theoretical, calculations. This particular classification is not one that has hitherto been used to divide up the field. But it has a good deal to commend it. Previously it has been more customary to have separate chapters on the molecular-orbital method and the valence-bond method: and each chapter has covered both the *ab initio* calculations and the semi-theoretical ones. To-day, however, no one wants to flog the old horse by arguing which is the better, since we know that for an attempted accurate calculation neither is satisfactory unless it is modified to such an extent that it merges with the other. The separation chosen by Preuss corresponds much more closely with the way that present-day work is being organized. On one hand there are those who want as exact an estimate of the energy and the wave function, as can be obtained. Ideally these people will use no empirical data whatever. On the other hand there are those who want to understand the reasons why molecules behave as they do—why, for example, their colour shifts to the red on methylation, or why carbon-hydrogen bond lengths are nearly, but not quite, constant.

Of the two main chapters the 'non-empirical' one is the better and includes several theories such as the density matrix, and the method of configuration interaction, not usually covered in text-books: and also Löwdin's natural spin orbitals. But it suffers from an undue emphasis on the two-electron atom. The chapter entitled 'semi-empirical theories' seems to be rather out of balance, with several huge lists of not very important numerical results, and scarcely any serious attempt to provide a critique for the approximation being discussed. But it does give a useful survey of Moffitt's method of atoms-in-molecules: and of the free-electron gas model.

C. A. Coulson

CHEMICAL THERMODYNAMICS

An Introduction to the Study of Chemical Thermodynamics

By Prof. D. H. Everett. Pp. xx+240. (London: Longmans, Green and Co., Ltd., 1959.) 28*s*. net.

Bases Fondamentales et Applications de la Thermodynamique Chimique

Par Prof. Maurice Dodé. Tome 1: Les Principes, Les Systèmes Ideaux Gazeux, et avec Phases Condensées Pures. Pp. iv+516. (Paris: Société d'Edition d'Enseignment Supérieur, 1959.) 4,000 francs.

The authors of these books are enthusiasts about thermodynamics, but with rather different outcomes to their enthusiasm. Prof. Everett shares the view of P. Duhem (1903) that the range of scientific studies to which thermodynamics is applicable is extremely broad. There are aspects of this universal discipline of interest to philosophers, mathematicians, physicists and chemists—we would now add biophysicists and biochemists to Duhem's list—but different treatises are needed for each of these groups of savants. This makes it particularly important to prepare for such advanced treatises by introductory work carefully designed to lead in the appropriate direction. Everett's book leads to chemical thermodynamics. He is well aware of the confusion and boredom induced in future chemists by many introductory treatments of thermodynamics which stress the physical, philosophical or pseudo-engineering aspects, or which over-emphasize its mathematical elegance and rigorousness. To avoid these educational mishaps, Everett's text starts by getting readers interested in the use of thermodynamic equations, and familiarized with accurate and quite complex symbolism before they are led to examine the fundamental laws of thermodynamics with any degree of profundity. The book is designed to serve the needs of university students up to pass degree level in chemistry, or as a subsidiary to main biological subjects. It leads on to more advanced treatises in a very effective way. The chapter on "Conditions of Chemical Equilibrium" seems particularly noteworthy in an elementary book of this kind; there are many other useful sections. Not every reader will find mechanical analogies of thermodynamics in the text easier to follow than their thermodynamic counterparts, but there is no doubt that the book as a whole is a very valuable contribution to the teaching of 'chemical' thermodynamics in the all-important elementary stages. The book should promote confidence and accuracy in students, though the examples for working given in the appendix should probably be amplified and diversified for use in a teaching course.

Like Prof. Everett's book, the text by Prof. Dodé is intended to serve the needs of students of chemical thermodynamics, in this instance chiefly industrial chemists and chemical engineers. British readers will find it a much more untidy and probably a much less useful work. It is less carefully contrived to induce a strong and accurate grasp of chemical thermodynamics by elementary students. Dodé's book quite rightly stresses the usefulness and power of De Donder's affinity function and refers rather charmingly to "L'affinité chimique, cette vieille notion restée si longtemps d'ordre sentimental". But the text contains much extraneous matter of mainly physical, semi-historical or philosophical nature. Calculations of chemical equilibria are described in very considerable detail. Some of the material quoted seems rather out of date. More powerful and convenient procedures could be found, particularly in some of the American text-books quoted by Everett for further reading.

A. R. Ubbelohde

A STRUCTURAL TOOL FOR THE CHEMIST

Nuclear Magnetic Resonance

Applications to Organic Chemistry. By Prof. J. D. Roberts. (McGraw-Hill Series in Advanced Chemistry). Pp. viii+118. (London: McGraw-Hill Publishing Company, Ltd., 1959.) 46*s*. 6*d*.

The nuclear magnetic resonance spectrum of an organic liquid, observed under high-resolution, provides the organic chemist with a pattern of lines characteristic of the molecule. The position and intensity of the lines and their multiplet splitting can in favourable examples tell him what groups are present in the molecule, and how they are joined together. He thus has yet another tool to help him to identify a product, confirm or reject a structure, distinguish between isomers, detect and measure chemical exchange, and determine the kinetics of a reaction. The timely development by Varian Associates of the necessary commercial instrument led to rapid and widespread exploitation of the method by organic chemists, particularly in North America.

Although there are a number of learned works which dwell on the physical theory and practice of the phenomenon there was no book which provided a simple introduction to the less mathematically minded chemist. Prof. Roberts's very readable monograph fills this want. Apart from an appendix there are only six equations in the book. The essentials are introduced in a few well-chosen words, illustrated clearly, and doubtless expensively, by diagrams in three colours. It is assumed that the reader will be using the crossed-coil detection system, an assumption which was generally correct for this type of work in the past, but which is becoming less justified now that single-coil spectrometers are finding their way on to the market. The organic chemist is given an attractive presentation with well-chosen examples of what this new tool will do. The physicist is no less fascinated by the account of the chemical applications by a practising chemist. The book closes with an intriguing set of problems with which the reader is invited to beguile the time by identifying twenty pure compounds from their proton resonance spectra given only their molecular formulæ.

E. R. ANDREW

THEORY AND PRACTICE OF SEDIMENTATION

Ultracentrifugation in Biochemistry

By Howard K. Schachman. Pp. xii+272. (New York: Academic Press, Inc.; London: Academic Press, Inc. (London), Ltd., 1959.) 8·80 dollars.

THIS monograph is very welcome. The bibliography lists more than two hundred papers dealing with technical innovations, new applications of sedimentation techniques and modifications and extensions of sedimentation theory which have appeared since the publication of Svedberg and Pedersen's original book on the ultracentrifuge. It is a great asset to have this mass of work organized and critically discussed.

Dr. Schachman has restricted himself primarily to the description of the principles underlying the use of the analytical ultracentrifuge (preparative centrifugation is not mentioned) and to a survey of the many applications which are of interest to biochemists. Throughout the monograph, though, the emphasis is on problem and technique rather than on the biochemical value of the results. Indeed the index contains only one entry relating to a specific solute, human serum, and this reference deals with a remarkable boundary anomaly which shows how difficult it can be to assess relative concentrations in a multicomponent system. The absence of data on specific macromolecules is perhaps inevitable, since there are very few results in the literature which meet the stringent requirements of an error of only a few tenths of a per cent which the author demonstrates is now technically possible, and very few published photographs of schlieren boundaries will bear comparison with the beautiful examples to be found in this book.

A comparatively short section on experimental aspects includes a description of the merits and uses of the different types of cell now available and a general discussion of the principles and practical limitations of the schlieren, absorption, interferometric and Lamm scale optics. Useful practical advice is also to be found in the later chapters. The interpretation of sedimentation data is dealt with succinctly, the reader being referred to the several excellent reviews available for more detailed discussion. The greater part of the monograph is devoted to an exposition of theory and practice in sedimentation velocity and sedimentation equilibrium experiments and the increasingly important method of determining molecular weights by the method of Archibald. In the section on sedimentation velocity experiments a clear differentiation is made between those aspects of analysis which are based soundly on theory and those, for example the extrapolation of results to infinite dilution, which are still essentially empirical. There are surprisingly large fields which have as yet received little or no theoretical investigation. The complexity of the computations required to derive all the information possible from any one set of experiments is well brought out and makes one echo the author's hope that some of the labour will be reduced by the development of automatic scanning and registration techniques to replace the photographic methods now in use.

It is evident from the steady stream of papers now appearing that the dramatic developments in the application of sedimentation techniques to biochemical problems which has occurred during the last decade has by no means ended. Dr. Schachman's monograph provides an admirable basis for the appreciation and assessment of future work.

K. V. SHOOTER

CHEMICAL ANALYSES OF ROCKS

Petrochemische Berechnungsmethoden auf Äquivalenter Grundlage

Von Prof. Conrad Burri. (Methoden von Paul Niggli.) (Lehrbucher und Monographien aus dem Gebiete der Exakten Wissenschaften. Mineralogisch-Geotechnische Reihe, Band 7.) Pp. 334. (Basel und Stuttgart: Birkhäuser Verlag, 1959.) 38 Swiss francs; 38 D.M.

THIS well-produced volume deals with methods of recalculating chemical analyses of rocks (chiefly igneous and metamorphic rocks) on a comparative basis, and the methods discussed are mainly those devised by the late Prof. Paul Niggli, of Zurich, though some reference is also made to the calculations of T. F. W. Barth and P. Eskola on the basis of anion percentages and standard cells.

The book is the most complete treatment of the methods of calculating the so-called Niggli values (*si*, *al*, *fm*, *alk* and so on) and of their use which has so far appeared, a use which has had a considerable vogue among European petrographers, but only a limited appeal to workers in Great Britain and in the United States. There is also a very full account of the Niggli norm, devised to supersede the Clark-Iddings-Pirsson-Washington norm, the disadvantage of which is that the standard minerals used as a basis of calculation rarely correspond completely with the actual mineral composition, or mode, of the rock. The Niggli equivalent-norm has the advantage that phases such as the amphiboles and the micas can be represented in the calculations when they are present, but it would be a mistake to expect, even using this method, any really exact correspondence between norm and mode. Indeed, the description of this book as a "Monograph in the Field of Exact Science" is, in the reviewer's opinion, scarcely justifiable when the persistent inaccuracy of the method, and of even the best of chemical analyses of rocks, revealed by the international investigations of the past ten years, is recalled. Many petrographers now doubt whether it is proper to base elaborate calculations or classifications on such a shaky foundation. However, for those who still enjoy this exercise, here is a work after their own hearts. The new tables of molecular percentages included as an appendix are probably the best so far produced, and there is a wealth of illustration of graphical representation of the results of the calculations, for example, in triangular plots.

The author rightly claims priority for 'petrochemical' as a term to cover the chemistry of rocks and looks askance at the increasing use of the term to describe chemicals derived from petroleum. It might be suggested that the latter usage is now so widespread that it would be advisable to abandon petrochemical as a term of geology, and leave it to the chemical engineer. K. C. DUNHAM

GEOLOGICAL WAYS AND BY-WAYS

Principles of Geology

By James Gilluly, A. C. Waters and A. O. Woodford. Second edition. (Series of Geological Texts.) Pp. viii+534. (San Francisco: W. H. Freeman and Company; London: Bailey Bros. and Swinfen, Ltd., 1959.) 7.50 dollars; 64s.

"PRINCIPLES OF GEOLOGY" appeared in 1952 when it was welcomed as an original and stimulating book. Clear style, remarkably little jargon and arresting illustrations were obvious virtues. Now, after seven years, when the first edition has proved useful to teachers and taught alike, the second edition has appeared, printed on a larger page, setting off figures and plates advantageously. The sequence of the chapters has been logically rearranged with a modicum of rewriting to incorporate some recent work and to expand the reviews provided on certain topics. The authors have retained their approach of furnishing short sketches of the people, like Nicholas Demarest, for example, involved in making geological discoveries, or in the controversies arising from them. The principle of uniformitarianism is sustained throughout, although some of the extraordinary incidents described as occurring in storms and floods supply live ammunition for the neo-catastrophists.

The selection of examples of geological phenomena fulfils the condition that "all the world's a stage", the Old World and the New, continents and oceans alike. Thus an earthquake, landslide and turbidity current intimately related to one another are demonstrated from the Grand Banks in 1929; the quiet sinking of a large region shown by a swamped river system in Indonesia, while building-stones in Glasgow's houses are used as evidence that deserts like those in present-day Nevada once existed where now flows the Clyde.

To me the locating of Funafati as "not far from Tarawa of World War II fame" is a case of the cart before the horse. In the new grouping sedimentary rocks and the environments of deposition get a chapter to themselves, but we "go out through that same door where in we went" in that the origin of dolomite is still mysterious. A later chapter commences with an account of the Lisbon earthquake of 1755, leads downwards through sial and sima to the Mohorovicic discontinuity into the mantle until it comes to the core of the earth, stuffed, as formerly, with question marks.

The discussion of mountains is excellently done and covers some familiar ground, but this is so vividly described that it leaves no doubt what the writers mean or where they stand in the realm of Alpine theories. Two points are of special interest. The first is the brief revised account of the "Basin Ranges" in the south-western United States. The individual ranges often have diverse and complicated structures not clearly related to any discernible geosyncline. Each one stands apart from its neighbours and is bounded by normal faults. The second is the comparison of the river-carried deposits of the Bramaputra and Irrawaddy respectively, thus presenting the idea also advocated by Kuenen[1] that substantial filling of a geosyncline may be accomplished along its trend and need not necessarily originate from its flanks.

It is a surprise to find a book of this character with so little to say about rift valleys and the recently described intriguing long straight fracture zones in the eastern Pacific, but perhaps something has to be held in reserve against a third edition. Recalling the scope of an ancient text-book like G. A. J. Cole's "Aids in Practical Geology", it is odd that the two geological handmaids, mineralogy and petrology, have each an appendix devoted to them but palæontology is omitted. Nevertheless, here is a book which all geologists will read with profit and enjoyment, and there will be few whom it does not caress or jolt into having to think. J. V. HARRISON

---

GLOSSARY OF GEOLOGICAL TERMS

Geological Nomenclature (English–Dutch–French–German)

Edited by A.A.G. Schieferdecker. (Royal Geological and Mining Society of the Netherlands.) Pp. xvi+523. (Gorinchem: J. Noorduijn en Zoon, N.V., 1959.) 45 guilders.

IT is now thirty years since the Royal Geological and Mining Society of the Netherlands published a glossary of geological terms in the Dutch language, with English, French and German equivalents. The work noticed here is an entirely new production sponsored by this Society, and prepared by a team of collaborators of several nationalities. It has become necessary as a consequence of the progress of geological and closely allied sciences in the interval; which has led to the introduction of new concepts, new terms and new methods of carrying out geological investigations. Furthermore, and this is of particular interest to English-speaking geologists, because, in the opinion of the sponsors, the English language has become increasingly dominant in geological literature, the new edition has been prepared in English. Thus, the introductory matter and table of contents are in this language, and the terms and phrases are given first and defined in English. These are followed by their Dutch, French and German equivalents.

The glossary contains 5,489 entries, and is arranged by subjects, there being eleven main divisions. Each of these is again divided, sometimes into as many as ten or eleven subdivisions, and the latter are again divided into smaller subject groups. Such an arrangement was no doubt essential in preparing the glossary, since the various subdivisions have been compiled by a large number of specialist collaborators but it does not make for ease of reference. This difficulty has been overcome by numbering consecutively all the entries, and their inclusion in a single four-language alphabetical index in which the reference to any particular term is by number, whichever language is used in consulting the index. Cross-reference from index to text can thus be made rapidly.

The principal divisions cover general and physical geology; geomorphology; sedimentation; stratigraphy; tectonics; geophysics; orogeny; vulcanology; petrology of igneous and sedimentary rocks; and mineral deposits. Crystallographic terms and the names of minerals, rocks and stratigraphical formations have been omitted from this edition; and palæontological terms are not included. It is a little surprising that among the list of collaborators there are few who may be supposed to have English as their mother tongue; but this omission is seldom apparent in the text and, where noticeable, without serious results. In choosing terms for inclusion in the glossary the editor has cast his net widely, and both glossary and index appear to have been compiled with much care. There is no doubt the book will form a valuable addition to geological, geographical and engineering libraries. Welcome as this new glossary is, in view of the very large amount of geological literature now appearing in the Russian language, often without adequate summaries in western European languages, the preparation of a supplement of Russian geological terms, in which the same index figures could be used, would be an extremely useful compilation. V. A. Eyles

LOW-ENERGY NUCLEAR PHYSICS

Proceedings of the International Conference on Nuclear Physics

Low-Energy Nuclear Interactions and Nuclear Structure, Paris, 7–12th July, 1958. Presented by Mme. P. Gugenberger. Pp. v+950. (London: Crosby Lockwood and Son, Ltd., 1959.) 140*s*. net.

The international meeting of nuclear physicists held in Paris during July 1958 yielded the conference report under review, dealing essentially with low-energy nuclear physics. The conference and the preparation of the report (carried out by Mme. P. Gugenberger) were made possible financially by the United Nations Educational, Scientific and Cultural Organization and the International Union of Pure and Applied Physics, augmented by various other public and private sources. The volume of 1,600 pages reflects in its structure the new style of conference: specialist rapporteurs present the relevant contributions offered by members of the conference as survey papers, thus producing a well-knit whole out of a number of components. This survey is printed verbatim as are the discussion remarks following the rapporteurs presentations (325 pages). The rest of the volume contains the text of the communications, with an author index (612 pages).

My personal reaction to this volume is one of delight. The text gives the reader the impression of being present at the meeting, and the discussion produces a lively atmosphere through argument and counter-argument; as a result one can learn much about the subject with considerably less effort of will than from the original papers. Naturally, the rapporteur has already spent some effort in digesting the contents of a bunch of scientific papers. It seems clear that this type of conference and its reporting methods are here to stay. It is more stimulating and more informative than the string of 10-minute talks with which one is familiar from Physical Society meetings.

The conference was opened by Prof. F. Joliot on July 7, 1958 (five weeks before his death) and closed with an illuminating summary by Prof. L. Rosenfeld. The various sections deal with the following topics: (*a*) Elastic Scattering of Neutrons (H. H. Barschall); Charged Particles (A. E. Glassgold). (*b*) Scattering and Nuclear Forces: Scattering by Electrons (R. Hofstadter); Analysis of *p–p* Scattering below 40 MeV. (M. H. McGregor). (*c*) Direct Interaction: Theory (C. T. De Dominicis); Deuteron Stripping (G. R. Satchler); Experimental (B. L. Cohen). (*d*) Heavy Ions (A. Zucker). (*e*) Photonuclear Reactions (J. S. Levinger). (*f*) The Independent Particle Model and its Connexion with the Collective Model (A. M. Lane, S. A. Moszkowski). (*g*) The Collective Model (A. Bohr); Coulomb Excitation (F. K. McGowan). (*h*) Structure of Nuclear Matter (C. Bloch). (*i*) Weak Interactions: Theory and Experimental Results (R. Nataf).

It is regretted that the text of the Russian contributions was not received in time for incorporation in the report.

Mme. P. Gugenberger and the publishers are to be congratulated on producing this fine conference volume; they both deserve the gratitude of the nuclear physicists. E. Bretscher

ROCKET PROPELLANTS

Rocket Propellants

By Francis A. Warren. Pp. ix+218. (New York: Reinhold Publishing Corporation; London: Chapman and Hall, Ltd., 1958.) 52*s*. net.

This book is designed to provide both the technical reader and the newcomer with basic information on the propellants used in modern rockets. The author has been directly associated with the development of propellants and rockets since 1942 and is well qualified to write a book on this topic. There are chapters dealing with the different types of propellants (both solid and liquid), propellant ingredients, the manufacture of solid propellants, performance and burning characteristics, the more important design features in both solid and liquid motors, safety, quality control and the future of rocket propellants. For a book of its size all these subjects are dealt with very adequately; the matter is clearly presented and supported by a useful selection of photographs, line drawings and graphs. There is surprisingly good coverage of the possible combinations of fuels and oxidants, and in the early chapters one frequently encounters novel items of information and 'know-how' not previously seen in publications of this kind.

The bibliography quoted is extensive but, perhaps inevitably, predominantly American. During the Second World War, and particularly in its early stages, the Americans were supplied with a great deal of information from Great Britain about the design and manufacture of small solid-propellant rocket motors. It is always a little disappointing that British workers who have played a conspicuous part in these developments are not as well known as they deserve to be, mainly because they have been associated with material which only slowly finds its way into the 'open' literature.

While the book is very readable and informative, there are some omissions. For example, in the section dealing with composite propellants there is no mention of 'plastic propellant', a wholly British concept which started during the War. This propellant has a good performance and possesses exceptional chemical stability. Its main ingredients are ammonium perchlorate (the oxidant) and a hydrocarbon binder (the fuel); these are mixed together to form a stiff 'putty' which can then be pressed into the desired shape in a rocket tube. Plastic propellant is used in a range of fairly large motors, notably in the *Skylark* rocket, which has been employed in the upper atmosphere research firings in Australia.

In the discussion on "Ballistic Agents", minor ingredients used to modify the burning characteristics of propellants, it is mentioned that potassium sulphate was originally used to reduce the flash and smoke in guns. This latter point, that is to say, smoke reduction, is incorrect, since any inorganic additive must aggravate the smoke problem. However, the book is well edited and no slips of real significance have been noted.

The final chapter deals with "The Future of Propellants". This outlines very clearly the possibility of developing propulsion systems of greatly enhanced performance by various applications of nuclear power.

The author is to be commended on producing a very readable book which contains a useful blend of basic information and technology. It can be recommended to those seeking a good introduction to all aspects of rocket propellants. W. B. LITTLER

AN EASY GUIDE TO RADIO ASTRONOMY

Radio Studies of the Universe

By Dr. R. D. Davies and Dr. H. P. Palmer. Pp. viii+200+14 plates. (London: Routledge and Kegan Paul, Ltd., 1959.) 25*s.* net.

AS the joint authors of this book are two experienced radio astronomers working at the Jodrell Bank Experimental Station, the authoritative nature of the material is assured. The book is intended for the non-specialist, and does not assume any appreciable previous knowledge of either radio or astronomy. It can be recommended as a useful and informative outline of the results achieved in all aspects of this progressive new branch of scientific activity.

The book begins with a brief outline of optical astronomy; then a description of radio methods is followed by an account of the various sources of radio emission beyond and within the Galaxy including the Sun and solar system. Subsequent chapters deal with the application of radar to the study of meteors, auroræ, the Moon and planets, and the contribution of radio-astronomical methods to the study of the Earth's upper atmosphere. There are a useful glossary and a selected list of references. The book is printed in large type and illustrated with plates and diagrams.

The writing of books of this class, often described as 'semi-popular', presents the problem of conveying a correct meaning without encumbering the reader with the detailed concepts of rigorous treatment. In this elementary survey of radio astronomy, the authors have for the most part succeeded well in this respect. In some places a slight amplification would have been helpful. It would have been worth attempting to show, possibly in a further appendix, how the expressions for the beam-width of a radio telescope and for the lobes of an interferometer pattern are derived, as these involve only elementary ideas of wave motion. The significance of band-width in radio noise reception could also have been more adequately covered.

Only in a few instances could one feel more particularly critical of the authors' approach. For example, a statement that the amount of radiation received by an aerial is proportional to its area is followed by a discussion of linear aerials, and it is not made clear what 'areas' they possess. Later, radar echoing properties of objects are again loosely identified with their 'areas'. A different type of misleading impression arising from inadequate explanation occurs, for example, in the description of visual solar activity, where a statement ". . . when the outer edge of the Sun is viewed through a telescope . . ." neither suggests the necessary precautions nor the special technique involved in making optical solar observations. It would not, however, do justice to the book to dwell unduly on a few defects of detail. The book as a whole provides a simple and comprehensive guide to radio astronomy. J. S. HEY

PROBLEMS OF SPACE FLIGHT

Vistas in Astronautics

Vol. 2. Edited by Morton Alperin and Hollingsworth F. Gregory. Second Annual Astronautics Symposium sponsored by Air Force Office of Scientific Research, and Institute of Aeronautical Sciences. (International Series of Monographs on Aeronautical Sciences and Space Flight. Division 7: Astronautics, Vol. 2.) Pp. x+318. (London and New York: Pergamon Press, 1959.) 105*s.* net.

THE second Astronautics Symposium organized by the U.S. Air Force Office of Scientific Research was held at Denver, Colorado, in April 1958, and this volume records the proceedings. The papers can conveniently be divided into four groups. The first group is concerned mainly with scientific experiments in space, and includes a concise survey by S. F. Singer of the outstanding scientific problems in the region out to the Moon's distance. The second and largest group deals with the propulsion, orbits, control and guidance of space vehicles. There is a significant paper by A. Ferri and others, who conclude that the use of turbo-jet and ram-jet engines in the launching missiles for space vehicles, up to speeds of say Mach 4, might considerably reduce the weight at launch and the rocket thrust required. Another notable contribution comes from J. H. Laning, jun., and others, who describe a design study for a vehicle to go near Mars, to photograph it, and to return.

The third group of papers records a discussion panel on the question "What use is man in space?" The answer given by almost all the speakers was: "not much use at all". But the U.S. Air Force chairman stoutly resisted this undermining of the Symposium's *raison d'être* by saying that man will, nevertheless, go into space.

The fourth and most controversial group of papers is concerned with the Moon. First, T. Gold argues persuasively that the Moon's surface is deeply covered in dust: "the top few feet may well be extremely loose and more treacherous than quicksand". Then F. L. Whipple, just as persuasive, contends that the dust must cement "into a weak, porous matrix" under the bombardment of meteorites, corpuscular radiation, etc. Finally comes G. P. Kuiper, whose paper is the most striking in the book, since it contains twenty-three magnificent photographs of the Moon, mostly full-page: after surveying the lunar topography in detail, Dr. Kuiper finds "overwhelming evidence that the traditional view that the mare floors are *lava fields* is correct"—a rebuff for the dust-men.

These technical papers, which take up most of the book, form a valuable record; but the same cannot be said for the introductory material, which often sounds too nationalistic a note. Nor is the editing perfect: for example, a three-line footnote on p. 139 has somehow escaped the deletion it obviously deserves, and the grouping of the contributions is not entirely logical, since the solitary paper on "Space Navigation" appears in the section entitled "Control and Propulsion . . .", and not in the section on "Departure, Space Navigation and Re-entry", which would seem to be its proper home.

D. G. King-Hele

PLANETARY DYNAMICS

Celestial Mechanics

By E. Finlay-Freundlich. Pp. viii+150. (London and New York: Pergamon Press, 1958.) 50*s*. net.

Stability in Celestial Mechanics

By Prof. Yusuke Hagihara. (Jubilee Publication in Commemoration of the Sixtieth Birthday of Prof. Yusuke Hagihara, by his Friends and Pupils.) Pp. x+106. (Tokyo: Kasai Publishing and Printing Co., 1957.) n.p.

TEN years ago it was commonly thought by many astronomers, most mathematicians and almost all physicists that celestial mechanics was a dead subject of historical interest, that it had been worked out, and that it was unlikely in the future to yield new results of fundamental importance. The advent of artificial satellites has led to a re-awakened interest in many of the problems of celestial mechanics. It is therefore quite appropriate that new text-books should be written not only to cater for the new demand but also so that those unfamiliar with the subject may become acquainted with the vast body of knowledge which exists and of which they might otherwise remain ignorant.

The two books under review are of quite different kinds. Prof. Freundlich's book is a self-contained introduction to the subject. After a brief introductory chapter, the *n*-body problem is discussed, including Lagrange's solutions to the three-body problem, the singularities of the three-body problem and periodic solutions in the neighbourhood of the points of libration. This is followed by an outline of the application of the Hamilton-Jacobi theory, a discussion of the principles underlying perturbation theory, and several discussions on the problems of periodic motions. The book ends with chapters on the two-body problem for extended deformable bodies and on the motion of the apsidal line in relativistic mechanics.

The most surprising feature of the book is the discussion in a relatively elementary way of so many advanced topics, and this is to be commended. It is unfortunate, however, that space was not found for a rather more detailed discussion of some of the basic problems. For example, many university mathematical courses in dynamics end at Lagrange's equations, and proofs of Hamilton's equations and the Hamilton-Jacobi Theorem (without the use of contact transformations) would have added to the value of the book. Also a course on celestial mechanics can scarcely be considered complete if it does not include the equations for the variation of the elements of an orbit. This is, after all, the feature of celestial mechanics of most interest for artificial satellites. Those who, like myself, are frequently charged with the duty of giving formal lecture courses in celestial mechanics, will be grateful to Prof. Freundlich for providing in this text a useful survey of the subject, but they will of necessity supplement this survey with selections from more advanced books to fill the more obvious lacunæ.

Prof. Hagihara's book was published by his friends and pupils to celebrate his sixtieth birthday. He has attempted to summarize the present situation in the efforts towards solving the very difficult problem of the stability of the solar system. His book ranges widely over many difficult aspects of celestial mechanics, and, by omitting or outlining proofs, he succeeds in giving in a short space an exhaustive survey. He discusses the results of the most advanced research work more completely than any existing text-book or review, and gives comprehensive bibliographies. His book is a land-mark in celestial mechanics.

Neither of the books under review contains any discussion of the numerical problems of celestial mechanics, and it is to be hoped that someone will be stimulated into filling this gap in the literature.

R. H. Garstang

STEVIN'S MATHEMATICAL WORKS

The Principal Works of Simon Stevin

Edited by Prof. D. J. Struik. Vol. 2A: Mathematics. Pp. v+1–456. Vol. 2B: Mathematics. Pp. iii+457–976. (Amsterdam: Swets and Zeitlinger, 1958.) n.p.

THESE two volumes comprise Stevin's principal mathematical works. The first begins with an account of his little known "Tables of Interest" (1582). In a period of rapid commercial expansion, when even the ordinary arithmetical operations still presented difficulty, the computation of interest called for no little skill, and so the appearance of Stevin's "Tables" must have proved a boon to the great banking houses, such as those of Lyons and Antwerp. Many readers will be interested to trace, with the help which Prof. D. J. Struik has abundantly provided, the origins and the growth of such tables; they will be grateful for the translation and the copious references provided.

The "Problemata Geometrica" deals with the division of polygons into parts having a given ratio. The *regula falsi*, a favourite device of the mathematicians of the Middle Ages, is freely used. Then follows a study of the regular and semi-regular polyhedra and the construction of polyhedra similar to a given polyhedron. Stevin follows closely in the footsteps of Euclid and Archimedes without removing many of their obscurities. The ample footnotes provided have at least succeeded in making a difficult subject attractive.

Probably the most interesting section of Stevin's work is his exposition of the principles underlying the use of decimal fractions. Prof. Struik's judgment: "It is safe to assume that Stevin's work contributed to the growing popularity without ascribing the success exclusively to him" (p. 377), is very fair, and it is supported by an exhaustive list of references to pioneers in the development of this branch of arithmetic. The facsimile reproduction of "La Disme", and its side-by-side translation, cannot but be accorded a warm welcome from those who have not access to Stevin's original tract. Nevertheless, it is extremely doubtful if the decimal system of writing fractions would have achieved such a wide popularity had it remained in the clumsy notation which Stevin adopted. A number of writers of the period who employed decimal fractions, either with or without Stevin's notation, follow the exposition. The omission of the names of Oughtred and Wallis is a little surprising. The former, in his "Clavis Mathematicæ", adopted a much more convenient notation. "Decimal parts are written in the same line with integers . . . They take their denomination from the place of their last figure, as 0/5 are five-tenths, 0/56 are fifty-six hundredths". Wallis, in his "Mathesis Universalis" (1657) followed Oughtred's notation, but in his "Algebra", written nearly thirty years later he sometimes uses the full stop, as 3.14159, and sometimes the comma, as 12,756.

The main merit of Stevin's "L'Arithmétique" is the systematic way in which he discusses operations with rational, irrational, and algebraic numbers, and the theory of equations of the second, third and fourth degrees. Here the editor shows an intimate knowledge of the steps which led to the solution of algebraic equations during the fifteenth and sixteenth centuries, and he has placed the reader very much in his debt by his exhaustive bibliography. He rightly criticises Stevin's interpretation of powers higher than the cube as "a clumsy procedure". Not everyone, however will agree with his view that "the way out towards spaces of higher dimensions only appeared in the nineteenth century". For did not Descartes ("La Géométrie", 1637) point the way when he threw aside the dimensional restrictions of earlier writers (for example, Vieta) and divorced such expressions as a^2, b^3, and higher powers from reference to physical quantity? These are nothing more than the terms of a continued progression, the first term being unity. They should not, therefore, have caused any embarrassment in explaining powers higher than the cube. In this section of the work no little skill is shown in the selection for reproduction of those passages which best illustrate the sixteenth century approach to the solution of equations.

Readers will welcome the section dealing with Stevin's contribution to trigonometry, which is preceded by a brief account of the development of the subject from Ptolemy. The chief feature of this, in Prof. Struik's judgment, is the clarity of its exposition. This view will be readily accepted. But there was rather more in it than this. It was only a few years prior to the appearance of this work that trigonometry had emerged as an independent science. Stevin's contribution gave a great impulse to a movement which was already rapidly gathering strength.

Stevin's work on perspective is probably among the most original of all his work. It was written in the vernacular, and this may well be a reason why it has not become widely known outside the Low Countries. Prof. Struik's translation does much towards removing this limitation.

The appearance of these two volumes goes a long way towards filling a gap in our acquaintance with Stevin's mathematical work. They illustrate the vast range of his contributions to the subject. His gifts, outstanding as they were, have been overshadowed by those of his great contemporaries and successors. For Stevin lived in an age of intellectual giants—Vieta (1540–1603), Galileo (1564–1642), Kepler (1571–1630), and he was followed by men no less distinguished—Wallis (1616–1703), Fermat (1601–1665), Pascal (1623–65), Descartes (1596–1650)—to name but few. This, together with the fact that much of it was written in Flemish, may be a reason why his work has hitherto not received at the hands of the historian of science the recognition which is its due. Prof. Struik has gone a long way to remedy this situation, and the appearance of later volumes will be awaited with considerable interest.

The only feature open to serious criticism is the index, which, for a work of nearly a thousand pages, is condensed into a few columns. Would it be too much to hope that, in subsequent volumes, Prof. Struik will devote as much care to the compilation of a really helpful index as he has done to the rest of the work?

J. F. Scott

GÖDEL'S THEOREM

Gödel's Proof

By Ernest Nagel and James R. Newman. Pp. ix+118. (London: Routledge and Kegan Paul, Ltd., 1959.) 12*s*. 6*d*. net.

FROM time to time a little masterpiece of exegesis appears in the field of mathematics and physics: this little manual is certainly such a one. It deserves a place with Sylvanus Thompson's "Calculus Made Easy", and Biggs's "Wave Mechanics". But in a sense it is better than either of them, in that it manages to convey the spirit of the genius of Kurt Godel, and to show his achievement of 1931 (at which time he was twenty-five years old) as at least comparable with Euclid's, when he selected the particular form which he did to enunciate the parallel postulate, realizing at the same time that proof was needed, but impossible to supply. It is curious that, as in Godel's theorem, it is in these declarations of impotence that mathematicians sometimes reach their zenith. In demonstrating, and accepting, the impossible, mankind (paradoxically) breasts its summit.

Throughout history, the axiomatic method has gained favour, and advanced from strength to strength. Seen in full vigour in Euclid's geometry, it appears again for mechanics in the hands of Archimedes. Centuries later, something akin ran in the mind of Descartes, and in our own century (1908) we find it in the *Axiomatik* of Carathéodory's thermodynamics. What more fitting for it to support the great structure of arithmetic, and the aesthetic satisfaction of David Hilbert's systematic foundations ? Yet that is just what it has failed to do, and what Gödel showed it fundamentally incapable of doing. It is nothing less than that which constituted the core of his original paper, with the forbidding title "On Formally Undecidable Propositions of Principia Mathematica and Related Systems". All this germinated in the mind of the young member of the Vienna Circle. When events shattered that distinguished group, Princeton came to the rescue, and Harvard acclaimed Kurt Godel at his true stature.

The authors of the present book begin by discussing the problem and absolute proofs of consistency, giving an example wherein such a proof is successful. This entails, *en route*, the systematic codification of formal logic. A reader with some little competence in the sentential and existential calculus will have no particular difficulty in following the train of thought thus far. Then comes the idea of mapping, and its use in mathematics. It is exactly here that the power of Godel is so remarkable. We are familiar with the processes of projective geometry, or those involving the theorem of Pappus, wherein an abstract structure of relations in a domain (A) can be mirrored as holding in another domain (B). (In this particular case the transform is between points and lines.) What Gödel did was to map statements 'about' arithmetic as expressions 'in' arithmetic. In other words, he managed to project the meta-mathematics of arithmetic upon arithmetic itself. This method amounts in effect to making meaningful statements about a formalized mathematical system; it says something about mathematics, but plainly not belonging to it. Meta-language and meta-science sometimes present difficulties to the British way of thinking. Perhaps a very crude analogy would be the distinction between history and historiography, which is well accepted among scholars.

The end-result of Gödel's achievement is that arithmetic is incomplete. The way in which this remarkable conclusion is reached is by proving that there is at least one mathematical truth which cannot be said to follow from the axioms, and yet can be established meta-mathematically from outside.

We are thus faced with severe limitations in the whole axiomatic method itself, and everything built upon it. One cannot specify once for all a fixed set of axioms to shore up and bear the whole load.

There is, as the authors point out in a significant footnote (pp. 99–100), a throw-back to a type of Platonic realism. Gödel would seem to accept the existence of classes and concepts as real objects whether in fact we have 'realized' them or not. This may have wide repercussions, for it may prove to be in line with Heisenberg's primordial matter (after the manner of Anaximander), which he considers may be needed to extricate the quantum theory from its present philosophical confusion. Supposedly, such an entity would exist independently of our thoughts about it.

For what is little more than an essay on a vast subject, the writers have done astonishingly well. The proof-reading must have been as near faultless as human frailty can accomplish, since a minor misprint in such a strange land would lead many a careful inquirer to despair. To make Gödel's theorem more accessible is something supremely worth while, and this book is the way to do it.

F. I. G. Rawlins

ORGANIZATION AND METHODS

Organization and Methods

A Service to Management. Edited by G. E. Milward. Pp. xxxii+408+4 plates. (London: Macmillan and Co., Ltd.; New York: St. Martin's Press, Inc., 1959.) 63*s*. net.

THIS is essentially a practical book and gives the essence of the experience in organization and methods work of nine large commercial companies. Mr. Milward has done an excellent job in producing such a readable volume and one which does not show evidence of its rather mixed parentage. As one completely untrained in office management, yet who has had to accept responsibility for the many 'administrative' aspects of a large scientific institution, I can testify to the value of organization and methods procedures as described in this book in simplifying and often in reducing the ever-increasing paper work.

The book is concerned essentially with the practice of "Organization and Methods", the types of people required to carry out its procedures, their training and methods of working. It does not ignore the human factors which form such an important part in the operation of any organization. Its range is from the setting-up of an organization and methods department to information about types of office machines and their efficient use, and even to some matters of detail such as the optimum size for an office desk. In these days, when there is such a plethora of office machines and office systems on offer, it is extremely valuable to have, in convenient form, the product of the experience of leading companies.

A feature of the book which is claimed to be unique is a chart on the field of office machinery. This sets out diagrammatically the seven basic clerical operations and the machines which carry out or assist them, while the pros and cons of mechanization are discussed in the text. There is much in this book of interest and value not only to the managers of large commercial offices but also to those who have to incorporate in their organizations or institutions some efficient system of collection of data, record-keeping, ordering, etc. The index does not do justice to the book—especially one on this subject. For example, 'Pros and cons of mechanization' is indexed under '*P*', with no reference under '*M*'; 'Glossary of arithmetical terms' is under '*G*', with no reference under '*A*', and so on.

E. S. Hiscocks

SHORT REVIEWS

Alan M. Turing

By Sara Turing. Pp. xiv + 157 + 7 plates. (Cambridge: W. Heffer and Son, Ltd., 1959.) 21*s*. net.

FRIENDS and acquaintances of the late Dr. A. M. Turing, as also a much wider circle who only knew him through his published work, will welcome this succinct and timely biography by his mother, Mrs. Sara Turing. Alan M. Turing, who died in tragic circumstances in 1954, in his forty-second year, had already gained wide recognition for his work in mathematics, computing theory and machine design, and for a novel physico-chemical theory of morphogenesis; and, on the evidence, he was still on the flood-tide of even more remarkable achievements. Unfortunately, this was not to be.

Now, in this readable volume, presented with admirable detachment and singularly unmarred by the excess of sympathy which might well have crept in, we have an outline sketch of a very remarkable, and original, if sometimes wayward personality, direct, friendly, whimsical, and generous to a degree. Talent may be said to be the mainstay of academic life; but his contemporaries recognized that Turing had that very much rarer quality—genius. How much genius it is not possible to assess at this stage. Hence the value of this biographical memoir; for as Lyn Irvine (Mrs. M. H. A. Newman) has indicated in a percipient foreword, this is a source-book for future biographers, especially those who are concerned with the nature and manifestation of genius.

A Source Book in Greek Science

By Prof. Morris R. Cohen and Dr. I. E. Drabkin. Second printing, with corrections. (Source Books in the History of the Sciences.) Pp. xxi + 581. (Cambridge, Mass.: Harvard University Press; London: Oxford University Press, 1958.) 60*s*. net.

IT is interesting to see that this well-known work, which first appeared in 1948 from the McGraw-Hill Book Co., has been taken over by the Harvard University Press and is distributed in Britain by the Oxford University Press; and it is to be hoped that the other volumes in this excellent series are to be made similarly available in the near future. The great value of the book has always lain in its making immediately available, to students of the history of science and to other interested readers, English versions of Greek scientific literature that they would otherwise have to seek through many volumes in a library of considerable size; and it has another importance as a corrective of the partial and narrow view that scientific thought began in the seventeenth century. These six hundred pages of extracts on mathematics, astronomy, geography, physics, chemistry, technology, geology, meteorology, biology, medicine, physiology and psychology, with easy reference through a detailed table of contents, place at the reader's disposal a wealth of scientific literature and information that ranges through ten centuries. The comments connecting the extracts and the notes on the extracts have been well prepared, and the illustrations are suitably chosen.

Two impressions of Greek science that the reader gets from a critical survey of these extracts are very clear, namely, the preponderance of mathematics and the lack of understanding of experimental science. One could say with confidence not so long ago that in these joint respects Greek science differed much from that of our own time, but to-day one may be allowed to wonder whether there are not some scientific activities that have recently resumed these ancient characteristics.

Robert Boyle

Father of Chemistry. By Dr. Roger Pilkington. Pp. 179. (London: John Murray (Publishers), Ltd., 1959.) 18*s*. net.

ALL scientists know Boyle's Law, and many are aware of Boyle's work on combustion and respiration and his critical approach to chemical theory. But how many know that the author of "The Sceptical Chymist" wrote a religious romance and financed the translation of the Bible into the language of the North American Indians?

Dr. Roger Pilkington gives a balanced account of all aspects of this remarkable man's life and character. Boyle's chemical heritage is well described, and his scientific work is described as fully as possible in a short book, but more might have been said about the work and opinions of his contemporaries and the consequences of his discoveries and theories. This would have been particularly useful to readers unfamiliar with the history of science. If such a chapter can be added to a future edition it will enhance the value of a well-written book that can be read with profit by all who are interested in the men behind the scientific laws and theories.

W. A. SMEATON

Structure and Function of Genetic Elements

Report of Symposium held June 1–3, 1959. (Brookhaven Symposia in Biology, No. 12.) Pp. v + 187. (Upton, New York: Brookhaven National Laboratory, 1959. Available from Office of Technical Services, Department of Commerce, Washington, 25.) 2 dollars.

THE Brookhaven symposia on biology are sponsored by the Department of Biology of the Brookhaven National Laboratory. The twelfth symposium was held during June 1–3, 1959, and was devoted to the topic of the structure and function of genetic elements. The object of the symposium was to bring together the several points of view of the physical chemist, the biochemist, the geneticist, the cytologist, and the cytochemist. There are fourteen papers in all, covering these disciplines. All are valuable and important, and almost as valuable as the papers are the full reports of discussions and comments by the participants.

The subjects dealt with are: (1) Structural aspects of nucleic acids; (2) Biochemical activities of nucleic acids; (3) Genes; (4) Genetic transfers by viruses; (5) Structure and duplication of chromosomes; and (6) Nuclear-cytoplasmic relationships.

The results presented at this symposium may be compared with those of eight years ago at the fourth Brookhaven symposium, on a similar theme, the chemistry and physiology of the nucleus. It is clear that considerable advances have been made in our knowledge of the structure and function of the genetic elements. This is in some part due to improved techniques in the various areas of study. Autoradiography is, for example, extensively employed to help solve the problem of how chromosomes duplicate themselves.

Among the most valuable contributions are those of a general nature, for example, those concerning the present position of the coding problem (Crick), the present status of the adaptor hypothesis (Hoagland) and a comparative view of the chromosome (Steffenson).

Light touches are provided by Crick—"Hinshelwood once suggested a code dependent on the sugar but I never understood what he meant", and Zamenhof—"Could it be that all these things are not gene determined ? Or could it be that there is some information also in the sugar, God forbid ?"

S. C. HARLAND

Blindness in West Africa

By Prof. F. C. Rodger. Pp. xiv+262+1 plate+6 maps and 96 text figures. (London: H. K. Lewis and Co., Ltd., 1959. Published for the Royal Commonwealth Society for the Blind.) 70*s*. net.

IN Great Britain there are about two certified blind persons in every 1,000 of the population. A report from thirty-nine Commonwealth and Colonial territories has given a figure of about eight blind per 1,000, with far the largest numbers in West Africa.

This book records the findings of a survey in Nigeria, North Ghana and the Cameroons, and Prof. Rodger, allowing for factors like visual standards, assesses the overall figure of blindness as about 1 per cent of the population with the figure much higher than this in North Ghana, where onchocerciasis, a generalized infestation by a fly-borne filarial worm, is very severe. The countries, the people and their eye diseases are all reported upon, and, while much is technical, Prof. Rodger has presented his material so that a lay person will find interest in it. Eye disease among children was especially investigated and considerable attention paid to nutritional standards. The report is objective and parts make gloomy reading, for much of the blindness arising from infection (purulent smallpox, syphilis, etc.) and malnutrition is preventable. Trachoma, the cause of the greatest number of blind, is now amenable to treatment, and may perhaps be eradicated before too long ; but the elimination of filarial worm disease remains a problem to be solved.

The production of the book is good, though the illustrations vary a lot in quality.

R. C. DAVENPORT

The Hand of Life

The Story of the Weizmann Institute. By Ritchie Calder. Pp. 78+65 plates. (London: Weidenfeld and Nicolson, 1959.) 30*s*. net.

IN 1934 the Daniel Sieff Institute was established in the desert at Rehovoth, Israel, as a memorial to the son of Mr. and Mrs. Israel Sieff and the nephew of Sir Simon Marks. The memorial had been suggested by Dr. Chaim Weizmann, the distinguished chemist who became the first president of Israel. Ten years ago the Weizmann Institute was also founded at Rehovoth and, to mark both occasions, Ritchie Calder has produced a tribute worthy of the magnificent buildings and gardens which now flourish in a place where twenty-five years ago there stood nothing but sand. This handsome book describes some of the outstanding investigations which have been made at both Institutes and also contains a series of photographs which give a clear impression of what life is like for those who live and work at Rehovoth ; their scientific investigations are a worthy memorial to Sieff and Weizmann.

Paths Across the Earth

By Lorus and Margery Milne. Pp. xi+216. (London: Cassell and Co., Ltd., 1959.) 16*s*. net.

IT is unfortunate that the wrapper should tell us that the authors, two American zoologists, have "travelled together from the Arctic to the Equator to try to solve such problems", because they say little at first hand and nothing new. The book is in fact a popular account of the migratory movements of animals, presented in chapters devoted to general aspects or questions ; New World examples naturally predominate. It should be interesting to readers coming fresh to the subject and willing to accept a degree of arbitrary simplification. There are, however, surprising omissions ; for example, Kramer is not mentioned among seven authorities named in respect of bird navigation ; there is no reference to the regular annual movements of some African antelopes—indeed almost an implication that such do not occur ; and a section on echo-location contains, in that regard, only a vague statement about mice and none of the precise information available for bats, cetaceans and certain birds. There are also definite errors ; for example, it is the reverse of true to say that ringing has shown that the majority of British native starlings do not remain throughout the year but migrate towards the Mediterranean ; and it is not the case that the cattle egret has shown no recent range expansion in the Old World comparable with its spread to and in the Americas.

LANDSBOROUGH THOMSON

Handbook of Toxicology

Vol. 5: Fungicides. Analysis and Compilation by Everett F. Davis, Barbara L. Tuma and Lucy C. Lee. Edited by Dorothy S. Dittmer. Prepared under the direction of the Committee on the Handbook of Biological Data, Division of Biology and Agriculture, National Academy of Sciences—National Research Council. Pp. ix+242. (Philadelphia and London: W. B. Saunders Company, 1959.) 38*s*. 6*d*. net.

THIS volume lists 196 substances known to destroy fungi or to inhibit their growth and reproduction. For each the structural formula, physical and chemical properties, tests (*in vitro*, *in vivo* or both), toxicity to man and animals, and use are given. Authorities for this information are included in the bibliography of 326 titles, and patent numbers (United States and others) for 112 of the 196 substances are listed in Appendix i. Appendix ii lists 500 other substances, refers to references to them in the general bibliography, but gives no other information. This should be a useful reference work for those advising on the use of fungicides in industry and agriculture.

Agricultural Insects of East Africa

Compiled by R. H. Le Pelley. Pp. x+307. (Nairobi: East Africa High Commission, 1959.) 42*s*.

ENTOMOLOGISTS and agriculturalists in many tropical countries, particularly in Africa, have been greatly handicapped because they have not been able to refer to authoritative lists giving the names of insects recorded there. A great deal of the information required has been collected by Government entomologists, and has been buried in departmental files. Dr. Le Pelley has performed a useful service in bringing together in this book so many records of insects and mites associated with plants in Kenya, Uganda, Tanganyika and Zanzibar; workers here, in adjacent territories and even in other parts of tropical and sub-tropical Africa, will find the lists invaluable. Parasites, predators and stored products insects are included, with the original reference to the publication first giving their occurrence. A list like this cannot but be incomplete, as its author would be the first to point out; but he is to be sincerely congratulated on his success in including so many records others would not have unearthed.

The title, "Agricultural Insects of East Africa", may mislead. This book contains only a list of names of insects and plants. It does not give any descriptions of the animals, or of their importance in agriculture. It is a very valuable work as it stands, and it is perhaps unfortunate that the title does not make its nature more obvious.

Kenneth Mellanby

A Laboratory and Field Manual of Ornithology

By Olin Sewall Pettingill, Jr. Third edition, second printing. Pp. viii+279. (Minneapolis: Burgess Publishing Company; London: Mayflower Publishing Co., Ltd., 1958.) 40*s*.

IN recent years ornithology has become increasingly respectable among contemporary sciences without losing its place as a source of casual interest and amusement. This status has been achieved to a large extent by improvements in standards of teaching as reflected in such books as this laboratory and field manual. In Britain it seems difficult to isolate ornithology as a special subject in the curricula of secondary schools and universities, and teaching is confined mainly to extra-mural environments. But in the United States, apparently, this difficulty is not felt to the same extent, for Prof. Pettingill's manual is based on notes for lectures at high schools and colleges. The text consists of explanatory material and directions for study, including lines of research for advanced students. Although retaining the form and structure of lecturer's notes (it is a photo-offset reproduction of typescript) it is a valuable source of useful information on most aspects of bird biology.

J. D. Macdonald

The Buzzard

Text and Photographs by Frank Wenzel. Translated from the Danish by Reginald Spink. Pp. 86. (London: George Allen and Unwin, Ltd., 1959.) 35*s*. net.

THIS book from Denmark, written and illustrated by Frank Wenzel, is a fine example of bird photography. Its illustrations from photographs in colour and in black-and-white include many superb pictures, some of remarkable dramatic quality, for example the colour plate facing p. 80. This shows a buzzard balancing itself with extended wings held aloft on a swaying branch. The bird is silhouetted against a stormy sky with a dazzling sun gleaming from between the clouds. Another pleasing picture is the portrait of a buzzard facing p. 73. It shows a remarkably light-coloured bird in a green woodland setting and it reminds us how this species varies in colour and markings. A little farther on is a photograph of a very dark male, with plumage of deep sooty brown, indeed almost black.

The letterpress is comparatively slight; but it is based on first-hand observations, telling of the author's experiences among the buzzards of his native Denmark. He gives us many exciting descriptions of its woods, heaths and marshes. He tells how he built a hide in a tree from which he could see into a buzzard's nest in a neighbouring tree; he adds he thought it desirable to ensconce himself in it under cover of darkness, though to do so he had to walk through the night-time woods. "Moonlight makes everything change character," he says. "Things well known in daylight now appear quite unfamiliar. Tree trunks look like dark figures throwing long mysterious shadows in the undergrowth; harmless stumps are transformed into witches and ogres. The silence was broken over by the bog. There was a strange purring and whirring noise . . . it was the phantom nightjar filling the night with magic and mystery."

This volume would make a fine present for any young person with aspirations to use his camera in the portrayal of birds.

Frances Pitt

Diseases of Farm Crops

By A. Beaumont. Pp. 128+48 photographs. (London: W. H. and L. Collingridge, Ltd., 1959.) 25*s*. net.

THE farmers and agricultural students for whom the author intends this companion volume to his "Diseases of Garden Plants" will be glad that it is written so clearly, with so few scientific terms and generously illustrated by photographs nearly all of which show what is intended. Readers better versed in plant pathology will recognize that most of the recent work is mentioned in summaries of the major diseases. The author is realistic about the importance of diseases, and the control measures necessary or practical; he emphasizes the effects of crop rotation and has added many cautionary notes born of his long experience as an advisory plant pathologist.

Because much of it is good, the weaker parts of the book stand out starkly. The arrangement of diseases under crops and the organs attacked makes reference easy, but leads to much repetition which could be avoided by tabulation or some grouping of closely related hosts. The too-simple section on naming and recognition of diseases, the many notes on rare fungi and, for example, the 15 references under marrow stem kale which contain little more than notes of frequency and cross-references, all make one wish the author had used this space to expand the sections on principles and major diseases.

J. M. Hirst

A Handbook of West African Flowers

By Harold N. Saunders. Pp. 124. (London: Oxford University Press, 1958.) 5*s*.

IT is not an easy task to select the commonest plants in an area, and the larger the area the more difficult it becomes. When the area is West Africa from Gambia to Nigeria, with a flora of several thousand species, no selection within reasonable limits can hope to satisfy everybody everywhere. Nevertheless this attractive little book has courageously attempted the task, and the result is both creditable and useful. Within the limits of no more than 124 pages, 364 species are briefly described, and small, simple, clear illustrations of 120 of them are fitted in, four to a page. In addition there are a glossary and an ingenious numerical key, which the user after some practice should find helpful. A word of warning to the user to read *all* the choices in each column on pages 108 and 109, before deciding which one fits his plant best, is, I think, desirable. Hitherto there has been no pocket-book of West African flowers for the beginner. Now, for as little as five shillings, there is, and I hope that this book will start to perform its most valuable function of arousing interest and intelligent observation of what is growing round them among those people previously daunted by the learned and weighty scientific works, from which alone hitherto the name of the commonest West African roadside weed might be laboriously extracted. J. P. M. Brenan

Miocene Floras of the Columbia Plateau

Part 1: Composition and Interpretation. By Ralph W. Chaney. Part 2: Systematic Considerations. By Ralph W. Chaney and Daniel I. Axelrod. Pp. viii+237+44 plates. (Publication No. 617.) (Washington, D.C.: Carnegie Institution of Washington, 1959.) 4.25 dollars; Cloth bound 4.75 dollars.

This excellent and comprehensive review of the Middle to Late Tertiary floras of the Western United States is for the most part a revision and synthesis of the research work carried out in the University of California by Emeritus Prof. Ralph Chaney and Dr. D. I. Axelrod, who have contributed many papers on this subject covering a period of more than forty years. The results of their research and that of earlier workers on the composition of the floras is brought together and from the result of this synthesis deductions are made as to the ecological and climatic features under which the floras existed. As an example, they find evidence that as a result of the increasing altitude of the Cascade Range during the Pliocene the conditions became drier and hotter and many constituent types of plant disappeared; whereas on the eastern sides of Asia and North America where the climates have remained moister these types still persist as constituents of the floras.

The second part of the review consists of what is in essence a catalogue raisonné of the fossils. These are well illustrated in the plates and there are also photographs of present-day vegetation in the United States for comparison with that of the Tertiary.

J. Walton

Memoirs of the Geological Survey of Great Britain

Palæontology, Vol. 4, Part 2: Fossil Plants of the Carboniferous Rocks of Great Britain. By Dr. Robert Crookall. Second edition. Pp. iv+85–216+plates 25–58. (London: H.M. Stationery Office, 1959.) 110*s*. net.

The Geological Survey of Great Britain is publishing a complete account of the Coal-measure plants of Great Britain. This work represents the second part of the series on palæontology of which the first (pages 1–84) appeared in 1955. Like its predecessors it gives references exhaustively; descriptions are full and amply illustrated by photographs. The photographs indeed repay study with a fairly strong hand lens; structures 0·1 mm. apart can just be resolved. It is very like the memoirs being produced elsewhere on the same subject; as far as I can judge, the work is of equal completeness and quality, though the paper and margins may be less sumptuous. Like them, it seems written mainly for the geologist who has to correlate a rock by means of its fossil plants, and what is more, does it by the well-tried hand-lens methods. In the course of being complete, the present volume mentions microscopic work done by others, but does not add to it. If the botanically minded fossil botanist wants such information, he can determine his plant here, but then do all his own work. The treatment is conservative; the several subgenera used by some are rejected and though new species are made, their numbers are moderate. The only really adverse criticism to be made is at the very slow production. Kidston's Volume 1 of the series is dated 1923–25.

T. M. Harris

Strahlenbiologie

Grundlagen und Ergebnisse. Von Prof. Dr. Hedi Fritz-Niggli. Pp. xvi+379. (Stuttgart: Georg Thieme Verlag, 1959.) 65 D.M.

Prof. Fritz-Niggli deserves congratulation for a masterly review, with 28 pages of references, of a subject that is difficult to make into a logically coherent whole. Though the reader is left feeling that the core of the subject, the cause of radiobiological damage, is as mysterious as ever, that is not the fault of the author. A further feeling, surprising and depressing, results from the author's painstaking historical research; this is that many of the facts that became familiar during the post-bomb wave of radiobiological research were just as familiar during the post-X-ray-radium wave at the beginning of the century. Good examples are the effects on blood cells and embryos, which were studied in amazing detail between 1903 and 1908.

A commendable feature of the book is that each branch of the subject is introduced with a short sketch of the basic knowledge needed to follow it; but the reader's education is rather peculiar. He is told that the atoms in a gram of hydrogen if placed end-to-end would stretch 76 times round the Earth's solar orbit, that proteins have large molecular weights and that nucleic acids are biologically important; but it is assumed that he knows how to distinguish a gynogenetic from an androgenetic haploid habrobracon. Fortunately his knowledge of histology is assumed to be imperfect; he is shown normal pictures for comparison with the abnormal. The book is attractively written and printed, with good illustrations and plenty of tables and ingenious but rather brain-twisting diagrams.

Die Aktivierte Essigsäure

Das Coenzym A und seine Acylderivate im Stoffwechsel der Zelle. Von Dr. Karl Decker. (Sammlung Chemischer und Chemisch-technischer Beiträge, Neue Folge, Nr. 57.) Pp. viii+300. (Stuttgart: Ferdinand Enke Verlag, 1959.) Ganzleinen 74.80 D.M.

The index of this monograph might almost be that of a general text-book of biochemistry: so wide-spread are the functions of coenzyme *A*. It is difficult to realize that this coenzyme was discovered only about ten years ago and that the mass of fundamental knowledge described in this book was mostly gained within that short time. Coenzyme *A* is a catalyst which is built up in the body from pantothenic acid, one of the vitamins of the B complex. It acts as a carrier of acid groups, particularly acetate; the acid, when combined as a thiol ester with the coenzyme, can take part in reactions which do not occur with the free acid. The acetyl derivative of coenzyme *A* ('activated acetic acid') is a key intermediate substance in the body, for it is on the direct pathway for the metabolism of carbohydrate and fat. It is involved in many other important biochemical processes such as the synthesis of cholesterol, the acetylation of drugs like the sulphonamides and the formation of acetylcholine, one of the chemical transmitters of nerve activity.

All these, and many other functions of the coenzyme, are described and fully documented. The early chapters deal with the events leading to its discovery, and with its preparation, properties and estimation. The information is well set out, much of it in tabular form, and the literature is covered up to and including 1958. It may be worth mentioning that the high cost of materials for present-day biochemical research is not only due to the need for expensive isotopes, for the cost of a gram of commercial coenzyme *A* runs into hundreds of pounds. Beside this, the cost of the book may not seem so high. It is very useful to have all this information collected together and the book should be in every biochemical library. D. C. HARRISON

Tables of Physical and Chemical Constants and some Mathematical Functions

By Dr. G. W. C. Kaye and Dr. T. H. Laby. Prepared under the direction of an Editorial Committee. Twelfth edition. Pp. viii+231. (London: Longmans, Green and Co., Ltd., 1959.) 25*s*. net.

THE latest edition of this admirable book is, like its predecessors, an outstanding work of reference of which its editorial board and contributors can be justly proud. So many complimentary things have been said in the past about previous editions that it is difficult to add anything more. Suffice it to say that the present edition more than maintains its great tradition for accuracy and clearness in the presentation of the abundant data, and that it remains an indispensable book for all students of physics and chemistry and their teachers.

The tables have been thoroughly revised and brought up to date, and certain sections, like radioactive and stable isotopes, have been extended to bring them into line with modern times, while the general atomic constants have been entirely recalculated.

Extensive changes have also been made in the chemistry section, in particular with chemical thermodynamics and electro-chemistry, while in the physics section the main revisions have been under the headings time, elasticity, full radiation and atomic physics. But in spite of the inevitable changes and modifications, this edition has the same essential features as before. It is still "Kaye and Laby", the friend and guide of countless numbers of students of successive generations, for it continues to be a completely reliable source of an amazing amount of essential material expressed so clearly, concisely and accurately. T. M. YARWOOD

Atomic Terminology

A Dictionary of Nuclear Science, Engineering and Technology in Four Languages (English–German–French–Italian). Compiled by Lore Lettenmeyer. (Die Fremdsprachen in der Praxis, Reihe B, Band 1.) Pp. 298. (München: Isar Verlag; London: Temple Press, Ltd., 1958.) 42*s*. net.

WITHIN the limits of its scope, "Atomic Terminology" is a model of what a multilingual dictionary should be. In the main part of the work, where the order is English alphabetical, each of the 1814 entries is given a number; this number is repeated before the German, French and Italian equivalents, and is also used in the indexes in each of these three languages. English synonyms are listed together, but each appears also in its alphabetical place with a cross-reference. The fact that the number of synonyms is, on occasion, as many as thirteen indicates the thoroughness with which the compilation has been carried out.

The keeping of the dictionary to pocket size has naturally imposed limitations: there are no definitions, and no information about sources, so that the user cannot tell *a priori* which forms are in common use and which, if any, have been coined by the compiler. Nevertheless, the general impression is one of careful and reliable lexicography, and this is confirmed by the extreme paucity of obvious errors: half a dozen misspellings such as 'Cockroft', and as many terminological inexactitudes such as 'restricted theory of relativity', in almost 300 pages. Dr. Lettenmeyer's valuable work is to be warmly recommended to all who have occasion to seek quick reference to correct equivalents of terms in the field of nuclear energy. J. B. SYKES

Electromagnetic Phenomena in Cosmical Physics

Edited by B. Lehnert. (International Astronomical Union Symposium No. 6, held in Stockholm, August 1956.) Pp. xiii+545. (Cambridge: At the University Press, 1958.) 50*s*. net.

THIS volume testifies to the increasing interest in electromagnetic phenomena which has characterized research in cosmical physics during the past decade. It is a subject in which simultaneous development and combination of theoretical, experimental and observational work are necessary, and this is reflected in the topics discussed at the symposium. Part 1 is devoted to magneto-hydrodynamics, and both theory and laboratory work are discussed. The paper by W. H. Bostick on the experimental study of plasmoids is of especial interest.

Part 2 is devoted to solar electrodynamics, Part 3 to stellar magnetism and Part 4 to solar and interplanetary magnetic fields. The papers in these three parts give a good indication of the importance of electrodynamic phenomena in astrophysics. It is not surprising that in this very live field few of the papers reach final conclusions, and they serve to emphasize how little we really know about the phenomena.

Part 5 is mainly concerned with cosmic rays, Part 6 with high current discharges and Part 7 contains a number of additional contributions on various subjects. From the vigorous discussions after the papers it is clear that the symposium was a success and of much benefit to the experts. The casual reader will not find this collection of papers suitable for general reading, and must await the production of a more systematic treatment of the subject.

R. H. GARSTANG

Nuclear Reactor Physics

By Prof. Raymond L. Murray. Pp. xi+317. (London: Macmillan and Co., Ltd., 1959.) 30*s*. net.

THIS is a reprint of the 1957 American edition and therefore contains no references to developments since 1956. It presents a clear and concise introduction to the basic equations and physical concepts, and its reappearance at a price which is now within reach of the student is to be welcomed. The author covers the basic areas of reactor physics, starting with those problems for which simple mathematical models provide an adequate approximation, and develops the power of the mathematical techniques as the book proceeds and as they are needed to cover the later, more complex, problems.

A feature of the text is the illustration of each development of the theory by applying it to a specific physical problem; a list of problems is also provided at the end of each chapter. These provide a very effective technique for showing the student what can be done with the theory.

The reader should, however, note that although this book is an excellent elementary text, the use of modern high-speed computing machines has meant that the calculation procedures currently in use for the solution of reactor problems differ appreciably from those described in Prof. Murray's book.

J. Fell

Physics and Mathematics

Vol. 3. Edited by Donald J. Hughes, J. E. Sanders and J. Horowitz. (Progress in Nuclear Energy, Series 1.) Pp. viii+403+xii. (London and New York: Pergamon Press, 1959.) 105*s*. net.

THE second (1958) Geneva Conference on the Peaceful Uses of Atomic Energy differed from the first in that the declassification of much of the early work was complete, and so attention was concentrated more on critical appraisal and interpretation, rather than on the mere presentation of data.

This third volume in the series "Physics and Mathematics" contains a selection of some twenty-one papers considered by the editors to be the most significant contributions to the dozen or so sessions on the physics of atomic energy. There can be no doubt that several of the papers, which cover the fields of neutron cross-section measurement, the physics of fission, neutron thermalization theory, and other aspects of reactor physics, are of great significance. For example, Leachman's paper on "The Fission Process" fills a very definite need for a readable review of recent data and theories on this controversial subject.

It can inevitably be argued that certain papers have been included the fields of which are too narrow, and that other, possibly better, papers have been excluded. It is the opinion of this reviewer, however, that the volume contains a selection of papers which will form a most useful reference work for any physicist interested in the more fundamental aspects of reactor physics.

E. R. Rae

A Student's Introduction to Physics

By Franklin Miller, Jr. Pp. xv+608. (London: Routledge and Kegan Paul, Ltd., 1959.) 50*s*. net.

THE author of this copiously illustrated text-book believes that all students can, and should, be familiar with the basic principles of physics, and accordingly he covers the whole field from its nature to the structure of the atom and nuclear energy.

The student requires no mathematics beyond simple algebra, and principles are emphasized rather than technological applications, though several of these are dealt with.

For a text in elementary physics there are several departures from the orthodox presentation. For example, the structure of the atom is introduced very early and students become acquainted with protons, electrons, neutrons and isotopes almost at the start. For a book of this scope I agree this is the correct approach, since there is no doubt much interest is taken nowadays by the ordinary student in anything pertaining to what is termed 'modern physics', and the early introduction must act as a stimulus to learn more about the principles of classical physics.

Another sensible innovation is the elimination of all reference to conventional positive current; the text deals only with direction as indicated by the electron flow.

Metric and f.p.s. units are used in mechanics, but only M.K.S. units are used in the section on electricity and atomic physics, thus keeping in line with modern practice.

Many worked examples, questions and problems are included in the book; the text, supported with many diagrams and illustrations, is well written and thoroughly done and it should certainly fulfil the aim of its author.

T. M. Yarwood

Analyse de Variance et Plans d'Expérience

Par Prof. Daniel Dugué et Prof. Maurice Girault. (Probabilités Statistique—Recherche Opérationnelle. Section B: Statistique Mathématique.) Pp. xiii+68. (Paris: Dunod, 1959.) 800 francs.

THIS short book gives a compact account of the elements of analysis of variance and experimental design. By English standards, its compounding of very elementary ideas on standard distributions and models with methods for design construction based upon Galois fields and vector spaces reads strangely; however, this book appears to be a successful execution of this intention. Necessarily the limitation of length prevents adequate critical discussion of the ways in which the designs should be used. Ascription of the distribution of the ratio of two independent χ^2 variates to 'Behrens–Fisher' is surprising.

D. J. Finney

Between Earth and Space

By Dr. Clyde Orr, Jr. Pp. ix+253+8 plates. (New York: The Macmillan Company, 1959.) 34*s*. 6*d*.

THE future of mankind has always been a concern of thinkers, the deleterious effects of Man's own activities having prompted many pamphlets. The substance of such a tractate might well be drawn from the last two chapters of this book. One of these deals with atmospheric pollution, and here, as might be expected from a chemist, Dr. Orr is at his best, the subject-matter being of higher quality than is suggested by such a poetic title as "A Ravaged Realm".

The twelve earlier chapters give a non-technical account of man's environment and its evolution. The presentation is more that of a popular lecture than that of a text-book and flows easily. As seems inherent in this type of treatment, there are statements as of fact which the specialist would accept only as possible hypotheses. The initiate is, however, not seriously misled, being shown a balanced picture with a spice of the more spectacular phenomena.

A selected reading list is given of some two hundred references from a wide variety of sources largely of a popular or semi-popular nature. This list is not classified, there is no reference to it in the text, nor is there any indication of which part of each reference is thought to be apposite. To pursue every reference would take even the most assiduous reader quite some time, an unduly heavy task to develop from an easily read book which itself supplies good light relaxation.

B. R. LEATON

Man's Conquest of the Stars

By Pierre Rousseau. Pp. 356. (London: Jarrolds, Publishers (London), Ltd., 1959.) 25*s*. net.

IN this book the author has attempted to show how the development of astronomical science has influenced, and been influenced by, human methods of thought. When primitive man first turned to agriculture he needed the stars to forecast the changes of the seasons. The sophisticated thinkers of the Greeks attempted to encase astronomy in their different philosophies—whether the perfect circles of Plato or the divine harmony of Pythagoras. When Europe was submerged by the Dark Ages, the Arabs maintained the study of astronomy, chiefly to ensure that the Moslem hours of prayer were accurately fixed. When the Renaissance dawned, the new discoveries of astronomy helped to break the chains that fettered human thought. In succeeding centuries the great explorations stimulated the study of navigation, and the industrial revolution made possible the construction of instruments of greater power and accuracy.

This history is fully developed in M. Rousseau's book; but the most powerful part is his discussion of the contribution of the seventeenth-century scientist-philosophers Descartes, Newton, and their contemporaries. They invented methods which led directly to the 'scientific method' as we understand it to-day. The author assesses the stature of each new school of astronomy by the closeness with which it adheres to this method.

It should not be thought from the above remarks that this is a closely reasoned philosophical treatment—the style is racy and frequently enlivened by anecdotes. However, this style is virtually irreconcilable with spherical astronomy, which is made unnecessarily obscure in comparison with the rest of the book.

D. H. P. JONES

Astronomy

A Textbook for University and College Students. By Dr. Robert H. Baker. Seventh edition. Pp. viii + 547. (Princeton, N.J.: D. Van Nostrand Company, Inc.; London: D. Van Nostrand Company, Ltd., 1959.) 52*s*. 6*d*.

THIS work is an excellent descriptive handbook of modern astronomy and astrophysics. It is the seventh edition of a book originally published in 1930, but has been completely rewritten and embraces all new developments up to 1958. However, it is not encyclopædic in approach; the author has been at pains to describe the context as well as the content of each section so that the subject appears as an organic whole. Thus radio-astronomy appears not as a self-contained unit but as the means for demonstrating the spiral nature of our galaxy, the size of which is known from optical means. The photo-electric measurement of the apparent brightnesses of stars is shown to lend a greater precision to the cosmic distance scale. Earth satellites had not made much direct contribution to astronomy at the time of publication, and they receive a correspondingly small mention.

All this information is conveyed in a lively and lucid style and there are plenty of really good photographs. Line diagrams are often used to illustrate more obscure points. In the preface the author states that no special knowledge of mathematics or physics is required; this rather vitiates its value as a university text-book. However, it would make a good reference to the descriptive part of a general course in astronomy as well as being an intelligible introduction for the layman.

D. H. P. JONES

The Sun and Its Influence

An Introduction to the Study of Solar-Terrestrial Relations. By Prof. M. A. Ellison. Second edition (revised). Pp. xiv + 237 + 9 plates. (London: Routledge and Kegan Paul, Ltd., 1959.) 25*s*. net.

THE second edition of Prof. Ellison's book is the same as the first except for a few corrections and an added description of the solar cosmic ray event of February 23, 1956. The book is an authoritative factual description of solar activity and its terrestrial effects. It is written for the general reader, but provides a stimulating narrative for students or workers interested in any of the phenomena operating between the Sun and the Earth. The solar problems studied are the solar atmosphere, solar radiation, radio emission and various aspects of the solar cycle. Special attention is given to solar flares. The main terrestrial effects are to be found in the ionosphere, the Earth's magnetism, and auroræ.

C. W. ALLEN

A Concrete Approach to Abstract Algebra

By Prof. W. W. Sawyer. Pp. v + 233. (San Francisco: W. H. Freeman and Co.; London: Bailey Bros. and Swinfen, Ltd., 1959.) 1.25 dollars; 10*s*. 6*d*. (paperbound).

IN abstract algebra, the novice is sometimes perplexed by the contrast between the almost ludicrous simplicity of the techniques and the profundity of the concepts, and may accept the logic of a modern text without acquiring any real grasp of the subject. To help him, Prof. Sawyer begins with a simple concrete model: a child with no arithmetic and no English, placed in an English schoolroom, might soon learn to associate the responses "four" and "six" with the teacher's demands, "Two and two make . . .", "Two times three is . . . ", and thus arrive at formal addition and multiplication tables without having any knowledge of the specific character of the elements to which these tables apply. By insistence on such concrete models, the author is able to emphasize the structure of an algebra, to deal with such topics as finite arithmetics, extensions of fields, and vector spaces, without inducing a feeling of unreality. A final good chapter shows how these notions can be applied to the familiar old problem of the trisection of an angle. Prof. Sawyer writes clearly and entertainingly: there are many non-mathematicians who want to know what modern mathematics is doing, and they will find this book helpful, though some references for further reading might well have been supplied.

Differential Geometry

By Prof. Erwin Kreyszig. (Mathematical Expositions, No. 11.) Pp. xiv + 352. (Toronto: University of Toronto Press; London: Oxford University Press, 1959.) 48s. net.

THE calm backwater of classical differential geometry was stirred up by the general theory of relativity and is now once more in the main stream: Prof. Kreyszig keeps within familiar euclidean space, but has in mind extensions to Riemannian geometry. He first deals with the curvature and torsion of a curve, defined rather artificially as normalizing factors for certain vectors associated with the curve, but quickly related to the more concrete notion of the components of the angular velocity of the fundamental orthogonal triad. Then he discusses the first and second ground forms for a surface and geodesic curvature, using tensor methods which are introduced and elaborated as they are needed. This part of the book gives the minimum which every mathematician must know, and Prof. Kreyszig has taken pains to make the argument both detailed and rigorous. For the rest of the book he selects certain more advanced topics of importance. There is a very good chapter on mapping, in which the unifying power of this concept is illustrated. Another chapter deals with Levi-Cività's parallel displacement as an introduction to the general theory. The final chapter covers a variety of special topics, such as minimal surfaces and surfaces of constant Gaussian curvature. Exercises for the student are interesting and not oppressively numerous. The teacher should find this book helpful because of the care with which topics have been chosen from a very wide field, and because of the skill with which analytical rigour and geometrical intuition have been mated.

Britain's National Parks

Edited by Harold M. Abrahams. Pp. 151 + 40 photographs. (London: Country Life, Ltd., 1959.) 25s. net.

WHEN the first British national park was designated ten years ago it was hoped, in Lord Birkett's words, that "the fairest places in these islands will be secure from all assault arising from accident or design". With ten parks created this has proved to be far from the truth, and those who administer the parks need all the support they can get to resist the encroacher, both private and public.

This beautiful book, made up of a series of articles by men and women who know their parks lovingly and intimately, supported by photographs of the quality one expects from the publisher, should encourage all readers to join the ranks of those who see to it that encroachments are not made without due cause.

British Industries and Their Organization

By Prof. G. C. Allen. Fourth edition. Pp. xi + 332. (London: Longmans, Green and Co., Ltd., 1959.) 25s. net.

IN this edition Prof. Allen has largely re-written his book, which was first published in 1933 and substantially revised in 1951. The first chapter, which is substantially unaltered, traces the chief features of British industrial growth up to 1914, and the second chapter, much enlarged, outlines the economic history of the period from 1914 to 1959, so far as is relevant to the main theme of the book. The remaining ten chapters are concerned with particular industries; but, as in previous editions, the chemical and electrical industries are not included, and the book suffers a little in consequence. The select bibliography has also been completely revised.

R. BRIGHTMAN

Biographical Memoirs of the National Academy of Sciences of the United States of America

Vol. 33. Pp. vi + 484 + 16 plates. (New York: Columbia University Press; London: Oxford University Press, 1959.) 40s. net.

THE "Biographical Memoirs" of the U.S. National Academy of Sciences are the counterpart of the Obituary Notices of the Royal Society, and Vol. 33 worthily maintains the high standard. The memoirs it contains are noteworthy for the completeness of the bibliographies appended to each memoir, but the time-span is exceptional, ranging from Josiah Boyce (September 14, 1916) and M. C. Wood, jun. (January 3, 1920) to P. D. Merica (October 20, 1957), though apart from Dunham Jackson (1946) and T. H. Morgan (1945) the subjects of the remaining memoirs died between 1950 and 1957. Among the memoirs likely to be of the widest interest to British readers are those of Isaiah Bruman, R. A. Millikan and L. F. Small.

The Wealth of India

A Dictionary of Indian Raw Materials and Industrial Products. Raw Materials, Vol. 5: H–K. Pp. xxv + 332 + xii + 16 plates. (New Delhi: Council of Scientific and Industrial Research, 1959.) Rs. 30.

THE appearance of the fifth volume of this work will be welcomed, the first volume having appeared twelve years ago. According to the chief editor's introduction it is considered that half the total work has now been printed. With the machinery for the preparation of this gigantic task now apparently well organized and tried, it may be that the remaining five volumes will be completed in a shorter time. It would seem that the task may well take twenty years to complete. This is not unduly long, however, when one considers how long other similar large tasks, involving several authors, take to complete. For example, some of the large tropical floras now in preparation are unlikely to be completed in less than twenty or even thirty years.

This volume follows a similar pattern to the previous four volumes and contains a great deal of useful information presented in a form readily intelligible to the ordinary reader. It is well illustrated with line drawings, photographs and a few coloured plates. The coloured frontispiece is the sunflower (*Helianthus annuus*), which is, of course, of American origin. A typically Indian economic plant would perhaps have been more appropriate.

The volume deals with the raw materials falling under the letters H–K. It contains 380 entries—370 on plants, 7 on animals and 3 on minerals. The preponderance of plant raw materials, compared with animal and mineral, is no cause for surprise to those familiar with the amazing richness in economic plants which Nature has so generously bestowed upon the Indian sub-continent. Important products in this volume include—*Hevea* (rubber), *Hibiscus* (with several different economic plants), *Hordeum* (barley), *Hydnocarpus* (chaulmoogra oil), *Indigofera* (dyes), *Ipomoea* (sweet potato), jade, *Jasminum* (perfumes) and *Juglans* (walnut).

F. N. HOWES

(*Continued from p.* 34)

applied intermittently to the fine grains subjected to the 'grinding' actions in each of these types of apparatus.

That a real pressure component is operative in the action of the mortar assembly was shown by increasing or reducing the weight of the pestle-head assembly by means of a suitable weight or counterpoise to twice or one-sixth the normal weight. Thus, although about 20 per cent conversion of calcite to aragonite was achieved by only 13 hr. of grinding under normal weight, and about 5 per cent in the same time under half the normal weight, more than 100 hr. under the one-sixth weight failed to produce detectable amounts of aragonite. Presumably the greatly reduced weight of pestle is not sufficient to generate pressures greater than 3,000 bars on the calcite, leaving it still in its equilibrium field. Another example is the litharge–massicot transition of lead oxide in which litharge is the low-pressure (and also low-temperature) form. The action of the light-weight pestle (under nitrogen) will drive massicot readily to the stable litharge (this being merely the effect on kinetics due to bond breakage), but if litharge is the starting material no change to massicot is observed. To accomplish the latter the heavier pestle is necessary, presumably since only then is enough pressure available to reach the massicot field. On the other hand, the heavy pestle will produce some litharge when acting on massicot, because all values of pressure up to the maximum must be encountered, since the apparatus of necessity produces a whole 'spectrum' of pressures. A similar example was found on grinding a mixture of the senarmontite and valentinite forms of Sb_2O_3.

Thus it is clear that the stresses causing fracture generally operate to accelerate reactions, although the effect is larger in some pairs of structures than in others. Superimposed on this kinetic effect is a hydrostatic pressure effect. Detailed verification of the separability of the 'stress' and pressure effects has been effected[5] in an uniaxial high-pressure device[6] so modified that a slow continuous oscillating displacing shear action by the movement of one piston through 2° of arc is applied to samples (of the above compounds) simultaneously subjected to high pressures and temperatures. It is sufficient to mention here that it has been established that stresses in the form of displacing shear do not alter equilibrium pressures of transitions (within the experimental limits), although they do contribute enormously to the rates of such reactions.

Burns and Bredig[2] have already pointed out that the possibility of phase transformations taking place on grinding must be taken into account in explaining discrepancies in the behaviour of calcium carbonate. Our results show that: (1) 'grinding' or mixing, in both 'automatic mortars' and 'Wig-L-Bug'-type shakers not only can introduce appreciable amounts of surface and strain energy but also can quite generally cause the formation of high-pressure phases; (2) the effective maximum in the 'spectrum' of hydrostatic pressures obtained in such instruments is not less than about 15,000 bars; (3) in addition to the quasi-hydrostatic pressures exerted, the shearing stresses causing the breakage of bonds and/or the storage of strain energy result in a very marked acceleration on the kinetics of such transformations.

This work was done as part of the high-pressure studies under contract with the Office of Naval Research, Metallurgy Branch, *NONR*-656(20). We are also indebted to S. Merrin and D. Corrigan, who carried out some of the experiments reported.

Strontium-90 in the 'Mixed Layer' of the Atlantic Ocean

OCEANOGRAPHY and marine geochemistry have only relatively recently been able to take advantage of isotopic tracer techniques; unfortunately, the conceptual framework devised for isotope studies in biochemistry and physiology is not readily applicable to systems of very large spatial extension.

In considering the significance of the ocean reservoirs in the geochemistry of carbon dioxide, and in using the distribution of carbon-14 to derive rates of ocean mixing in both vertical and horizontal planes, it has been conventional[1] to divide the oceans into shallow surface reservoirs assumed to be well mixed, and deep reservoirs assumed to be only slowly renewed from the surface. Since, in some applications, the quantitative expression of this picture is extremely sensitive to the assumed depth of the surface reservoir, and to its rate of renewal from below, it seems important to point out that these parameters are measurable by using relatively short-lived radioisotopes, which are added to the system at the surface. In the case of the Atlantic Ocean, North and South, this condition is well met by radioactive strontium-90 from bomb test fall-out. To the Atlantic, strontium-90 has been added, measurably; only as fall-out to the ocean surface. In this form the isotope is wholly soluble in water[2]; and in sea water, the dilution of the radioisotope by both stable strontium and stable calcium in solution is so great that neither biological nor chemical processes produce significant changes in strontium-90 concentration. Thus, its vertical transport depends wholly on vertical movement of the water in which it is dissolved.

As a part of an extended study of the marine geochemistry of long-lived radioisotopes from fall-out, we are obtaining a number of series of measurements of the change in strontium-90 concentration with depth in the ocean. Some of these measurements, together with descriptions of the methods employed, have been published[3]. We now present (Table 1) seven series of strontium-90 analyses, all but one previously unreported. These series agree in showing very significant concentrations of radiostrontium at depth in the open ocean, both north and south of the equator. The number of analyses is still too few to justify very precise integration of the curves of strontium-90 versus depth, but an average concen-

1,200			1·6 ± 0·3				

Note.—Deviations reported are those expected from counting statistics only.

tration, from 300 to 700 m., of about half the surface value, is indicated. The upper 100 m. appears likely to be well mixed, as generally assumed, with a sharp gradient from 100 to 300–400 m. Appreciable concentrations at 1,000–1,200 m. are frequent, although we have never found measurable radiostrontium in samples from 3,000–5,000 m.

We wish to emphasize here only two features of these distributions: the indicated mass transport, and the time-scale. The water columns so far sampled appear to have from three to four times as much total strontium-90 below 100 m. as remains above that depth; and it is reasonable to assume that this radioisotope has all been added since mid-1954[4]. The possibility of vertical transport by sinking along sigma-*T* surfaces appears to be strictly ruled out by the short times available, and the enormous horizontal distances which would have to be traversed. A more or less direct vertical movement by wind-driven mixing is indicated. The facts of the close agreement of samples from 400–500 m. from the two 1957 Sargasso Sea stations, and the significantly higher figures for the July 1958 stations, support the postulate of vertical transport during the winter period of surface-water cooling and high wind velocities.

It is unfortunate that present uncertainty about the mechanism and rate of stratospheric fall-out should preclude conversion of our figures for total vertical transport of strontium-90 into annual rates of down-mixing (and hence of up-mixing) of ocean surface-water in mid-latitudes. For this, more observations over a longer time span will be needed, and this will be profitably supplemented by the collections of precipitation which have begun on weather ships. It does now seem reasonable to point out that the same mechanism which has produced in three years at depths of 300–700 m. an approximately 1 : 1 mixture of surface-layer strontium-90, and pre-1954 sub-surface strontium-90, would have produced the same sort of dilution of surface sea-water carbon-14. Broecker's weighted average[5] of carbon-14 in North Atlantic water at 200–400 m. very closely approximates this same 1 : 1 ratio. Clearly, to assign the reduction in carbon-14 activity to radioactive decay, and conclude a 'crude age' of 290 years, become untenable, in the light of our demonstration that surface-added radioactivity reaches this same concentration ratio in three years. An attempt must be made to interpret these reductions in specific activity, and that in the surface layer as well, as standing concentrations maintained by mixing processes. Unlike the situation in biochemistry, here the gradient area across the boundary between two reservoirs contains a major fraction of the tracer in the system. A very much larger flux of carbon-14 across the sea surface must then be postulated to maintain the very much greater reservoir indicated. Our strontium-90 measurements, as well as the first of the weather ship fall-out measurements[6], indicate that much more fall-out may have been delivered per unit area to the sea surface than has been reported for the land. It is of course possible simply that the sea surface is a more efficient collector of fall-out than any which have been devised for shore-based study, and that retention in the water column is more reliable than on soil. Without a theory of the processes responsible for this difference, if real, we cannot tell whether this may also help to clarify the problem of the transfer of carbon-14.

A more detailed report of this work is being prepared for early publication elsewhere. Various aspects of the programme have been supported by the United States Atomic Energy Commission (contracts *AT* (30–1)—1918, *AT* (30–1)—2174), the United States Office of Naval Research (contract *NONR*-2196) and the United States National Science Foundation. Most of the stations mentioned have been collected as part of the U.S. International Geophysical Year programme.

CHEMISTRY

Gas Content of Graphites

ARTIFICIAL graphite for use in graphite-moderated nuclear reactors, as anodes for mercury vapour rectifiers, and crucibles for vacuum fusion work should contain little gas. Otherwise, when the graphite is heated to operating temperatures, the gas is desorbed, resulting in adverse effects. For example, in the graphite-moderated nuclear reactor, hydrogen and carbon monoxide released from the graphite can interact with the fuel-cladding material (usually zirconium or stainless steel), resulting in hardening and embrittlement of the metal. Released carbon monoxide can disproportionate on cooler metal heat-exchanger surfaces depositing carbon, resulting in an adverse effect on the heat-transfer and flow properties of the system.

The present communication summarizes briefly results on the gas released from typical nuclear graphites (and an electrode graphite, for comparison) when degassed at an upper temperature between 1,500 and 2,000° C. *in vacuo*. For the degassing studies, a pumping system consisting of a liquid-nitrogen cold trap and a two-stage Van-Hespen mercury diffusion pump was used. Power to heat the graphite samples (1 in. long by ½ in. diam.) was supplied by a 5-kW. high-frequency induction generator.

Table 1 presents results for the gas released from a sample of nuclear (*A*) and a sample of electrode graphite. Both graphites were graphitized in an Acheson-type furnace, as described by Abbott[1]. For the nuclear graphite, the graphitizing was done in a chlorine (gas purified) atmosphere[2]; and the cooling was done in helium. For the electrode graphite, the atmosphere during heating and cooling consisted primarily of carbon monoxide and nitrogen which diffused in through the coke packing material. There were also significant pressures of carbon dioxide and oxygen at lower graphitizer temperatures, where the packing material did not completely convert oxygen to carbon monoxide.

Table 1. GAS RELEASED FROM GRAPHITES WHEN HEATED TO ELEVATED TEMPERATURES*

Property	Nuclear (*A*)†	Electrode‡

‡ Surface area, 0·4 m.²/gm.; porosity, 31·3 per cent; ash, 0 11 per cent.

§ Not determined.

For the results given in Table 1, runs were made on three different pieces of each graphite, with the results between each piece agreeing within 10 per cent. As expected[3], a considerably smaller quantity of gas is released from the nuclear than from the electrode graphite. This cannot be accounted for by a difference in Brunauer–Emmett–Teller surface area of the two materials. It is also noted that the percentage of carbon oxides in the evolved gas from the electrode graphite is considerably higher than from the nuclear graphite. Undoubtedly, this is a result of chemisorption by the electrode graphite of carbon monoxide, carbon dioxide and oxygen in the graphitizer and enhanced chemisorption of oxygen (because of the higher impurity content of the electrode graphite) at ambient temperatures following unpacking of the graphitizer. From other studies[4], it is concluded that the hydrogen released from a nuclear graphite is chemisorbed primarily on carbon atoms at crystallite edges.

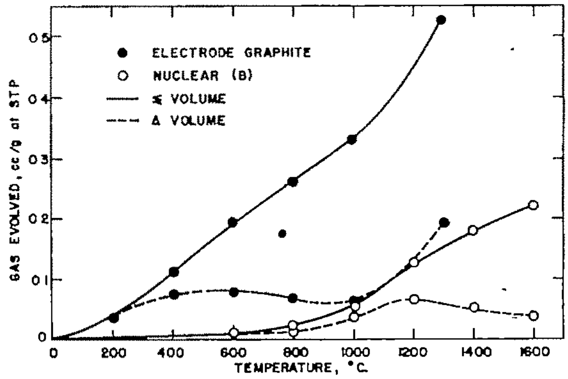

Fig. 1. Comparison of the integral and differential degassing curves for an electrode and a nuclear graphite

Gas-release from a thermally purified nuclear graphite (*B*), as a function of outgassing temperature, is compared with that from the electrode graphite (previously discussed) in Fig. 1 and Table 2. Because of the large amounts of carbon dioxide desorbed from the electrode graphite at low temperatures, a maximum in the differential degassing curve occurs at approximately 500° C. Another maximum (and higher) in the differential degassing curve of electrode graphite will occur above 1,300° C. On the other hand, for the thermally purified nuclear graphite (*B*), gas release below 800° C. is small; and only one maximum in the differential degassing curve is indicated at about 1,200° C. Interesting points to note from the results in Table 2 are:

(1) For the nuclear graphite (*B*), significant amounts of hydrocarbons are found in the gas up to 1,200° C. These gases consist mainly of C_2H_4, C_2H_2, C_2H_6, CH_4, and *iso*-C_4H_8, with C_2H_4 predominant at the lower temperatures and C_2H_2 predominant at the higher temperatures. It is uncertain what fraction of the hydrocarbons recovered is a result of reaction of carbon with desorbed hydrogen (ionized in the high-frequency induction coil)[4]. Carter and Greening[3] also reported hydrocarbons during the degassing of nuclear graphite.

(2) Considerably more water is recovered upon the low-temperature outgassing of electrode graphite than nuclear graphite (*B*). Since water adsorption on carbon occurs primarily at sites containing oxygen[5], this result is consistent with the fact that the electrode graphite originally contains more oxygen

Table 2. ANALYSES OF GAS EVOLVED FROM GRAPHITES OVER DIFFERENT TEMPERATURE INCREMENTS

1,000–1,300	24·5	75·0	nil	nil	nil

* Surface area, 0 4 m.²/gm.; porosity, 25·2 per cent; ash content, <0·07 per cent.

Table 3. Effect of Graphitization Temperature and Atmosphere on Subsequent Gas Release upon Degassing at 2,000° C.

Property	Graphite* I	II	III
Ash content (per cent)	0 87	0·044	0·0006
Total gas evolved (c.c./gm. at S.T.P.)	0·98	0 36	0·20
Analysis of gas evolved (vol. per cent):			
Hydrogen	12 5	27·5	32 0
Carbon monoxide	52 0	53 5	48·5
Carbon dioxide	19·5	15 0	11·5
Water	13·5	3·0	7 0
Hydrocarbons	2·5	1 0	1·0
Sample weight loss (per cent)	0·19	0·13	0 05

* The maximum graphitization temperatures for I, II and III are 2,600, 3,000 and 2,700° C., respectively.

(ultimately desorbed as carbon dioxide and carbon monoxide).

(3) An increase in the carbon monoxide : hydrogen ratio of the desorbed gas at outgassing temperatures above 1,000° C. for the nuclear graphite (*B*) and above 600° C. for the electrode graphite indicates that an important fraction of the carbon–oxygen complex leading to carbon monoxide has a higher thermal stability than has the chemisorbed hydrogen.

Table 3 presents results for the gas released from three samples of graphite following heat treatment under different conditions. All samples were outgassed at a maximum temperature of 2,000° C. Graphites I and II were heated and cooled under an atmosphere similar to that used for the electrode graphite. Graphite III was treated in a halogen atmosphere and cooled (flushed) in an inert gas atmosphere to about 1,500° C. It is seen again that the use of a halogen atmosphere during graphitization (and perhaps cooling, in part, in an inert atmosphere) is particularly effective in reducing the subsequent amount of gas released from the graphite. As previously discussed[4], this is related probably to enhanced removal of metallic impurities. These impurities can be oxidized and/or catalyse the chemisorption of gases on carbon. In the former case, the reduction of these metal oxides by carbon at high degassing temperatures leads to gaseous carbon oxides.

The sample weight losses, given in Table 3, are a result of both gas desorption and metal volatilization. For example, for graphite I, each process accounts for about 50 per cent of the loss of weight. Considerable material was collected on the cool walls of the desorption chamber during the degassing of sample I. An emission spectroscopic analysis indicated that the main constituents of the deposit were silicon, iron and magnesium.

The kinetics of the adsorption and desorption of hydrogen on nuclear graphite will be reported on in more detail elsewhere.

We thank the Atomic Energy Commission, Contract No. *AT* (30–1)–1710, for support of the above work.

Optical Properties of the αω-Dimethanesulphonoxyalkanes

The well-known alternation of the melting points with chain-length of a homologous series of compounds (for example, the normal paraffins, mono- and di-basic fatty acids, *n*-acetyl L-amino-acids) has been observed in the series of αω-dimethanesulphonoxyalkanes $CH_3SO_2O(CH_2)_nOSO_2CH_3$ [1]. The melting points of this series are shown plotted in Fig. 1, from which it is observed that the butane derivative ($n = 4$) exhibits a melting point which is very much larger than the rest of the series. A discontinuity of this kind is unusual, and it is of interest to examine it further.

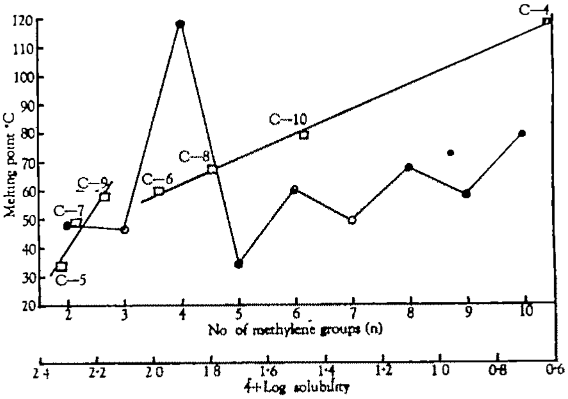

Fig. 1. Physical properties of the αω-dimethanesulphonoxyalkanes. ○, Variation in melting point with number of methylene groups; ⊡, relationship between melting point and logarithm of solubility in ether (C–4, butane derivative, etc.)

The alternation in properties of the odd and even members of the αω-dimethanesulphonoxyalkanes is reflected in their solubilities in an organic solvent, ether. Thus, as shown in Fig. 1, the odd and even series respectively show a linear relationship between their melting points, T_m, and the logarithm of their solubilities, S, that is, $\log S_{\infty} - T_m$. In terms of the Clausius equation, for ideal solution:

$$\ln S = -\frac{L_f}{R}\left\{\frac{1}{T} - \frac{1}{T_m}\right\} = -\frac{L_f}{T_m}\left\{\frac{T_m - T}{RT}\right\}$$

for constant-pressure conditions, where L_f is the latent heat of fusion of the solute and T is the temperature at which the solubility (as the mole fraction) is measured. The rectilinearity between $\log S$ and T_m suggests that, over the limited range considered, L_f increases approximately proportionately to T_m. Then $\log S = -\frac{\alpha(T_m - T)}{RT}$. The slopes of the lines for the two series differ by a factor of about 4, suggesting that the change in L_f with chain-length in the even series is greater than that for the odd series. Similar effects have been observed with other series, for example, the fatty acids[2]. It will be noted that the butane derivative ($n = 4$) exhibits the solubility properties characteristic of the even series in this respect.

The crystal form and optical constants of the compounds have been determined to examine whether the difference in the butane compound is easily interpreted in terms of the crystal structure. The values obtained are given in Table 1.

Table 1. THE OPTICAL PROPERTIES OF THE αω-DIMETHANESULPHONOXYALKANES

No. of methylene groups (n)	Crystal system	Habit	Refractive indices			Birefringence $n_\gamma - n_\alpha$	Optical data		
							Sign	Optic axial angle	
			n_α	n_β	n_γ			Range of values	Most common value
3	Orthorhombic	needles	1·489	1 504	1·513	0 024	–	66–71°	69°
4	Monoclinic	plates	1 510	1 520	1·566	0·056	+	48–55°	54°
6	Monoclinic	needles	1·477	1 504	1·523	0·046	–	68–86°	74°
7	Monoclinic	plates	1 490	1·499	1 554	0 064	+	38–45°	42°
8	Triclinic	plates	1·497	1 512	1·575	0·078	+	49–60°	55°
9	Monoclinic	plates	1·495	1 502	1 564	0·069	+	38–41°	40°
10	Triclinic	plates	1 500	1·517	1·580	0·080	+	43–56°	51°

The compounds are white crystalline solids, although some difficulty is sometimes met in crystallizing the n-pentane member of the series: this compound was not used in this study. The three principal refractive indices were determined with a three-axis universal stage by the immersion method using monochromatic sodium light and the values given have a reproducibility of + 0·002. The optic axial angle (2 V) was determined orthoscopically.

The crystal habit of the compounds and the orientation of the elements of optical symmetry have been used to assign them to a crystal system. No goniometric measurements have been made, and more detailed work by X-rays is needed to determine the fundamental crystallographic constants.

Optically, the compounds fall into two main groups: (a) those with n = 7–10; (b) those with n = 3–6. The optical constants of the compounds containing 7–10 methylene units show good agreement with the results obtained from melting point and solubility determinations. Two sub-series can be recognized: those in which n is an odd number and those in which n is even. Crystallography, optic axial angles, refractive indices and birefringence all accord within each sub-series, but can be used to distinguish between them.

The compounds for which n = 6 or less show no such simple relationship. The butane derivative (n = 4), which is abnormal in the melting point sequence, shows good agreement optically with the series n = 8–10, indicating that its abnormality is not due to fundamentally different crystal structure. The compounds in which n = 3 and n = 6 show rather unexpected similarities. Both are acicular in habit, although the hexamethylene compound (n = 6) is monoclinic whereas the trimethylene compound (n = 3) is orthorhombic. They are the only members of the series investigated which are optically negative and which have large optic axial angles (about 70°); the other compounds have optic axial angles of about 40–50°.

The investigation indicates that there is a strict correlation between chemical and optical properties in the compounds containing seven or more methylene groups. The crystallography and optical properties appear to be controlled by the number of methylene groups in the structure; compounds in which n is even are triclinic, whereas when n is odd the crystals exhibit monoclinic symmetry. The crystallography of compounds in which n = 6 or less may, on the other hand, be controlled by the methanesulphonoxy end groups which are large in relation to the remainder of the structure. The abnormally high melting point of the butane derivative (n = 4) reflects a high lattice energy which, although it is not revealed crystallographically, may be due to the relative positions of the large end groups in the space lattice.

The optical properties of a great number of such compounds have been listed by Winchell[3].

We wish to thank Dr. R. F. Hudson for helpful discussions.

Requirements for Stereospecificity in Hydrolysis by Chymotrypsin: Diethyl β-Acetamidoglutarate

As part of our study of the relation of structure of substrate to stereospecificity in enzyme reactions[1], we wish to report asymmetric hydrolysis of diethyl β-acetamidoglutarate by α-chymotrypsin. This compound was prepared by acetylation of diethyl β-aminoglutarate[2], b.p. 142–144°/2 mm.; anal. calc. for $C_{11}H_{19}NO_5$: C, 53·88; H, 7·81; N, 5·71. Found: C, 54·33; H, 7·84; N, 5·50. (Chymotrypsin was from Worthington, salt free.) A solution of 0·544 gm. of the ester and 0·524 gm. of the enzyme in 52·4 ml. of 0·02 M phosphate buffer was allowed to react at 27° in a pH-stat at pH 7·8, one ester group being 80–85 per cent hydrolysed in 5 hr. The reaction showed reproducible first-order kinetics, $k_1 = 0{\cdot}0057$ min.$^{-1}$, indicating extremely weak catalytic activity. However, the reaction was stereospecific. Neutralization of the alkali which had been added, evaporation to dryness and extraction with acetone led to optically active monoethyl-β-acetamidoglutarate, 0·318 gm., 78 per cent yield, m.p. 93–94 per cent. $[\alpha]_D^{21^\circ}$ + 5·9° (5 per cent acetone)[3]. Anal. calc. for $C_9H_{15}NO_5$: C, 49·73; H, 6·96; N, 6·45. Found: C, 49·80; H, 6·92; N, 6·51. The half-ester was prepared in the racemic form by hydrolysis of the di-ester to the di-acid, β-acetamidoglutaric acid, m.p. 185–186° dec., anal. calc. for $C_7H_{11}NO_5$: N, 7·41; found: N, 7·38; conversion of the di-acid to β-acetamidoglutaric anhydride, m.p. 140–141°; anal. calc. for $C_7H_9NO_4$: C, 49·11; H, 5·30; N, 8·18; found: C, 49·05; H, 5·26; N, 8·16; and conversion of the anhydride to racemic monoethyl β-acetamidoglutarate, m.p. 77–78°. Anal. found: C, 49·71; H, 6·92; N, 6·42. The racemic and (+) monoesters had identical infra-red spectra in chloroform.

Asymmetry is shown despite the lack of the two structural features which are characteristic of specific substrates for chymotrypsin[4], the beta-aryl and alpha-acylamido groups, which do lead to high reactivity if the stereochemistry is correct. These two groups, combined with that undergoing hydrolysis, have been thought to provide the three-point contact which has been considered necessary for asymmetry in this type of reaction[5], and for stereospecificity[6], and in particular for stereospecificity in hydrolysis by chymotrypsin[7]. However, the beta-aryl group is neither necessary nor sufficient[8] to lead to stereospecificity, while the acetamido group in either the alpha or the beta position does lead to stereospecificity in the hydrolysis of the malonate[1] and glutarate esters respectively, in which the presumed three-point contact cannot be occurring. Classical diastereomeric interactions may in principle account for asymmetric reactions of molecules of type *Cabdd* with enzymes and with other optically active reagents[9]. Scale models show that as the functional group of an asymmetric molecule attacks one group *d* of *Cabdd*, other groups of the reagent interact differently with the groups *a* and *b* at the developing centre of asymmetry *C*, depending upon which of the groups *d* is attacked. Such diastereomeric interactions of the acetamido group with rather rigidly organized asymmetric chymotrypsin may suffice to lead to reaction via preferred orientations and to stereospecificity.

We are pleased to acknowledge generous support by the Division of Research Grants, National Institutes of Health (*RG* 4584).

Structure of the Viscous Phase of Liquid Sulphur

TRANSITIONS in the liquid phase have been reported for few substances. However, sulphur has been extensively studied and the variation of most of its properties through the transition region determined[1].

At present the mobile phase Sλ, obtained on melting, is thought to consist principally of S_8 rings which open at the transition temperature of 159° and polymerize to chains of 10^4–10^6 atoms to form the S_μ phase. Evidence for the chain structure is based mainly on an interpretation of the viscosity results of Bacon and Fanelli[2], which attain a maximum of 930 poises at 166°. Powell and Eyring[3] suggested that, as the addition of as little as 0·02 per cent of iodine is capable of suppressing the viscosity maximum from 930 to 57 poises, iodine tends to add terminally to the free valencies formed when the S_8 rings open at the transition temperature, so preventing excessive chain growth.

It is possible, however, to check this hypothesis by allowing sulphur alone in the viscometer to attain its maximum viscosity at 166°, when the long chains, if present, should be fully formed, and then making the iodine addition. If the long-chain hypothesis is correct, the addition of iodine *in situ*, at this temperature, should only have a minor effect on the viscosity maximum as it will add terminally at the free valence ends of the chain. If this is done, however, it is found that the viscosity maximum is still suppressed.

This suggests that unless the iodine is able to split a sulphur chain as readily as add terminally, which is unlikely, long chains of the order estimated by Gee[4] of 10^6 and Powell and Eyring of 10^4 are not present in the viscous phase.

On the basis of the thermal conductivity, viscosity, self-diffusion and surface tension data a different model of the structure of S_μ sulphur has been proposed[5] which does not necessitate the postulated existence of long chains. In this model the sulphur units in the viscous phase have only an average molecular complexity of 20–30 atoms. However, when the S_8 rings of the Sλ phase open at the transition temperature and polymerize slightly, the new units formed at this temperature are well below their normal freezing point. In such a supercooled state the viscosity naturally attains very large values.

BIOCHEMISTRY

Bradykinin Activity of some Synthetic Peptides with only Slight Structural Resemblance to Natural Bradykinin

RECENT findings[1] have indicated an unexpected kind of structural specificity among biologically active peptides. Although minor changes in chemical structure may reduce or even abolish a particular biological activity, large and sweeping changes sometimes do not destroy potency. Thus, in such peptides as strepogenin, oxytocin, lycomarasmin and gramicidin *S*, neither the sequence of amino-acid residues in the peptide nor the actual amino-acid composition of the naturally occurring peptide is essential for biological activity. We have therefore sought to examine this situation further, and to determine whether it applies to other kinds of biologically active peptides. We have found that it does apply to bradykinin.

Pure bradykinin has only very recently been isolated[2] and shown to be an octapeptide composed of arginine, proline, phenylalanine, glycine and serine. At the time this result was announced, we had isolated from enzymic digests of insulin the disulphide of leucylvalylcysteinylglycylglutamylarginine (a peptide with strepogenin activity), and had synthesized it[3]. As by-products of the synthesis, several related peptides were also available. Because these compounds were of nearly the same size as bradykinin, and, like it, contained arginine, assays of their

Table 1. AMOUNTS OF COMPOUNDS NECESSARY TO CAUSE MAXIMAL CONTRACTION

Compound	Ileum (mgm./ml.)	Uterus (mgm./ml.)
Bradykinin*	5×10^{-6}	5×10^{-7}
A	inactive at 10	—
GlA	inactive at 12	—
$(LVCGGlA)_2$	inactive at 2	inactive at 0·1
$(LVCGGlA \text{ diamide})_2$	1·4	0·14
$(LVCG\textit{iso}GlA)_2$	0·2	0·1
Histamine	5×10^{-4}	—
Serotonin	—	1×10^{-5}

A = arginine, Gl = glutamyl, G = glycyl, C = cysteinyl, L = leucyl, V = valyl and *iso*Gl = a glutamic acid residue joined by the γ-carboxyl group to the amino-group of the next amino-acid.

* Values given are for pure bradykinin and were taken from a personal communication from Dr. D. F. Elliott.

ability to function as bradykinin were carried out. It was felt that if the situation outlined at the start of this communication had general validity, some of the synthetic peptides should show bradykinin activity. Thus, the only amino-acids in common among the synthetic peptides and natural bradykinin would be arginine and glycine.

Assays were performed as described by Roche e Silva[4]. Both the isolated guinea pig ileum and the isolated rat uterus were used. The former was standardized with histamine, and the latter with serotonin. The peptides available were glutamylarginine and the disulphide dimers of leucylvalylcysteinylglycylglutamylarginine, its diamide, and leucylvalylcysteinylglycyl*iso*glutamylarginine. These were dissolved in the salt solution appropriate for each type of assay, and the *p*H of the solutions was adjusted to that of the test system. Each active peptide gave the typical slow contraction of the muscles shown by natural bradykinin, and the effects were not overcome by an antihistamine (benadryl).

The results are summarized in Table 1. There it can be seen that some only of the peptides exhibited activity. Consequently, a mere peptide of arginine, or of arginine and glycine, was not enough. Free arginine likewise was inactive. Note that although leucylvalylcysteinylglycylglutamylarginine was inactive up to 2 mgm., its diamide was potent. This might suggest that overall charge on the molecule was important for activity, especially since natural bradykinin contains no dibasic amino-acid residue. However, the corresponding *iso*glutamyl peptide, which has approximately the same charge as its isomeric inactive relative, was active. One might say that so long as the gamma carboxyl group of glutamic acid in the peptide was substituted (either by ammonia or by arginine), activity resulted, whereas if it was free the peptide was inactive.

The synthetic peptides studied were not nearly so potent as bradykinin, even though they did show activity. This may have been because of their striking difference in chemical structure from the natural compound, but may also have been related to the fact that the synthetics were larger than bradykinin. The synthetic peptides were disulphides, and the active ones were thus composed of 12 amino-acid residues, whereas bradykinin contains 8. One striking feature of active peptides related to strepogenin and to the melanophore-stimulating hormone has been that in each case an optimal size seems to be important for highest potency[1,5]. Whatever the merits of this question about size, the present results show clearly that for bradykinin, just as for strepogenin, oxytocin, etc., the exact chemical constitution of the naturally occurring peptide is not essential for biological activity, even though it may influence the potency quantitatively.

This investigation was supported in part by a grant from the United States Public Health Service.

Synthesis of Contractile Proteins in the X-Irradiated Embryo

IN skeletal muscle the formation of actin precedes that of myosin in the early developmental stages of the chick[1,2] as well as *Triturus pyrrhogaster*[3], and in regenerating limb tissues of the latter[3]. The following questions therefore arose[4]: Does the formation of actin induce that of myosin and does it directly cause myosin formation? To obtain an answer to this question, the synthesis of contractile proteins in X-irradiated embryos of *Triturus pyrrhogaster* was examined by means of a serological technique[3].

G-Actin and myosin were prepared from large specimens of *Triturus pyrrhogaster* by the method of Straub and Szent-Györgyi[5]. Both proteins were injected intravenously (four times with 3-day intervals, 100 mgm. in total) into rabbits. The immunized rabbit sera were raised to their serological specificity by resorption test with saline extracts of liver, spleen and skin tissue of *Triturus pyrrhogaster*. Titration with homologous antigen was then carried out. The titre of both sera was adjusted to 1 : 512 before carrying out the precipitin reaction with saline extracts of X-irradiated embryos. Constant volumes of sera and progressively decreasing amounts of antigen were used in order to avoid an excess of antigen. The irradiation of embryos was carried out 108 hr. after fertilization under the conditions of Table 1.

Table 1. IRRADIATION CONDITIONS

Dose of X-rays (r.)	kVp.	m.amp.	Filter	Target-object distance (cm.)	Intensity (per min.)
500	180	25·0	Cu (1·0 mm.) + Al (0·5 mm.)	28	167·6
200	,,	10·0	,,	,,	66·6
50	,,	2·5	,,	,,	16·7

In normal embryos, actin and myosin first became detectable 132 and 176 hr., respectively, after fertilization[3]. In the case of irradiation with 50 r., both actin and myosin were detected 156 hr. after fertilization. The time of actin and myosin formation after fertilization was changed to 180 and 144 hr., respectively, with 200 r., and to 204 and 132 hr., respectively, with 500 r., as shown in Fig. 1.

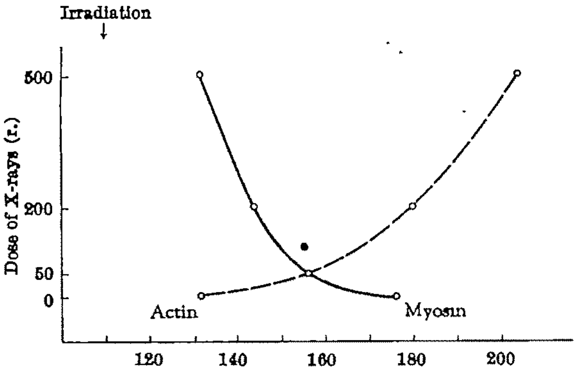

Fig. 1. Synthesis of contractile proteins in early development of the embryo of *Triturus pyrrhogaster* irradiated by X-rays 108 hr. after fertilization

X-irradiation 108 hr. after fertilization, therefore, markedly suppresses the synthesis of actin and promotes that of myosin in early developmental stages. The order of actin and myosin formation in the irradiated embryos at doses of 200 r. and 500 r. was opposite to that found in the non-irradiated control.

It was thus proved that during skeletal muscle differentiation in the early embryo of *Triturus pyrrhogaster*, the formation of actin does not induce that of myosin and the processes of synthesis of those proteins are independent of each other.

Production of Shikimic Acid by *Penicillium griseofulvum* Dierckx

SEVERAL phenolic substances have been isolated from the cultures of *Penicillium griseofulvum* Dierckx: 2-hydroxy-6-methylbenzoic acid[1], 2,5-dihydroxybenzoic acid[2], *o*-, *m*- and *p*-hydroxybenzoic acid[3], 2,4-dihydroxybenzoic acid, 3,4-dihydroxybenzoic acid and 3,5-dihydroxybenzoic acid[4]. Those compounds, together with amino-benzoic acids[5], fulvic acid[6], griseofulvine[7] and patuline[8], were identified in metabolic solutions of cultures ten days of age or older. In order to detect substances which could be involved in the production of benzoic derivatives it seemed advisable to investigate the metabolic solution in the earliest stages of the culture. This has led to the identification of shikimic acid, which is interesting because of its possible conversion to phenolic substances such as has been shown for *Escherichia coli*[9]. Besides shikimic acid, sedoheptulose, *d*-erythrose and pyruvic acid have also been found. This communication describes the isolation and identification of shikimic acid and related substances.

Batches of 500 Erlenmeyer flasks of 500 ml. capacity each containing 100 ml. Czapek–Dox medium were aseptically inoculated with a suspension of *P. griseofulvum* (our strain *P* 34) and incubated at 25°. After 30 hr. the cultures were filtered through Chardin filter paper. The metabolic solution, having a *p*H of 5·8, was passed successively through a column of 'Dowex 50' (chloride) and then through a column of 'Dowex 2' (acetate). This last column was then washed with distilled water until sugar could no longer be detected, and after this washing it was eluted with a mixture of 50 per cent *N*/10 sodium acetate and 50 per cent *N*/10 acetic acid. The eluate was acidified to *p*H 3 by addition of *N*/10 hydrochloric acid and concentrated *in vacuo*.

The paper chromatography of this solution was carried out with Whatman paper No. 4 using four different solvents giving the following R_F:

	Shikimic acid	5-Dehydro-shikimic acid	5-Phospho-shikimic acid
n-Butanol–formic acid–water (50:2·5:10, v/v) (ref. 10)	0·43	0 46	0 09
n-Butanol–acetic acid–water (50:3:12·5) (ref. 10)	0·42	0 22	0·05
Phenol–water (3:1 w/v) (ref. 11)	0·44	0·48	0·11
tert.Butanol– benzyl. alc.–*iso*propanol–water (1 3 1:1, v/v) (ref. 11)	0·42	0 50	0·01

The reagents used were: (1) bromocresol green, (2) ammoniacal silver nitrate and (3) a succession of metaperiodate, nitroprussiate and piperazine. The chromatogram was then warmed to 105° C.[12].

These three reagents gave yellow spots for shikimic acid, 5-dehydroshikimic acid and for 5-phosphoshikimic acid. The identification of shikimic acid was also confirmed by co-chromatography with an authentic sample.

In order to obtain some information concerning the biosynthesis of shikimic acid the following experiments were carried out.

The mould was grown for 10 days at 25° in 500-ml. Erlenmeyer flasks containing 100 ml. Czapek–Dox medium. After having eliminated the culture solution, the mycelium felts were aseptically washed three times, each time with 100 ml. sterile distilled water. Then the preformed mycelium was left to act for 28 hr. at 25° on 100 ml. of one of the four following solutions: (1) *d*-erythrose 10^{-3} *M*, pyruvic acid 10^{-3} *M* and adenosine triphosphate 10^{-4} *M*; (2) *d*-erythrose, 10^{-3} *M*; (3) pyruvic acid, 10^{-3} *M*; (4) *d*-erythrose, 10^{-3} *M* and pyruvic acid 10^{-3} *M*.

After incubation the solutions were filtered and chromatographically analysed as described above. The results were that in solution (1) 5-dehydroshikimic acid and 5-phosphoshikimic acid were present while in solution (4) only traces of those substances could be detected and neither of them could be found in solutions (2) and (3).

Another series of experiments was made where *d*-erythrose was replaced by sedoheptulose. After 28 hr. incubation solution (1) contained only traces of 5-dehydroshikimic acid and of 5-phosphoshikimic acid and solution (4) contained none of either. But after 48 hr. incubation solution (1) contained more 5-dehydroshikimic acid and 5-phosphoshikimic acid, while in solution (4) traces of those two acids were detected.

Two other series of experiments were carried out with the same solutions but with shaken cultures. The results were exactly the same as those obtained with the ordinary cultures.

This is the first time that shikimic acid has been reported in mould metabolism. This substance seems particularly interesting owing to its probable place in the biosynthesis of the benzene ring which is present in many mould metabolites.

On the other hand, neither quinic acid nor dehydroquinic acid could be detected in the metabolic solution of *P. griseofulvum*, although those acids have been proved to play an important part in the synthesis of shikimic acid by *Escherichia coli*[13].

It is also worthy of note that shikimic acid is formed more readily by *P. griseofulvum* from *d*-erythrose + pyruvic acid + adenosine triphosphate than from sedoheptulose + pyruvic acid + adenosine triphosphate. This seems to suggest that in this case the biosynthesis of shikimic acid proceeds more easily via $C_4 + C_3$, while it has been shown for *Escherichia coli* that this biosynthesis takes place via sedoheptulose[14].

Finally, the comparison between the results obtained with solution (1) and with solution (4) points to the hypothesis that these phosphoric esters are directly involved in the synthesis, namely, *d*-erythrose-4-phosphate and phospho-enol pyruvic acid.

Measurement of Transaminases in Serum

WITH the growing emphasis on the study of glutamic oxaloacetic and glutamic pyruvic transaminases of the serum, both in the diagnosis and the prognosis of a large number of pathological conditions, particularly in cardiovascular and hepatic diseases, a need for a simple and accurate method for the measurement of these transaminases is apparent.

A sensitive method has been devised which serves for the accurate and concurrent determination of the transaminases. This method can be used to assess the accuracy of earlier methods[1,3-5], and because of its simplicity it can be used easily as a routine method in clinical investigations.

The method involves the transamination by the serum of *dl*-alanine and α-ketoglutarate to glutamate and pyruvate (in the case of glutamic pyruvic transaminase) and of *dl*-aspartate and α-ketoglutarate to glutamate and oxaloacetate (in the case of glutamic oxaloacetic transaminase), in the following reaction:

$$R.\mathrm{CH.NH_2.COOH} + R'\mathrm{CO.COOH} \overset{(T)}{\rightleftharpoons} R.\mathrm{CO.COOH} + R'\mathrm{CH.NH_2\ COOH}$$

The measurement is based in the determination of the end-product of the transamination (pyruvate and oxaloacetate, respectively).

The substrates used are as follow:

(1) Glutamic pyruvic transaminase, 0·2 *M* *dl*-alanine and 0·002 *M* α-ketoglutaric acid: *dl*-alanine, 1·78 gm.; α-ketoglutaric acid, 0·03 gm.; dipotassium hydrogen phosphate, 2·00 gm.; distilled water to make up 100·00 ml.

(2) Glutamic oxaloacetic transaminase, 0·2 *M* *dl*-aspartic acid and 0·002 *M* α-ketoglutaric acid: *dl*-aspartic acid, 2·66 gm.; α-ketoglutaric acid, 0·03 gm.; dipotassium hydrogen phosphate, 2·00 gm.; distilled water to make up 100·00 ml. The reagents at the beginning are diluted to 80·00 ml. with water, adjusted to *p*H 7·4 with sodium hydroxide and made up to 100·00 ml. To each is added 1 per cent clear chloroform as a preservative. They can be kept in the refrigerator for many weeks, but should be discarded if they become cloudy or mouldy.

Other reagents used are: (*a*) aniline citrate: citric acid, 5·0 gm.; distilled water, 5·0 ml.; aniline, 5·0 ml.: the reagent is diluted before use 1 : 5 with distilled water; (*b*) dinitrophenylhydrazine 0·002 *M*: 2,4-dinitrophenylhydrazine, 0·04 gm.; conc. hydrochloric acid, 5·00 ml.; distilled water, 95·00 ml.; the reagent is diluted in the hydrochloric acid with 15–20 ml. water with vigorous shaking and made up to 100·00 ml.; (*c*) aqueous solution of 0·75 *M* sodium hydroxide; (*d*) pyruvic acid stock solution: pyruvic acid, 1·00 gm.; distilled water, made up to 1,000·00 ml.; it should be stored in the refrigerator.

To 0·8 ml. of serum saline in a test-tube add 0·2 ml. of serum with a pipette and mix the contents. 0·5 ml. of substrate for glutamic pyruvic or glutamic oxaloacetic transaminase is added and the tube is placed in a water-bath for 60 min. at 37° C. The tube is then held at room temperature and 0·5 ml. of the diluted citrate aniline is pipetted into it; this stops the enzymatic reaction. Immediately 0·5 ml. dinitrophenylhydrazine is added and the contents are vigorously mixed. Exactly 5 min. after the addition of the latter reagent (the time necessary to form pyruvate–dinitrophenylhydrazone but excluding the formation of α-ketoglutarate–dinitrophenylhydrazone), 3·0 ml. of sodium hydroxide are added, the contents are mixed by inversion of the tube and the colour produced is measured after 30 min. (the colour remains stable for 1 hr.), in a spectrophotometer at 500 mμ with a cuvette of 1 cm. diameter, against the blank set at zero optical density. The blank is a mixture of the reagents prepared in the same way as that of the sample, except that the serum is replaced with serum saline.

From the graph prepared with the use of known solutions of pyruvic acid (20, 40, 60 . . . 500 μgm./ml.) in the place of the serum and in the same quantity (0·2 ml.), after treatment of the tube as described, the pyruvic acid formed by the serum sample is determined directly in micrograms per ml. at 37° C., and for a period of 60 min. 1 unit is the amount of activity in 1·0 ml. of serum that results in the formation of 1 μgm. of pyruvate as defined by Cabaud *et al.*[1].

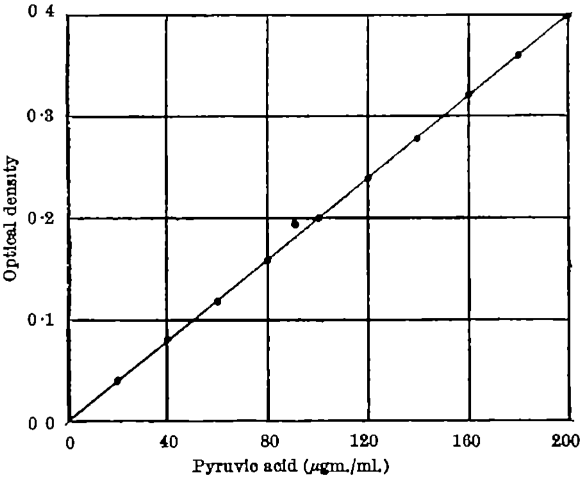

Fig. 1. Graph prepared with the use of known solutions of pyruvic acid, treated in the same way as the serum for glutamic pyruvic and glutamic oxaloacetic transaminase under the conditions described in the text. It is evident that linear relations exist between solutions of pyruvic acid from 0–200 μgm./ml. and the optical density produced and exhibited by them. The colorimetric measurement is made in a 'Unicam 600' spectrophotometer at 500 mμ with a cuvette of 1 cm. diameter

Fig. 1 indicates that the colorimetric reaction under the conditions of this technique follows closely Beer's law, up to the concentration of 200 μgm./ml. In the case in which the activity of the serum is very high, the determination is repeated with a sample of the serum diluted 1/5 or 1/10 with serum saline and the final result obtained is multiplied by 5 or 10.

An investigation of certain colorimetric methods for the estimation of transaminases in serum demonstrated the difficulties and inconveniences of some of the techniques. The methods described by Cabaud, Leeper and Wroblewski[1,2] and by Umbreit, Kingsley, Schaffert and Siplet[3] are characterized by the same principles as those of Tonhazy, White and Umbreit[4]. These methods are cumbrous. The deproteinization of the serum, the extraction by toluene and centrifugation require many manipulations. The separation of the toluene fraction is often difficult, and in many cases it forms a gelatinous mass and is obtained only after breaking it up and repeated centrifugations. On the other hand, the alkalinization of toluene requires the use of recently prepared solutions of alcoholic potassium hydroxide, which causes cloudiness of the mixture after the lapse of a few minutes.

In comparison with the previous methods, the method of Reitman and Frankel[5] is exceptionally easy and simple. Experience shows, however, that the method is unsatisfactory, because of its particular characteristics ; for the colorimetric determinations of the end product (pyruvate and oxalate) formed are made by the use of a graph of mixed solutions of the pyruvic and α-ketoglutaric acids, in an empirical way.

It is evident that the method described is considerably simpler, requiring the use of a test-tube only for the transamination reaction and for the determination of the pyruvate produced. In addition it is accurate, because the end products, pyruvate in the case of the glutamic pyruvic transaminase, and the resulting pyruvate by decarboxylation of oxaloacetate by the use of citrated aniline in the case of glutamic oxaloacetic transaminase, are both calculated directly by the use of a prepared graph on the basis of known solutions of pyruvic acid. The method is also very sensitive. The greatest error found among the replicates of a considerable number of normal and pathological sera was approximately 2·5 per cent.

In 50 presumably healthy individuals of ages ranging from 20 to 40 years the range of values for glutamic pyruvic and glutamic oxaloacetic transaminase was found to be 15–98 and 26–92 units per ml. of serum determined at a temperature of 37° C., and for a period of 60 min. Thus readings above 100 units per ml. indicate pathological conditions.

Conjugation of 3 : 4-Benzpyrenols in Mouse Skin

The liver is undoubtedly the major site of glucuronide synthesis in the mammal[1,2], but varying degrees of glucuronide synthesizing activity have also been reported for other tissues. These include the kidney[1,2], intestine[3], cartilage[4] and granulation tissue[5], although the findings of different workers have not always been in agreement. The only specific investigation of this nature which we have been able to find applied to such activity in skin is that of Zini[6], who reported that isolated rat skin possesses 'some' glucuronide synthesizing activity with *o*-aminophenol as substrate. No quantitative details are given, but the assumption is that the level of activity falls far below that of other tissues in which significant activity was observed. Evidence from another field, however, would suggest that the glucuronide synthesizing ability of skin may be by no means insignificant and indeed may play an important part in the detoxification of foreign substances at that site. Thus it is now well confirmed that the carcinogenic hydrocarbon, 3 : 4-benzpyrene, is metabolized in mouse skin both *in vivo*[7-9] and *in vitro*[10] to yield a water-soluble polar derivative designated as BPX_2 (ref. 7). Subsequent work by one of us (K. H. H.) has shown this metabolic fraction to consist of a mixture of glucuronide conjugated benzpyrenols[11]. The analogous sulphate conjugated fraction[11], on the other hand, has not so far been detected within the skin, and this has led one of us (G. C.) to suggest that the formation of this complex (BPX_1) is divorced from the carcinogenic response elicited by 3 : 4-benzpyrene at this site[9]. It was of importance, therefore, to re-examine the conjugating ability of mouse skin in the light of this evidence.

Mice, in batches of about twenty, were closely clipped or plucked and in parallel experiments a solution of either 3 : 4-benzpyrene or the phenol, 8-benzpyrenol, in acetone was applied to the denuded areas of skin. After varying intervals of time the animals were killed and the treated areas of skin removed, minced and homogenized. Extraction and separation into glucuronide and sulphate conjugated fractions were then carried out using a modified form of the original method of Weigert and Mottram[7]. Details of this have been published elsewhere[11].

The experiments with 3 : 4-benzpyrene confirmed the findings of other workers with regard to the formation of benzpyrenyl glucuronides within the skin although the concentration at any time was found to be low. Identical behaviour was observed in the parallel experiment with the phenolic derivative 8-benzpyrenol, for, although the glucuronic acid ester was readily detected in the extracts, the total amount present at any time was of the same order as that yielded by the parent hydrocarbon. This suggests that the initial hydroxylation of benzpyrene is not a limiting factor in determining the concentration of conjugated metabolites within the skin.

Throughout these experiments evidence was also sought of conjugation with sulphuric acid. Trace amounts of a metabolite possessing the physical properties of a benzpyrenyl sulphate were isolated after treatment with both 3 : 4-benzpyrene and 8-benzpyrenol, but the small amount obtained prevented an unequivocal identification. *In vitro* studies with microsome-free supernatant fraction of skin homogenate fortified with adenosine triphosphate, as described by De Meio, Wizerkaniuk and Fabiani[12], yielded inconclusive results.

The conclusion arrived at from this work, therefore, is that mouse skin does possess the ability to conjugate foreign phenolic compounds with glucuronic acid and possibly sulphuric acid. To what extent this occurs, however, is as yet unknown, for these experiments do not preclude the possibility that the conjugates are either rapidly removed from the skin via the blood stream or perhaps bound firmly to cellular constituents. The additional point also arises that hydroxylation of aromatic hydrocarbons can occur within the skin although no evidence exists as yet as to the mechanisms involved.

Heterogeneity of Tumour Ribonucleic Acid and the Effect of 'Degranol' on it

IN view of its importance to the study of the chemical properties and specific biological functions of nucleic acids, in recent years much attention has been devoted to the heterogeneity of this group of compounds[1-4].

In earlier papers[5,6] we reported the elaboration of a new method and the results obtained with it in a study of the heterogeneity of ribonucleic acid obtained from rabbit liver and labelled with phosphorus-32 *in vivo*.

The present communication describes the heterogeneity of ribonucleic acid obtained from Guérin carcinoma transplanted into rats and labelled with phosphorus-32 *in vivo*; further, the effect on this heterogeneity of 1,6-*bis*-(-β-chloroethylamino)-1,6-deoxy-D-mannitol-dihydrochloride ('Degranol'; B.C.M.)[7].

Inbred albino rats weighing 120–150 gm. were inoculated subcutaneously with Guérin carcinoma, and divided into two groups. One group was given intravenously a 50 mgm./kgm. dose of 'Degranol' 14–16 days after the transplantation of the tumour, and the other was left untreated. The animals received a 100 μc./100 gm. intraperitoneal dose of phosphorus-32 at 48 hr., and were decapitated at 72 hr. after 'Degranol'. Each of the resultant tumours was worked up separately and the ribonucleic acid was recovered from the whole tumour by the method of Pain and Butler[8], modified inasmuch as the ribonucleic acid precipitated by the addition of 96 per cent ethanol was dissolved in 0·2 M sodium chloride and dialysed for 24 hr. at + 4° C. against 0·2 M sodium chloride. A quantity of 6–10 mgm. of ribonucleic acid was adsorbed on a 6 cm. × 1·5 cm. 'Dowex-2' resin column (Cl-form, 10 per cent cross-linkage, 200–300 mesh) and eluted with sodium chloride solutions of continually increasing concentration. The reservoir contained 2·8 M sodium chloride, and the 225-ml. mixing flask, initially, 0·3 M sodium chloride. The rate of flow was 0·25 ml./min. 5-ml. fractions were collected, and aliquot parts of these were used to determine radioactivity and ribonucleic acid content, the latter by the orcinol reaction as modified by Ceriotti[9].

Fig. 1 shows that the ribonucleic acid isolated from whole tumour is heterogeneous; moreover, that the individual fractions of ribonucleic acid differ in specific activity. This difference permits the conclusion, which is consistent with that drawn from our earlier heterogeneity studies of rabbit liver ribonucleic acid[6], that in the living organism the phosphorus-32 exchange in the individual ribonucleic acid fractions proceeds at different rates.

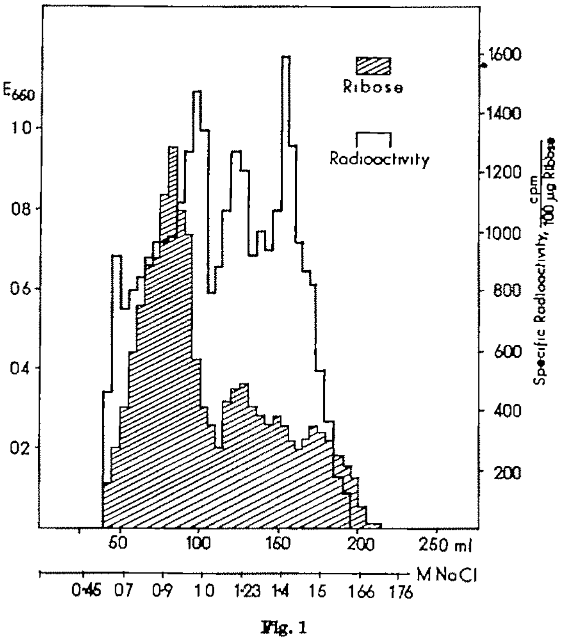

Fig. 1

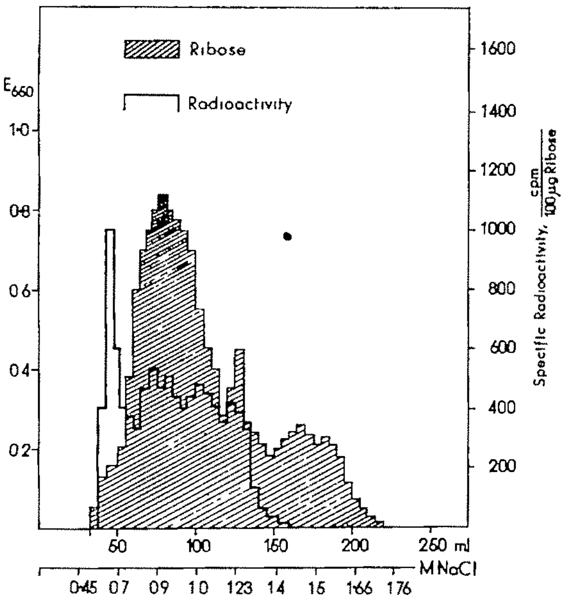

Fig. 2

Kellner *et al.*[10,11] have shown that morphologically the peak effect of 'Degranol' appears between 48 and 72 hr. after treatment, manifesting itself in extensive cellular and nuclear disintegration in the florid parts of the tumour. Hidvégi *et al.*[12,13] have observed a substantial decrease at that same period of time in the relative specific activity of the phosphorus-32 in the deoxyribonucleic acid, and a less notable, but still significant, fall in the ribonucleic acid of the nuclei and the cytoplasma. For these reasons, in our experimental animals we have studied the heterogeneity of the tumour ribonucleic acid at 72 hr. after 'Degranol', when the drug has been established to exert its maximum effect.

On the evidence of Fig. 2, 'Degranol' causes no change in heterogeneity in ribonucleic acid but does give rise to essential differences in the incorporation of phosphorus-32. Appreciable radioactivity was only measured in fractions which could be eluted at lower sodium chloride molarities.

ANIMAL PHYSIOLOGY

Effects of 1,4-Dihydrazinophthalazine on the Catechol Amines

IN a previous communication in *Nature*[1] some effects of 'Nepresoline' on the catechol amines in various organs of rats and on the adrenal medullary secretion in cats were described. Further experiments using chiefly the same technique have been carried out.

A total of 165 male albino rats with an average body-weight of 250 gm. were divided into groups of five and injected with 5–50 mgm./kgm. 'Nepresoline' subcutaneously twice a day on three consecutive days. The control groups were given an equivalent amount of vehicle. The rats were killed with a blow on the head on the first, third and fifth day after the last injection, respectively. The content of adrenaline and noradrenaline in adrenals, brain, heart and spleen was determined fluorimetrically after purification by absorption on aluminium oxide. All values were measured in μgm./gm. organ weight.

The effect of intravenous injection of 5 mgm./kgm. 'Nepresoline' on the secretion from the left adrenal after sectioning the corresponding splanchnic nerve was studied on 5 cats weighing 3–4 kgm., anæsthetized with 'Nembutal' (40 mgm./kgm. intraperitoneally). In one case the spinal cord was divided at *C* 1.

Venous blood from the left adrenal was collected at intervals before and after giving 'Nepresoline', using an adrenolumbar-femoral vein shunt technique. The adrenal vein plasma samples were assayed biologically on the cat's blood pressure and the hen's rectal cæcum.

In the rats, a dose of 5 mgm./kgm. caused in some experiments a marked depletion of noradrenaline in heart and adrenal. However, this effect was irregular. With higher doses of 'Nepresoline' a definite reduction of the content of both adrenaline and noradrenaline in the adrenals was found. With a dose of 50 mgm./kgm. a low level of noradrenaline was occasionally found in the brain. The only organ which showed complete regularity in response was the adrenal (Table 1).

Table 1. MEAN VALUES FOR CATECHOL AMINE CONTENT OF THE RAT'S ADRENAL AFTER VARIOUS DOSES OF 'NEPRESOLINE'
The corresponding values for controls, injected with an equivalent amount of solvent, are given within brackets

'Nepresoline' dose	Adrenaline		Noradrenaline	
	μgm./gm. organ	per cent of control values	μgm./gm. organ	per cent of control values
10 mgm./kgm.	578 (803)	71	118 (137)	86
50 mgm./kgm.	266 (680)	39	77 (137)	56

In cats, after adrenal denervation, 'Nepresoline' caused a much less definite secretory response than was found in cats with intact innervation. In one case no response was seen, whereas in four cats a slight stimulation of the medullary secretion occurred. In the spinal cat preparation, no definite increase in the secretion was found.

The effects of 'Nepresoline' on various organs in rats show a surprising and disturbing variation. However, it seems that, if fairly high doses are used, consistent reduction of the amount of adrenaline and noradrenaline in the adrenal was found.

As mentioned in the previous communication, low noradrenaline values were found for the heart after 'Nepresoline'. This effect we have not been able to confirm in more recent experiments. In the brain, after higher doses of 'Nepresoline', a reduction of the noradrenaline-level occurred occasionally. The variability in the response of these organs to 'Nepresoline' remains unexplained.

The results of the cat experiments suggest that the effect of 'Nepresoline' on the adrenal secretion is mainly mediated through the nervous system. In our previous report it was mentioned that baroreceptor denervation by vagotomy and carotid sinus denervation did not abolish the response. Thus it seems likely that the effect is not reflexly elicited by fall of blood pressure, but is due rather to the direct action of 'Nepresoline' on some structure in the central nervous system and possibly to some extent on the adrenals.

Further experiments to elucidate the mechanism of the 'Nepresoline' effects on the adrenal are in progress.

This investigation has been supported by grants from Karolinska Institutet and Svenska Sällskapet for Medicinsk Forskning.

Diurnal Temperature Variation in the Rhesus Monkey under Normal and Experimental Conditions

A diurnal temperature variation has been previously reported[1] in the unrestrained rhesus monkey (*Macacca mulatta*) the confirmation of which was the object of the present study. An accurate estimate of diurnal temperature variation is a necessary prerequisite for assessing basal body-temperature in this species.

Temperature recordings were made routinely with a clinical thermometer per vaginam in nine mature female rhesus monkeys which had become accustomed to handling in a previous study[2]. The monkeys during the control period were kept one to a cage, in quarters previously described[3] in which ambient temperature and humidity conditions were held constant and artificial lighting (virtually the only source of illumination) was controlled. Lights were on during 8 a.m.–4 p.m. each day, preceded and followed by dawn and dusk, night-time (near total darkness) intervening.

Temperature recordings were made at 10 a.m., 1.30 p.m., 5 p.m., and 10 p.m. over a period of one month. The former two temperature recordings were made in artificial illumination, the latter two recordings under conditions of near total darkness.

As previously observed[1], if a monkey was inclined to struggle during handling, its temperature slightly increased. If the monkey was purposely stressed by being chased, a temperature increase of 1° F. promptly occurred. With repeated recordings, the monkeys became acclimatized, and temperature values obtained were not believed to be due in part to incidental struggling.

In 6 of the 9 animals studied, the mean temperature values (and associated standard deviations) over the 12-hr. period of recording are plotted individually (Fig. 1). The range of the temperature variation under the control or normal condition in each animal is given in the upper right-hand corner of the respective graph and is plotted along a 24-hr. abscissa in a solid black line. The number of recordings upon which the control or normal variation is based is indicated in the upper right-hand corner under the value of the range.

The highest temperatures recorded were obtained usually in the early afternoon, the lowest temperatures at 10 p.m., about 5 hr. after the onset of near total darkness.

The animals were further studied for 3 months in an isolated, light-tight environment in which temperature and humidity conditions of the control period were maintained and held constant, but lighting conditions altered. Periods of 14 hr. of total darkness were followed by periods of 16 hr. of bright light. This 30-hr. dark-light period, and the relative absence of daily noise were the two most marked differences between the control and experimentally modified environmental conditions.

In the experimental environment, temperatures were recorded at the approximate midpoint during the light period, and at 5 and 10 hr. after the onset of total darkness. Temperatures were recorded in the total darkness in the light-tight experimental environment by first darkening the ante-chamber before entering the totally darkened room, so that recordings could be made with minimal disturbance to the animals.

The variation in temperature encountered in the experimental environment is plotted individually (dotted lines, Fig. 1), and in the upper right hand corner of each individual graph is the number of

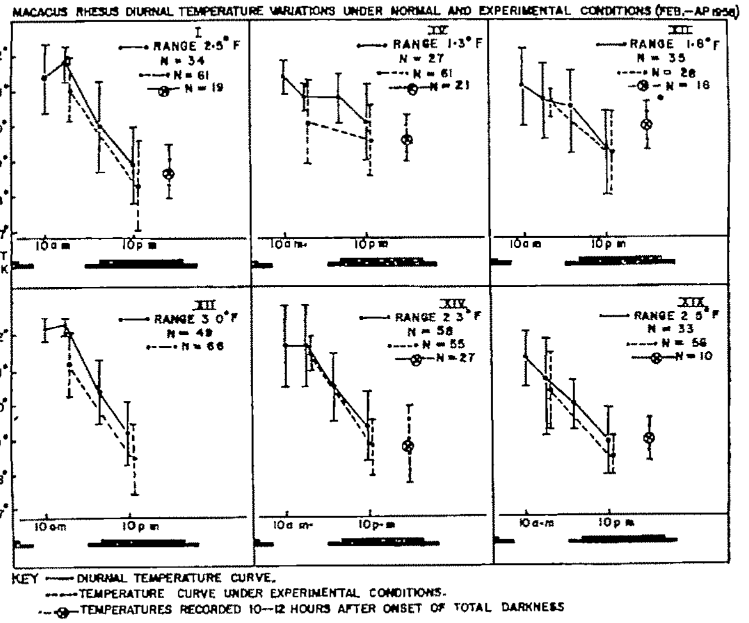

Fig. 1

recordings upon which the experimental temperature variation is based.

The temperature-range over the 30-hr. light-dark period has been plotted in terms of the 24-hr. time-base of the control environment to make similar periods of temperature recordings comparable. It may be noted that the temperatures in the experimental environment, both at the midpoint of the light period and 5 hr. after the onset of total darkness, were of the same approximate magnitude, but in all cases somewhat less than those encountered at comparable times diurnally, so that similar slopes between diurnal and experimental temperature curves resulted when the values were plotted.

In order to ascertain the period of greatest temperature depression in the experimental environment, temperature recordings were made at both 5 and 10 hr. after the commencement of total darkness. The latter mean temperature value (based on the number of recordings indicated in the upper right-hand corner of individual graphs) has been plotted in 5 of the 6 animals studied. In 4 out of 5 of these animals, mean temperatures 10 hr. after the onset of total darkness were slightly higher than the temperatures occurring 5 hr. after the onset of total darkness, but less than temperatures recorded in the light. In the fifth recorded animal (XIV, Fig. 1) the mean temperature value 10 hr. after the onset of darkness was the same as that occurring 5 hr. earlier.

The slight, but systematic reduction in temperatures in the experimental environment compared with diurnal values can be explained in two possible ways: (1) the relative absence of diurnal noise, and (2) the fact that the monkeys were out of sight of other monkeys of the main colony room, the isolation from which deprived them of sensory stimuli. The fact that depressed temperatures 5 hr. after the onset of total darkness in the experimental environment were less than those recorded diurnally may be due to the condition of total darkness achieved experimentally, but not achieved during the control night-time periods.

Table 1

Animal				Temperature (° F.)
XIII	*Macacca*	*mulatta*	female	3·0
I	,,	,,	,,	2·6
XIX	,,	,,	,,	2·5
XIV	,,	,,	,,	2·3
III	,,	,,	,,	2·1
XII	,,	,,	,,	1·8
X	,,	,,	,,	1·7
IV	,,	,,	,,	1·3
			Mean:	2·16
			S.D.	1·47

Table 1 illustrates the range of diurnal temperature variation encountered in the nine animals studied. The diurnal range in two *Macacca mulatta* previously studied[1] was of the order of 3° F., a finding which the present study confirmed. It may be concluded that the diurnal range in temperature variation in the *Macacca mulatta* is largely a light-dependent phenomenon.

Body-weight and Liver —SH Levels of Mice

DURING the course of some recent work[1] the —SH levels of the liver tissue of groups of mice were determined. In any one group (10 animals) most figures fell very close to the mean figure, but an occasional case occurred showing a considerable divergence from the mean. The impression was gained that those animals whose liver —SH diverged most from the mean figure were either the smallest or largest in any group. This point has now been checked experimentally and the findings are presented below.

A batch of twenty inbred 'Strong *A*' mice of 12 weeks age were taken. Apart from this selection on an age basis no further selection was undertaken. The animals were treated individually and for each one the total body-weight and total liver (less gall bladder) weight were recorded. Using slices from the liver (85–140 mgm.) the —SH content was determined by the method described by Calcutt and Doxey[2]. The —SH content was calculated as a value per 100 mgm. wet weight of liver and also as total liver content. No correlation whatever was detectable between the total body-weight and liver-weight or between total body-weight and total liver —SH. However, a plot of total body-weight against the —SH value per 100 mgm. of liver (wet weight) appeared as in Fig. 1. The apparent inverse relationship between body-weight and —SH per unit mass indicated by this figure is in keeping with the impression gained in earlier work as —SH values were calculated on a unit mass basis during those experiments.

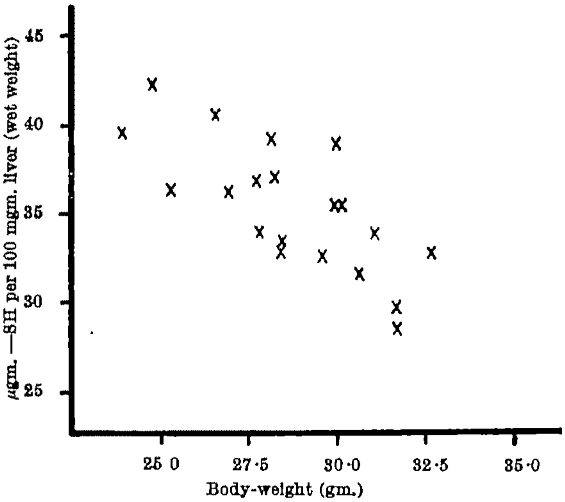

Fig. 1. —SH per 100 mgm. of liver (wet weight) against total body-weight. 'Strong *A*' males

As confirmation of these findings a parallel experiment has been carried out using a batch of 20 female 'Strong *A*' mice. The age of this group was 20 weeks. Once again no correlation could be determined between total body-weight and liver-weight, or between total body-weight and total liver —SH level. The plot of body-weight against liver —SH per 100 mgm. wet weight of liver is shown in Fig. 2. In this case the body-weights fell within a more restricted range than in the case of the males and the liver —SH values showed a wider scatter. Nevertheless, a similar inverse relationship between body-weight and —SH level per unit mass is apparent.

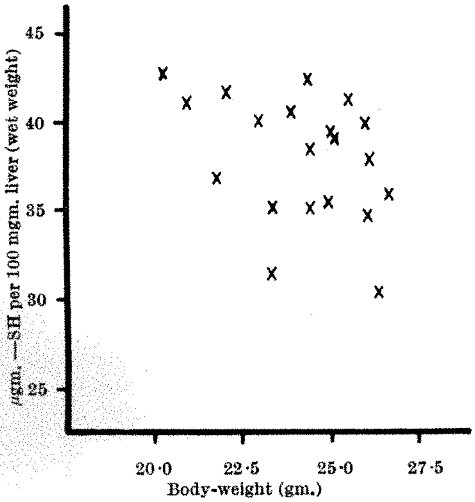

Fig. 2. —SH per 100 mgm. of liver (wet weight) against total body-weight. 'Strong *A*' females

The relationship found in the above experiments is a rather puzzling one and the only suggestion to explain it is the following. Unit masses of the various livers from any one group of animals contain approximately equal numbers of cells and it is the —SH level per cell which varies inversely with body-weight. Since the cell is a balanced biochemical system these findings suggest that other cell constituents may also vary in level according to body-weight. Such a consideration leads to the conclusion that, for biochemical work involving measurements of small differences, all animals used should be carefully selected on the basis of both age and weight.

Essential Fatty Acids of Normal and Atherosclerotic Aortas from Chickens receiving Differently Saturated Fats for Three Years

SINCLAIR's suggestion[1] that atherogenesis may be associated with a relative essential fatty acid deficiency has received considerable attention in many laboratories. On the basis of fatty acid analyses of atheromatous plaques, several investigators have concluded that Sinclair's hypothesis is not substantiated[2,3]. Very recently, Sinclair[4] has joined issue with those who drew these conclusions by suggesting that the fatty acid analytical techniques employed do not differentiate between the essential fatty acids (linoleic and arachidonic) and non-essential fatty acids of similar unsaturation. Although in the present study no attempt was made to differentiate between linoleic and arachidonic acid on one hand, and other di- and tetra-enoic acids on the other, the results herein presented may contribute to a better understanding of the relationship between essential fatty acids and plaque formation.

Three groups of 12-week old Leghorn pullets were fed for three years on: (1) a standard low fat laying ration; (2) the same ration supplemented with 10 per cent corn oil; or (3) supplemented with 10 per cent animal tallow. After killing the hens at the end of three years on the above diets the aortas were removed from the heart to the iliac bifurcation, cleaned of adhering tissue and visually scored[5]. Since significant plaque formation affects primarily the abdominal region of the aorta only this segment was used for the fatty acid analyses. From each of the three fat treatment groups four abdominal aortic segments with the severest atherosclerotic involvement (out of a total of 15–17 per group) were carefully dissected into plaque and clear areas. Lipids were extracted with chloroform/methanol (2 : 1) from the pooled plaque and clear tissues as well as intact abdominal segments from the three treatment groups showing little or no atherosclerotic involvement, the extracts filtered and analysed for iodine numbers and polyunsaturated fatty acids by the methods of Luddy *et al.*[3] and of Morris and Riemenschneider[6].

The results of these analyses are shown in Table 1. It can be seen that in all but one instance the di- and tetra-enoic fatty acid concentration of the lipids from the plaque areas was lower than for the clear areas from the same aortic segments. However, even the concentration of these fatty acids from the clear areas was lower than for the non-affected abdominal segments. Table 1 further shows that there is an inverse relationship between the severity of the atherosclerotic involvement (visual score) and the level of essential fatty acids in the plaque tissue. While these observations lend support to Sinclair's original suggestion, the fact that considerable atherogenic development occurred even in the birds fed with corn oil the aortas of which contained a comparatively high essential fatty acid concentration, would strongly suggest that plaque formation does not owe its origin to an essential fatty acid deficiency.

Table 1. FATTY ACID COMPOSITION (PER CENT) OF LIPID EXTRACT FROM ABDOMINAL AORTAS OF CHICKENS FED DIFFERENTLY SATURATED FATS FOR THREE YEARS

Fatty acids	Abdominal aortic tissue								
	Unaffected			Affected					
				Plaque area			Clear area		
	No fat	Corn oil	Animal fat	No fat	Corn oil	Animal fat	No fat	Corn oil	Animal fat
Saturated	56·9	56·2	51·6	74·2	54·9	50·1	56·5	46·3	45·5
Monoenoic	26·9	14·7	35·0	17·8	27·1	35·6	30·7	33·0	42·3
Dienoic	*12·0*	*22·2*	*10·3*	*6·2*	*15·5*	*11·4*	*10·1*	*17·4*	*9·7*
Trienoic	0·9	1·2	0·9	0·7	0·9	1·2	1·0	0·9	0·7
Tetraenoic	*1·5*	*1·6*	*1·5*	*0·6*	*1·0*	*0·9*	*1·0*	*1·8*	*1·0*
Pentaenoic	0·2	0·2	0·2	1·0	0·1	0·2	0·2	0·2	0·2
Hexaenoic	0·5	0·5	0·5	0·4	0·5	0·6	0·4	0·4	0·6

Visual scoring: 1 = unaffected; 6 = most severe involvement. Scores for the affected abdominal aortas were: No fat, 3·0; corn oil, 2·2; animal fat, 2·3.

HÆMATOLOGY

Elevation of Serum Haptoglobin in Rabbits in Response to Experimental Inflammation

NORMAL human serum contains sufficient haptoglobin to bind approximately 130 mgm. of hæmoglobin per 100 ml. (ref. 1). A number of other mammalian species, including the rabbit, have much lower serum haptoglobin-levels[2]. In order to have available a plentiful source of rabbit haptoglobin a method was sought by which the normal serum level could be elevated. Observations on patients with various diseases suggested that tissue inflammation might provide a means to this end[3]. Accordingly, the effect of administering turpentine to rabbits was investigated.

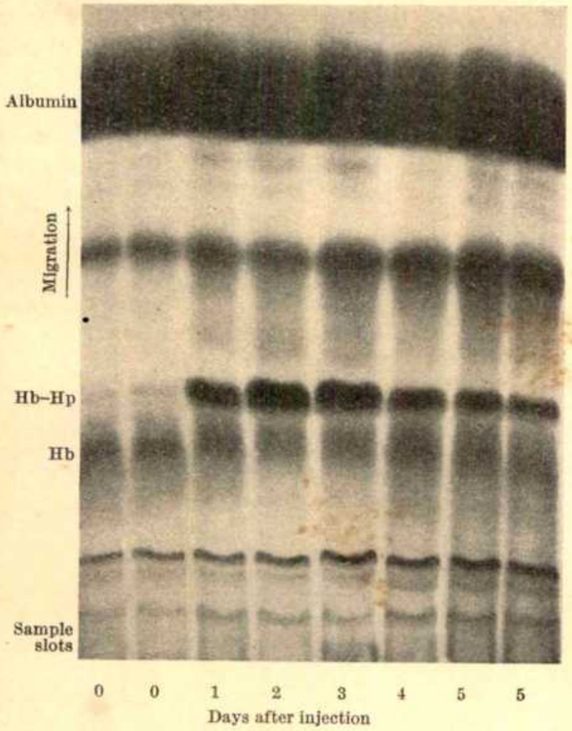

Fig. 1. Starch-gel electrophoresis (ref. 5) of serum samples from a rabbit following injection of turpentine. The buffer composition was 0·021 *M* boric acid 20 per cent neutralized with sodium hydroxide. Hæmoglobin was added to all samples in amounts sufficient to bind all free haptoglobin. The samples on the two edges of the gel are duplicates of the neighbouring samples. The position of the hæmoglobin zone is indicated by the symbol Hb, the hæmoglobin–haptoglobin zone by Hb–Hp

The range of serum haptoglobin concentration[4] in 32 rabbits was 2–35 mgm. with a mean of 10 mgm., expressed in milligrams hæmoglobin-binding capacity per 100 ml. Fifteen rabbits of various ages received a 1-ml. dose of turpentine injected subcutaneously in the dorsolumbar region. In these animals the serum haptoglobin concentration increased to 150–300 mgm. per 100 ml. The rise began at approximately 12 hr. after injection and reached a peak at 48 hr. The level afterwards decreased and fell to one-half of the maximum in 2½–3 days.

The changes in starch gel electrophoretic pattern[5] following turpentine injection are illustrated in Fig. 1. Although the increase and subsequent decrease in the hæmoglobin–haptoglobin zone is the most striking feature, there are changes in several other zones, particularly in those migrating between albumin and the hæmoglobin–haptoglobin complex. Analysis of serum samples for total protein-bound carbohydrate[6] and total protein[7] were also performed. Serum glycoprotein concentration doubled during the initial 48 hr. after injection. More than half the increase of the serum glycoprotein at 48 hr. could be attributed to haptoglobin. No appreciable changes in the total serum protein level were observed.

Whether the rise in haptoglobin represents net synthesis or liberation of pre-formed haptoglobin has not been elucidated. The site of synthesis or of liberation also remains unknown. However, it is unlikely for the following reasons that the haptoglobin is released into the blood at the site of injection: (1) the haptoglobin-level of exudate withdrawn from the site of injection at 24 and 48 hr. was found to be much lower than the haptoglobin-level of serum; (2) the injection of 2·0 *N* hydrochloric acid which caused local ulceration failed to produce marked elevation of serum haptoglobin; (3) when repeated daily injections of turpentine were administered to one rabbit at different sites, the maximum level of haptoglobin and the rate of disappearance were within the limits observed when only a single dose was given. These observations suggest that a tissue pool of haptoglobin may exist normally, possibly in the liver, and that the protein is released into the blood stream in response to inflammation.

Effect of Manganese Edetate on Blood Formation in Rats

It has been reported by Sullivan[1] that anæmia developed in immature rats fed on a diet containing those metallic complexes of edetic acid having stability constants lower than ferrous iron, the anæmia being preventable by simultaneous iron injections. Other authors[2-4] had reported that these complexes given to adult rats orally or by injection produced no alteration of the blood picture compared with controls. It seemed probable therefore that the chelates were capable of producing an iron deficiency anæmia in immature rats but less readily or not at all in adult animals, and this problem has been further investigated.

Control and treated groups of rats were matched according to age and sex, and received a diet of powdered rat cubes with water to drink *ad lib.* Treated rats received, in addition, 4 per cent manganese edetate in the diet. This complex has a stability constant slightly lower than ferrous iron, which it would thus be expected to chelate, but somewhat higher than complexes formed by sodium, magnesium and calcium, so that any abnormalities in treated rats due to deficiency of these cations would be avoided. Blood for investigation was obtained either by amputating the tip of the tail or by decapitation under ether anæsthesia.

Table 1 shows the results obtained. Group 1 consisted of adult rats treated for 50 days. Although there was a significant difference between the hæmoglobin values of control and treated rats, those of the treated animals were only slightly reduced, and no other abnormalities in the blood picture were discovered.

Groups 2 and 3 consisted of young immature rats which were treated for 50 and 40 days respectively. The hæmoglobin values of treated animals were much lower than controls in both groups, particularly in the more immature rats in group 3. The red cells of treated rats in group 2 were microcytic. The mean corpuscular hæmoglobin concentration of treated animals in group 3 was significantly lower and the blood film confirmed a hypochromic anæmia.

After 50 days treatment with manganese edetate, rats in groups 1 and 2 were returned to a normal diet for 30 days. Blood investigations were then repeated, and no significant differences between treated and control rats remained.

In these experiments, a severe but reversible iron deficiency anæmia was produced among immature but not adult rats. The more immature the rats, the more severe was the anæmia. Previous results[1] indicate that this effect can be produced by many heavy metal chelates less stable than ferrous edetate. There are reports that manganese may affect blood formation but these are contradictory[5].

All animals gained weight, although the gain of treated rats in group 3 was poor compared with their controls. Taste cannot be excluded as a cause for this since rats were not pair-fed. This group of rats also differed from the others in that they had just been weaned.

I wish to thank Prof. R. S. Stacey and Dr. M. S. R. Hutt for advice and assistance, and Dr. J. K. Aiken of the Geigy Co., Ltd., Manchester, for supplies of manganese edetate.

Rivanol in the Preparation of Plasminogen (Profibrinolysin)

The most commonly used technique for preparing plasminogen is that worked out by Kline[1] using fraction III as a starting material. Plasminogen seems to be a rather resistant protein, for extreme *p*H's are used in the above-mentioned method. It would be interesting to compare the profibrinolysin prepared by the Kline technique with a product obtained by a completely different method.

Rivanol (diamino-ethoxyacridine lactate) has been used for the preparation and purification of several plasma proteins such as γ-globulin[2], β_1-metal combining globulin[3], ceruloplasmin[4], haptoglobin[5] and thrombin[6]. So we were interested to study the behaviour of plasminogen during subfractionation of fraction III by rivanol.

The fibrinolytic activity of each sample obtained after streptokinase activation ('*SK* Diamant') is measured by a technique using purified and relatively plasminogen-free fibrinogen (Kekwick *et al.*[7]) and thrombin (unpublished) preparations following the technique of Kowalski *et al.*[8]. Small concentrations of rivanol do not interfere with the detection of fibrinolytic activity. Samples freed of the acridine derivative by treatment with charcoal at *p*H 8·5 showed almost the same activity.

Ceruloplasmin can be prepared, as recently described[4], by treating fraction III with rivanol. We found that plasminogen is precipitated together with ceruloplasmin as revealed by the screening test for fibrinolytic activity.

The rivanol–protein complex obtained in step 2 is dissociated at *p*H 4 and 50 per cent alcohol concentration. The precipitate is then extracted by acetate buffer 0·5 *M*, *p*H 6·5 (final *p*H 5·9). This solution contains ceruloplasmin but has no fibrinolytic activity. The plasminogen is not destroyed and is still present in the bulk of denatured proteins. Plasminogen is more soluble in dilute salt solutions and so we treated the precipitate remaining after the extraction of ceruloplasmin by dilute saline at pH near neutrality.

This saline extract freed from rivanol by treatment with charcoal at pH 8·5 is highly active as shown by fibrinolytic activity tests.

Further work is in progress and will be published elsewhere.

PLANT PHYSIOLOGY

Specific Interaction of Native Protein and Inorganic Salts

Under the action of certain inorganic salts, native serum proteins release a phytohormonal fraction inhibitory to the growth of plant roots, as may be seen by comparing Fig. 1 with Fig. 2.

Fig. 1 shows the average increment in millimetres in 24 hr. of roots of *Lupinus albus* (the Macht–Livingston technique[1]) grown in nutrient solutions containing five different concentrations of serum in five independent experiments, that is, one with each concentration of serum. The nutrient solutions were made up of 1–10 per cent serum (v/v) diluted partly with water and partly with a well-balanced triple-salt solution consisting of 2·5 mM calcium nitrate, 7·5 mM magnesium sulphate and 9·0 mM potassium dihydrogen phosphate (after Shive[2]). The serum originated from five different samples of blood, one for each experiment, taken from the same proband.

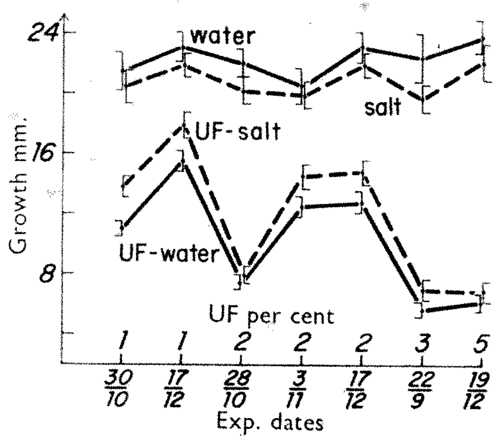

Fig. 2. Growth of roots in water and salt solutions with or without addition of an ultra-filtrate of denatured serum in six independent experiments (two ordinate values are partially common in one experiment (December 17, 1958)). Ordinates: growth in mm. in 24 hr. at 15° C.; abscissæ: (1) dates of experiments (1958), (2) percentage (v/v) of ultra-filtrate (UF) in water or salt solution in two lower curves. Ultra-filtrate of serum from various probands, freshly taken the day before each experimental date. Vertical transverse lines on curves: 95 per cent fiducial limits

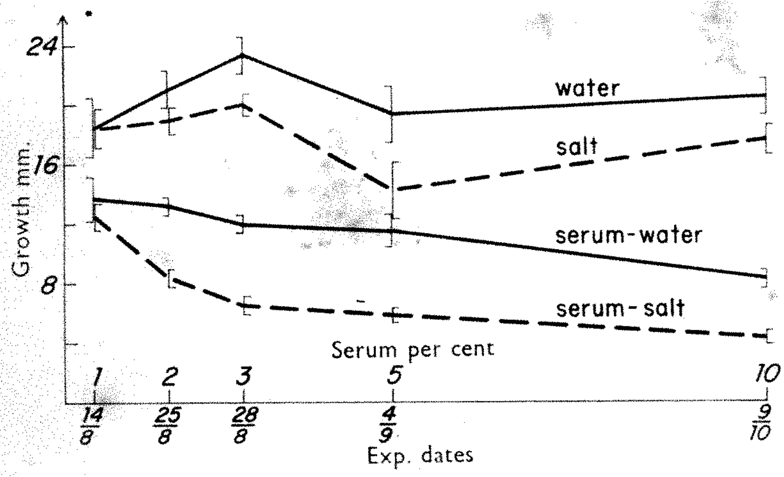

Fig. 1. Growth of *Lupinus albus* roots in water and salt solutions with or without serum added, in five independent experiments. Ordinates: growth in mm. in 24 hr. at 15° C.; abscissæ: (1) dates of experiments (1958), (2) percentage (v/v) of serum in water or salt solution in the two lower curves. Serum from one proband, freshly taken on each experimental date. Vertical transverse lines on curves: 95 per cent fiducial limits

The curve marked 'water' in Fig. 1 shows the increment in distilled water, while that marked 'salt' indicates the increment in the triple-salt solution. As previously demonstrated by Ekdahl[3] and by me[1], in a 24-hr. experiment in water the increment is greater or of the same order as in the triple-salt solution. The vertical transverse lines on the curves indicate fiducial limits at the 5 per cent level (variation within experiments).

The curves marked 'serum–water' and 'serum–salt' show the growth in water and in the triple-salt solution, respectively, with serum added at the concentrations indicated on the axis of abscissæ. The curves marked 'serum–water' and 'serum–salt' are at a lower level than the 'water' and 'salt' curves, indicating that serum causes reduced growth of the roots.

Fig. 1 thus clearly shows two effects, namely, (1) a salt–root effect and (2) a serum–root effect. A third effect is also shown in Fig. 1, but it is more distinct if the values of the 'serum–water' curve in Fig. 1 are converted into percentages of the values of the 'water' curve in Fig. 1, while the values of the 'serum–salt' curve in Fig. 1 are converted into percentages of the values of the 'salt' curve in Fig. 1. As percentages, the values of the 'serum–salt' curve fall below those of the 'serum–water' curve.

Is this third effect due to a salt–root action, so that the sensitivity of the roots to serum action has been changed in the saline dilution, or is it due to a salt–serum action?

The answer must be sought in Fig. 2, which shows the results of six growth experiments, in which an ultra-filtrate (UF) of a heat-denatured 33 per cent serum–water solution has been used as nutrient medium, diluted partly with water and partly with the triple-salt solution already mentioned. The concentrations of the ultra-filtrate in the solutions are plotted as abscissæ, the solutions having been diluted so that the percentages refer to the original serum concentration before heat-denaturation and ultra-filtration. By heat-denaturation all bound phytohormones will be released from the serum proteins[4].

Like the curves in Fig. 1, those in Fig. 2 also show three effects. Two of these, namely, (1) a salt–root effect and (2) a ultra-filtrate–root effect, correspond to the salt–root effect and serum–root effect already mentioned. The third effect shown in Fig. 2 is that the increment in the ultra-filtrate–salt solution constitutes a higher percentage of the increment in the salt solution without ultra-filtrate, as compared with the percentage which the increment in ultra-filtrate + water constitutes of the increment in water without the ultra-filtrate. This third effect in Fig. 2, where an ultra-filtrate of denatured serum is used as a specific nutrient medium, is thus directly contrary to the corresponding effect in Fig. 1, where native serum is used as a specific nutrient medium.

The *p*H of the solutions cannot be the cause of the difference recorded in the activity of native serum on one hand and an ultra-filtrate of denatured serum on the other, since all solutions containing Shive salt have a lower *p*H value than the corresponding solutions in which distilled water is used as diluting agent. In Fig. 1 the most acid serum–salt solution has thus the greatest root-growth inhibition, whereas in Fig. 2 the most acid ultra-filtrate–salt solution has the smallest root-growth inhibition.

An ultra-filtrate of denatured serum contains all its phytohormones in the free, unbound form, whereas native serum contains most of its phytohormones in the bound form[4]. Since a nutrient solution in which all phytohormones are found in the free form (the curves with ultra-filtrate in Fig. 2) has thus shown an effect contrary to that of a nutrient solution in which the same phytohormones are present in partially bound form (the curves with serum in Fig. 1) but where otherwise all other factors are alike, the difference must be due to the serum protein component in Fig. 1. In an experimental arrangement analogous to that of the experiments in Figs. 1 and 2, four experiments with varying concentrations of urine, which, in some respects, may be regarded as an ultra-filtrate of serum, have shown the same effect as found in the experiments with an ultra-filtrate of denatured serum. This also suggests that the difference between the results shown in Figs. 1 and 2 is due to the protein component in the nutrient solutions in Fig. 1.

That native serum diluted with a salt solution has thus shown the greatest inhibition of root growth, relatively as well as absolutely, compared with its effect when diluted with water, must therefore be interpreted as being due to a protein–salt effect rather than to a salt–root effect.

Since phytohormones can only be imagined to affect roots when present in the free form, the increased phytohormonal effect in serum diluted with a salt solution must be due to the fact that the salts release quantities of phytohormones from the native serum proteins.

For grants enabling me to carry out the present work, I am indebted to the P. Carl Petersen's Foundation and the Johan Weimann, Merchant of Odense, and Hanne Weimann, *née* Seedorff, Foundation.

2,6-Dichlorobenzonitrile: a New Herbicide

IN the course of a screening programme investigating the herbicidal activity of various benzonitriles and related compounds it was found that many of these substances inhibited the growth of young oat plants and the germination of seeds of many weed species.

The most active compound in this series proved to be 2,6-dichlorobenzonitrile (code No. *H* 133). The germination of seeds is especially inhibited by very small amounts of *H* 133. This inhibition is illustrated in Fig. 1, where millet seeds (*Panicum miliaceum*) have been sown on a 2 per cent agar containing the indicated amounts of 2,6-dichlorobenzonitrile per ml. The tubes contained 10 ml. of the agar solution. A concentration of 5×10^{-5} mgm. of *H* 133 per ml. strongly inhibited germination. In a comparison with *iso*propyl-N-phenylcarbamate (I.P.C.), the same degree of inhibition occurred at a dose of about 5×10^{-3} mgm.

H 133 is easily absorbed by seeds either from a solution or from the vapour. In laboratory experiments the germination of wild oats was completely inhibited if flats were sprayed with amounts of *H* 133 corresponding to doses of 0·5–4 kgm. per hectare depending on the type of soil. Seeds of some plant species, for example, rice, groundnuts, maize and sunflower, showed a distinct resistance to *H* 133.

Besides inhibition of germination the effects of *H* 133 appear in general killing or stunting the growth of young plants. Older and also full-grown plants were not damaged by this compound. After application of small amounts of *H* 133 various effects on plants could be observed. Growing tips are obviously very sensitive to this compound. *H* 133 thus acts via the roots as well as by way of the green parts of the plants.

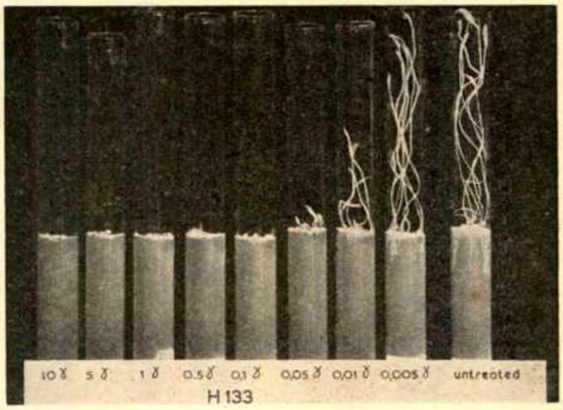

Fig. 1

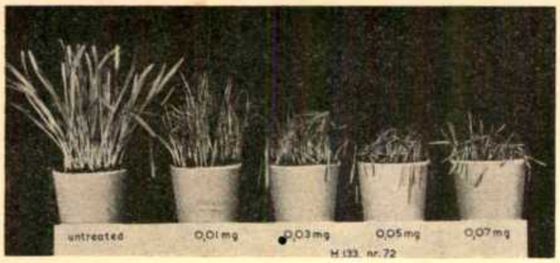

Fig. 2

When applied in a lanolin paste to the stem of bean plants a local swelling of the stems occurred, mainly caused by an increase in diameter of the parenchyma cells. The stems of sunflower and groundnut plants also showed a characteristic swelling. In plants like tobacco and *Salvia*, leaf growth is inhibited simultaneously with an increase in thickness of the leaf.

H 133 is very active in vapour form, in spite of the low vapour pressure (3×10^{-6} mm. mercury at 20° C.). A characteristic effect is illustrated in Fig. 2, where young oat plants were exposed to the vapour of *H* 133 during 24 hr. by covering them with glass bells containing in the top a piece of filter-paper with a certain amount (0·01–0·07 mgm.) of *H* 133. The young leaves toppled over and all cells in the actively growing meristems collapsed (Fig. 2).

The same effect may be observed under appropriate conditions 10 min. after spraying the plants.

Sprouting of stored potato tubers is completely inhibited by exposure to *H* 133 vapour.

In an *Avena* coleoptile section test an antiauxin effect was observed. Concentrations of 10^{-4} mgm. of *H* 133 per 0·5 ml. buffer inhibited the growth stimulation of 10^{-3} mgm. of indole acetic acid per 0·5 ml. buffer solution.

Experiments in which respiration or photosynthesis was measured in a Warburg apparatus showed that neither respiration nor photosynthesis of tobacco leaves was inhibited, if the leaves were placed in a saturated solution. The solubility of *H* 133 in water is 18 p.p.m.

A specific effect of *H* 133, for example, the toppling over of young oat plants, was not observed, if known herbicides, as phenoxyacetic, phenylacetic or benzoic acids, were used. On the other hand, leaf modifications as caused by phenoxyacetic and benzoic acids have never been shown.

The acute toxicity of *H* 133 for warm-blooded animals is low. The acute oral *LD*50 for mice is >6 gm./kgm. body-weight; the acute intraperitoneal *LD*50 for mice is >3 gm./kgm. body-weight.

These effects of *H* 133 indicate its possibilities as a herbicide. It is active against many weeds, for example, wild oat (*Avena fatua*), bracken (*Pteridium aquilinum*), chickweed (*Stellaria media*) and cleavers (*Galium aparine*), whereas some crops have proved resistant to it.

A full account of these investigations will be published elsewhere.

Volvox Colonies and Snail 'Cytase'

HAVING seen the very striking way in which snail 'cytase' brings about the dissolution of cell walls in angiosperm roots (following the suggestion for its use in cytological techniques[1]), I wondered what effect this substance might have on a colonial organism such as *Volvox*. Would it be possible to separate the cells of the colony into a swarm of *Chlamydomonas*-like creatures, or, better still, would it be possible to liberate the protoplasts as free-swimming naked individuals?

Small quantities of a culture of *Volvox aureus* Ehr. were placed in watch glasses and sufficient of the coffee-coloured 'enzyme' (obtained from the crop of the edible snail) was added to each to bring the strength of the enzyme up to about 20–25 per cent of the total bulk of the liquid.

The treated colonies were kept at room temperature and examined under the microscope from time to time for up to three days. At no time did any of them show any signs of separating into individual free cells. The only visible effects of the treatment were (*a*) the production of one or more large dimples in most of the colonies, presumably due to slight plasmolysis, and (*b*) a slight swelling of the outer region of each colony.

The ability of the colonies to resist dissolution was quite unexpected, especially since the 'enzyme' is known to contain at least twenty constituents capable of acting on a wide range of carbohydrates. As a check on the activity of the snail enzyme under the conditions and at the dilution described above, a little ground wheat endosperm was added to some of the watch glasses after 12–24 hr., and in each case both the starch grains and the cellulose endosperm walls were readily dissolved.

Thus although it is possible to obtain a positive cellulose reaction on *Volvox* by treatment with iodine and sulphuric acid, it seems that in the living condition the material forming the matrix of a colony must either be very different from that of the walls of higher plants, or it must be protected in some way by the incorporation of some substance (such as protein) which is not attacked by the snail enzyme.

I wish to thank Miss E. H. Evans for supplying the snail enzyme and the Cambridge Culture Collection for the culture of *Volvox aureus*.

RADIOBIOLOGY

Significance of Adrenals for Increased Oxygen Consumption in Rats during Irradiation

THE first minute of exposure to ionizing radiation produces in animals many changes which may be explained as stress reaction. In my previous communication I had shown a significant increase in oxygen consumption in rats during irradiation with a dose-rate of 50 r./min.[1]. Since I believe that this increased oxygen consumption is a demonstration of stress reaction too, I should like to explain the role of adrenals in these changes in the following experiment.

I used 60 female rats (Wistar strain), average weight 200 gm. Bilateral adrenalectomy was performed on 50 rats, sham operation on 10 rats. The adrenalectomized rats were fed on a standard Larsen diet and drinking water was replaced by saline solution. The division in groups was as follows: (1) experimental group: (adrenalectomized, irradiated rats) (40 rats); (2) control group: (adrenalectomized rats without irradiation) (10 rats); (3) control group: (sham operated, irradiated rats) (10 rats).

The methods of measuring and irradiation was described in my previous communication[1].

The course of oxygen consumption in experimental and control rats is given in Fig. 1. In all irradiated groups, the oxygen consumption was already significantly increased in the first minute of irradiation with a dose-rate of 50 r./min. The difference in oxygen consumption between group 1 and group 2 is statistically significant ($P < 0{\cdot}01$). The oxygen consumption in rats after sham operation has increased much more ($P < 0{\cdot}005$) than in the experimental groups.

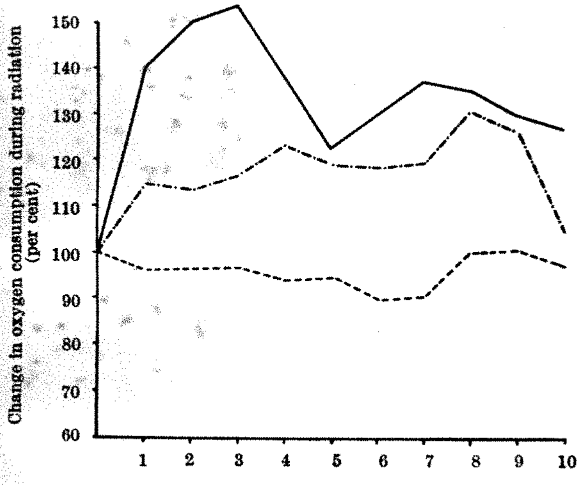

Fig. 1. ——, Sham operated, irradiated rats; —.—.—, adrenalectomized, irradiated rats; — — —, adrenalectomized, non-irradiated rats

As oxygen consumption was increased during irradiation in all adrenalectomized rats I believe that an increase in oxygen consumption could not be explained as the influence of accidental accessory suprarenals. In accordance with Selye's experiments, I do not exclude the possibility that the changes in oxygen consumption during irradiation are a manifestation of radiation stress[2].

The difference in the increased oxygen consumption during irradiation, both in experimental and control irradiated rats, indicated that the change in oxygen consumption is higher in presence of the adrenals. I assume that adrenals, too, take part in the increasing oxygen consumption. But the velocity of the increase in oxygen consumption in the first minute of irradiation rather indicates a presumably reflex mechanism of these changes. I suggest that the increase in oxygen consumption has been produced, on one hand, by a direct influence of the nervous system on tissue metabolism, and, on the other hand, these changes are later accompanied by humoral factors.

Hazard of Tritium as a Deoxyribonucleic Acid Label in Man

IN the Recommendations of the International Commission on Radiological Protection[1,2] (1955, 1960) on maximum permissible body burden, tritium is considered only in water which is widely and uniformly distributed throughout the body. It is pointed out in the Recommendations that great care must be taken in applying these data to other chemical forms which may give a different localization. However, this fact is still not always appreciated and although it is particularly serious for tritium. The average range of its beta-particles is only about 1μ (maximum range about 7μ) and the local dose-rate will have reached about half the maximum for a deposit of isotope in a volume of the order of only $10\mu^3$. Further, an increased relative biological effectiveness is to be expected for these low-energy beta-particles compared with gamma radiation, and from observations of radiation effects on cell growth, Pinson and Langham[3] have suggested that a value of 1·7 should be used.

One of the frequent applications of tritium is in labelling precursors of deoxyribonucleic acid such as thymidine. These will be taken up specifically by the limited number of cells in the period of synthesis of deoxyribonucleic acid prior to division. The radioactive material will then be associated with the chromosomes and will produce local irradiation of an essential part of the cell, being particularly likely to interfere with division or to produce gene mutations. A concentration of only 0·03 μc./gm. within a nucleus of $500\mu^3$ could deliver a dose of 0·06 rad (0·1 rem) in one week within that nucleus, and such an uptake in some 10^{12} dividing cells would constitute a body burden of 15 μc. (ref. 4) only 1/167 of the latest International Commission on Radiological Protection value[2].

We have directed attention to the possibility of appreciable radiation effects from the amounts of tritium-labelled thymidine used in autoradiography[4,5]. In fact, marked toxic effects have been observed in tissue culture by Osgood[6], and by Painter and Drew[7], who reported that 0·1 μc./ml. medium for 24 hr. or 0·02 μc./ml. medium for 72 hr. resulted in the death of 90 and 50 per cent of cells respectively.

Painter, Drew and Hughes[8] compared the effects of tritium-labelled water and tritium-labelled thymidine in the medium for 24 hr., on the inhibition of growth of Hela cells. Comparable depressions were produced by 5,000 μc./ml. medium and 5 μc./ml. respectively. Allowing for a relative biological effectiveness of 1·7 this implied a 'concentration' factor of 590/1. This is a greater difference than suggested above in connexion with body burden; but it must be realized that in this latter case the dose of 0·1 rem was averaged over the total nuclei incorporating the material. However, the range of the particles is so short that the radiation effect is limited to small volumes even within these nuclei. A particle of the average energy (0·055 MeV.) can be considered to dissipate this energy within a sphere of only 1μ diameter, corresponding to a dose within this small volume of some 168 rads (286 rems if a relative biological effectiveness of 1·7 in fact applies), so that a single particle is capable of producing very marked radiation effects within its limited range. This represents 5–10 times more energy than would be left in a similar volume, adjacent to the point of emission, by the first part of the track even for a beta-particle from carbon-14, and the difference is even greater for particles of higher energy.

Johnson and Cronkite[9] have found comparable radiation effects on mouse spermatogonia *in vivo* at 60 hr. after an injection of tritium-labelled thymidine 1 μc./gm. of body-weight, or a single dose of 5 r. of gamma radiation. This amount of tritium is about that needed to produce a good autoradiograph of cellular uptake, which requires some 6 × 10^4 atoms per nucleus of 500μ^3 volume corresponding to some 6 μc./gm. of nucleus[4]. Thus, a concentration factor of the order of 10 applies in this case between the concentration of thymidine in nuclei and in whole body; but, of course, the uptake in any particular type of cell will depend on the local pool of thymidine, which will vary from tissue to tissue[10]. An average concentration of 6 μc./gm. will give a dose of 4 rads (or 6·8 rems) per 60 hr., which is, in fact, similar to the observed equivalent gamma radiation dose.

There would be a difference between the cells initially receiving damage in these two cases. Gamma radiation would damage a certain proportion of all cells at random, although this damage might not become obvious until the cells attempted division at some later time. Following a single injection, thymidine would be taken up specifically by cells already preparing for division and only these cells would initially show damage. However, the nature of the tritium localization in chromosomes of dividing cells would favour production of mutations (with consequent risk of carcinogenesis, leukæmia, etc.). Further, although there are at present no data on the biological half-life of deoxyribonucleic acid pyrimidines *in vivo*, it is known that deoxyribonucleic acid purines from damaged cells are re-utilized efficiently for synthesis of deoxyribonucleic acid[5]. In the event of tritiated thymidine being given continuously, all dividing cells would in the end receive radioactive material, and, if there is appreciable re-utilization of material, the maximum cell content could gradually increase.

Thus, the particular nature of uptake and the lack of knowledge on local pools and re-utilization make it very difficult to lay down any maximum permissible body burden for tritiated thymidine. It is certain that appreciable organ radiation effects may be observed after even the low doses necessary for autoradiography. However, in general, with tritiated deoxyribonucleic acid precursors the main concern is not with organ damage (as only the proportion of cells in synthesis of deoxyribonucleic acid at the time of administration will be affected), but rather with mutagenic effects in those cells which have a long life span and several mitotic cycles in the body (for example, bone marrow stem cells and any 'stem' population). In these cells it is meaningless to consider rads per nucleus, as the uneven distribution of energy within the nucleus may or may not affect a vulnerable volume by chance.

BIOLOGY

Age Determination in the Harbour Seal, *Phoca vitulina* L.

RECENT detailed investigations of the life-histories of several arctic and antarctic phocids[1–3] have established the use of incremental layers in the dentine and cementum of canine teeth as accurate indicators of age. Such studies have relied on seasonal differences in the rate and type of deposition for determining the annual nature of the layers, but so far as we are aware, the results obtained have never been validated by examination of teeth from an animal of known age.

Recently, we acquired from Dr. Victor B. Scheffer and Mr. Dale W. Rice, of the U.S. Fish and Wildlife Service, the right upper canine of an old adult male harbour seal from the Seattle Zoo. This animal had been kept in captivity since its capture as a pup, and its age was therefore known to within a few months.

The tooth is illustrated in longitudinal section in Fig. 1, which shows that the bulk of the cementum is confined to the lower half. A thin-ground section in the same plane reveals that the cementum contains many well-defined layers, which are better resolved in the transverse section (Fig. 2) cut at the level marked in Fig. 1. Each layer is about 125μ in width and consists of a wide band of opaque cementum and a narrow translucent band. Examination

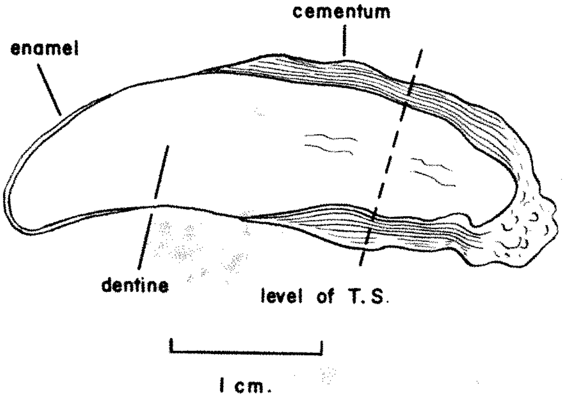

Fig. 1. Diagrammatic longitudinal section of the right upper canine of an old male harbour seal

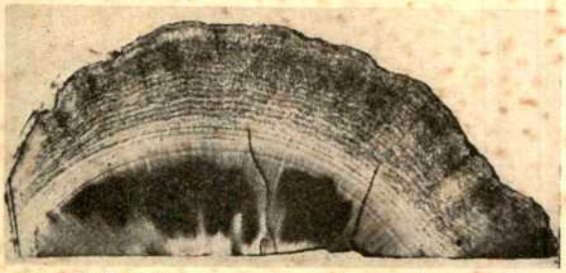

Fig. 2. Half of a transverse section of the same tooth cut at the level shown in the diagram. At least eighteen layers can be counted in the cementum

of other specimens shows that the translucent band is laid down in the spring and early summer and may represent a period of minimal feeding during the breeding period and the moult, as is found in some other phocids[1,3].

Preliminary counts gave the number of cementum layers as 18–20, the lower figure being finally chosen since it was the most certain. After our examination had been made, we learned from Dr. Scheffer that the seal was 19½ years old, a fact which confirmed the annual nature of the cementum layers. There were no clearly marked dentinal layers in this particular tooth, but examination of other canines from both male and female harbour seals has shown that, where dentinal layers are present, they agree in number with those in the cementum.

Anomalies in the Microscopic Structure of Some Wools

THE bilateral division of the cortex of merino wool into ortho and para sections has been clearly shown by many workers[1,2], and can easily be demonstrated by dyeing the fibres with methylene blue at the boil, at pH 7·4. When this experiment is carried out with Southdown or Corriedale fibres the shape of the two portions is often anomalous. Near the division between stained (ortho) and unstained (para) portions there often appears a core, often within the paracortex, but stained more deeply than the ortho. When the experiment is repeated at pH 6 (at which very little segmentation is discernible in Merino) this core remains deeply stained and clearly distinguishable from the ortho-cortex, which is relatively pale (Fig. 1). It is concluded from this experiment, and other similar experiments with fine crossbred wools, that in some types of wool a core more basophilic than the ortho-cortex exists, usually at the junction between the ortho and the para portions, and sometimes completely in the para-cortex. In a sample of Southdown fibres one-third had such a core, and in Corriedale about two-thirds. When whole fibres are examined this core is towards the inside of the curve of the crimped fibre. It is proposed to call this core the meta-cortex.

The position and basophilic nature of this meta-cortex suggest that it might be related to the medulla, but, of course, no medulla is found in these fine crossbred wools. However, when a sample of white alpaca fibres was likewise stained at pH 6, it was possible to pick out fibres with a broken medulla joined by deeply stained cores. When slides of these fibres, viewed in the microscope, were flooded with acetic acid the blue stains of the core disappeared leaving the medulla portions still visible. Occasionally, fibres stained at pH 6 showed a length of core with a few vacuoles along one edge (Fig. 2) and sometimes a concentration of vacuoles at one end. A sample of Masham wool similarly treated showed a mixture of core and medulla similar to that found in alpaca. One fibre showed some portions with two medullæ (as is often found in llama) of which one was continuous throughout, and the other, which was thin, was replaced in portions by a single line of deep blue spindle-shaped cells, sometimes in line and sometimes overlapping. This again suggests a relation between the medulla and the core or meta-cortex.

It would also seem that the three regions of the cortex are different in sulphur content. Thorsen[3] has published pictures of Rambouillet, Suffolk and Navajo wool fibre cross-sections, stained in sodium plumbite, in which there is an unstained core as well

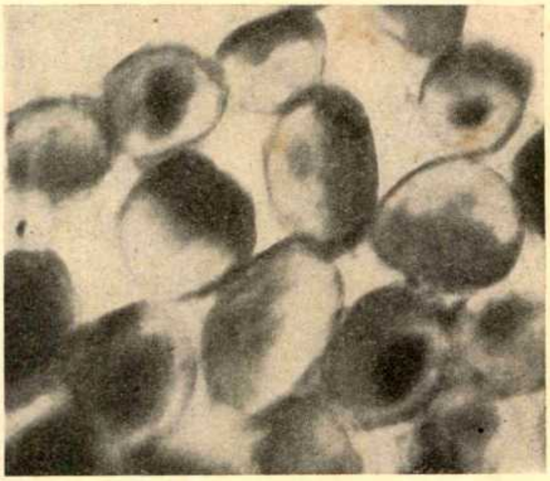

Fig. 1. Southdown wool stained with methylene blue at pH 6

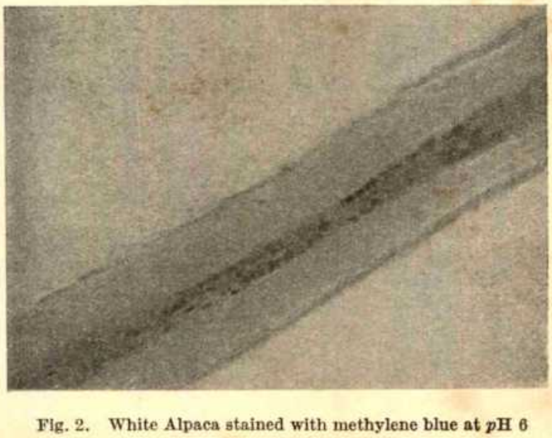

Fig. 2. White Alpaca stained with methylene blue at pH 6

as two regions corresponding to the ortho- and para-cortex. When Southdown and Corriedale fibres are similarly stained in sodium plumbite, some of them exhibit an unstained, sulphur-deficient, core near the junction of the dark brown para- and the light brown ortho-, often within the para-cortex. The fraction of such fibres is similar to the fraction of those showing a meta-cortex when stained with methylene blue at pH 6. A similar phenomenon can be seen in white alpaca stained with sodium plumbite. The medullated fibres (the majority) show a white, sulphur-deficient, ring around the medulla, often within the para-cortex, and unmedullated fibres simply show the white core in the same position. The apparent sulphur deficiency of the meta-cortex and the known sulphur deficiency of the medulla[4] are thus consistent with the association between meta-cortex and medulla noted earlier.

These observations would indicate that the medulla and the meta-cortex may be similarly derived within the fibre follicle.

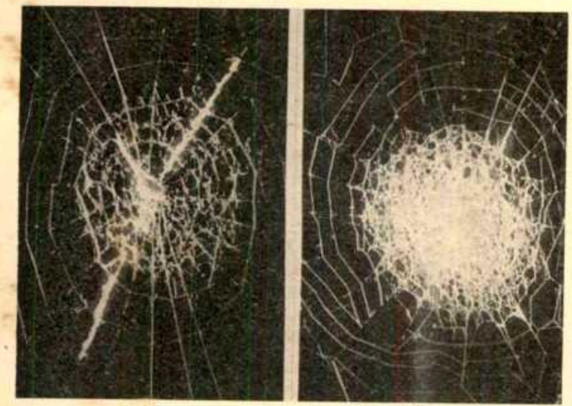
Unusual Web Pattern made by an Unfertilized Female of the Spider *Uloborus walckenaerius* Latreille

A MATURE female of *Uloborus walckenaerius* was found in May 1959 in the precincts of Jerusalem. The female lived about four months in the laboratory and reached a large size; she did not lay eggs and was probably not fertilized.

A few weeks after bringing her into the laboratory an unusual pattern appeared in her web. Besides the usual radial stabilimentum, an additional design appeared, forming a lace-like delicate pattern in the centre (Fig. 1a). During the following days the pattern became denser and its area larger. Towards the end of this process the additional threads completely covered the normal stabilimentum and the whole central area (Fig. 1b). The new formation resembled a compact white spot in the middle of the web, the dense area reaching in some webs about 5 cm. in diameter.



(a) (b)

Fig. 1. Central part of the web of *U. walckenaerius* with additional pattern. *a*, Initial stage; *b*, final stage

After the web was destroyed the spinning process was repeated. The unusual additional stabilimentum pattern appeared in large normal webs as well as in small ones, which resembled primitive cocoon webs. The rate of spinning activities of this unusual pattern is variable.

At the same time some females of another species of *Uloborus* were also found, in outward appearance and size very similar to *U. walckenaerius* but distinctly differing in colour. Unfortunately the species has not so far been determined. One of these females, probably also unfertilized, spun similar additional stabilimentum patterns in her webs. In addition, during July this female spun an unusually large but empty cocoon, resembling in form a typical cocoon of *U. walckenaerius*, and placed it on a cocoon web beside her web. On the fourth day the empty cocoon was torn off (probably by the spider itself) and found lying beneath the web. The spinning of an empty cocoon confirms the supposition that the female was not fertilized.

Both phenomena, the unusual web pattern and the spinning of the empty cocoon, in an unfertilized female show that: (1) increased silk production in the mature female is probably independent of fertilization, and leads to an unusual stabilimentum pattern in the web; (2) making the cocoon may be independent of egg-laying.

Although it is difficult to judge by a single observation of throwing away an empty cocoon, it nevertheless suggests the existence of some action to control the completed cocoon. This latter suggestion needs further investigation.

I am grateful to Dr. A. Shulov for identifying *U. walckenaerius*.

Perfect Stage of *Microsporum gypseum*

IN 1927, Nannizzi[1] reported the discovery of the perfect stage of *Microsporum gypseum* (Bodin) Guiart and Grigoraki and named it *Gymnoascus gypseum* Nannizzi. This work was criticized on a number of grounds, and, as there has been no record of its successful repetition, it has been generally disregarded.

I, by chance, rediscovered this same perfect stage in April 1959 when I noticed the presence of cleistothecia typical of the Gymnoascaceae associated with *Microsporum gypseum* growing on hair resting on the surface of moist soil in a laboratory experiment. This conclusion is supported by the following evidence: (a) macro-conidia of *M. gypseum* were borne directly on the characteristic peridial hyphæ of the cleistothecia; (b) both ascospores and macro-conidia gave rise to colonies producing both the sexual and asexual stage, although the sexual stage was only produced if the fungus was grown on hair mixed with moist soil, in the confirmatory tests the whole system having been sterilized prior to inoculation. Although the cleistothecial characteristics of the present isolate differ in certain respects from Nannizzi's diagnosis of his isolate, the differences are explicable and I regard the two to be conspecific.

The species is only doubtfully a member of the genus *Gymnoascus*, but no change in generic position is proposed as yet. Full details will be published elsewhere.

Considered with the recent discovery of the perfect stage of the closely allied *Keratinomyces ajelloi*[2], the case for the gymnoascomycete derivation of this important group of dermatophytes is strengthened.

Occurrence of the Slipper Limpet, *Crepidula fornicata* L., in Ireland

In May 1959, during an investigation of the intertidal ecology of the Kenmare River, Co. Kerry, full-grown single individuals of this American gastropod were found to be common below mid-tide level at Kilmakilloge Harbour, a shallow and protected inlet on the southern shore of the estuary. This species is well known as a pest of oyster beds on the eastern and southern shores of England, and is also present in Wales[1], but is believed not to have been recorded previously from Irish waters. Studies on the biology of *Crepidula* have shown that distribution on ships is the main, if not the only, means of remote dispersal[2]. It is therefore probable that this species has reached Ireland attached to vessels previously laid up in British harbours. As part of the survey, a special search was also made for the Australasian barnacle *Elminius modestus* Darwin which, though now widespread in Britain[3], has in Ireland only been reported from Lough Ine, Co. Cork[4]. However, *Elminius* was not found anywhere within the Kenmare River, nor was *Crepidula* noted at other localities.

A Mesozoic Microflora from South Africa

In 1948 I examined a specimen of low-grade coal from the Gamtoos River, Eastern Cape Province, South Africa, and found it to be particularly rich in microspores. Carbonaceous mudstones and shales in the Wood Beds of the Uitenhage series in the Gamtoos River basin were afterwards found to contain a comparable, though much less rich, spore assemblage, thus giving a fairly consistent picture of a Mesozoic flora of the region.

At the time of investigation it did not seem possible to name many of the sporomorphs; but owing to the progress in sporomorph taxonomy of the past ten years many can now be named, at least tentatively. Of particular interest are three species of saccate sporomorphs. One of these is similar to, if not identical with, *Pityosporites ellipticus* (Cookson) Balme, a form known from Australia and New Zealand[1]. Another is *Podosporites* c.f. *micropterus* (Cookson and Pike) Balme, this genus being known from India and Australia. Both sporomorphs have been regarded as likely Podocarpaceae. The third is *Caytonipollenites pallidus* (Reissinger) Couper, identical in form with pollen of *Caytonanthus* (Caytoniales) and very likely referable to this widespread group of Mesozoic Pteridospermae[2].

Other sporomorphs include *Classopollis torosus* (Reissinger) Couper, *Tsugaepollenites* sp., *Ginkgocycadophytus* sp., *Cicatricosisporites* c.f. *brevilaesuratus* Couper, and trilete spores resembling those of Cyatheaceae, Dicksoniaceae, Matoniaceae, Schizaeaceae and Gleicheniaceae. A total of about thirty sporomorph species has so far been distinguished.

The age of the Uitenhage Wood Beds is regarded as Wealden[3]. The spore assemblage, so far as it has been studied at present, is quite consistent with this, though not proving it, as the microflora is typically mid-Mesozoic, closely comparable with Upper Jurassic and Lower Cretaceous ones and apparently lacking certain forms which seem to be typical of the Lower Cretaceous of Australia, such as *Cicatricosisporites australiensis* (Cookson) Balme and *Microcachrydites antarcticus* Cookson.

Mid-Mesozoic microfloras of South Africa have not been investigated, and the present study suggests some resemblances to both northern and southern floras of about the same age, that is to say, a southern and a cosmopolitan element are present. In view of the occasionally mooted theory of southern origin of angiosperms in lower or mid-Mesozoic times, it is perhaps worth stressing that the present limited evidence is only negative. A fuller taxonomic account of the material is in preparation.

I am indebted to Dr. J. Hewitt, formerly director of the Albany Museum, Grahamstown, for material; to the Council for Scientific and Industrial Research, South Africa, for a grant for palynological studies; and to the Commonwealth Scientific and Industrial Research Organization, Coal Research Section, New South Wales, for assistance in nomenclature.

Cell Wall Formation in Spores of the Fungus *Allomyces*

In attempts to elucidate the details of plant cell wall formation, it is obvious that certain types of cells may be more useful than others. The investigation of cells which begin their existence devoid of a wall but which acquire one later may possibly show structural features uncomplicated by the cumulative effects of growth and differentiation. It has been shown by Nicolai[1], who investigated cell wall formation in the green alga, *Chaetomorpha*, that spores of lower plants can fulfil the special requirements for investigations of this kind. She observed that the motile reproductive cells of this alga were able to form a well-defined cell wall within 24 hr. after cessation of motility. Furthermore, changes in the form and crystallinity of the cell wall constituents

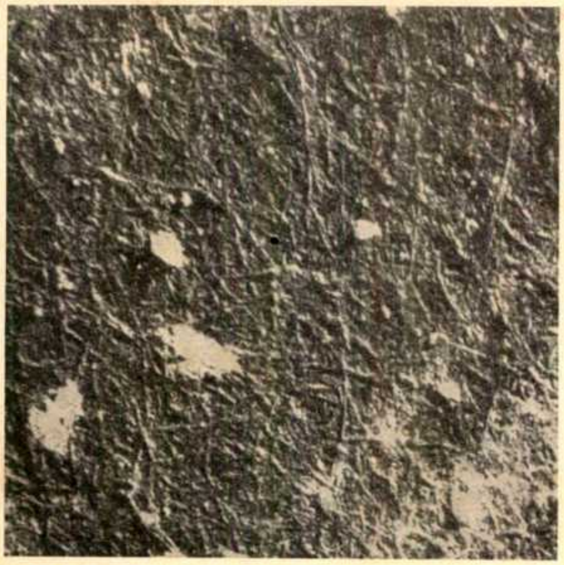

Fig. 1. Electron micrograph of a portion of the cell wall of a 24-hr. 'sporeling'. (Shadowed with platinum. × 36,000)

were detected by electron microscopy and X-ray analyses.

We thought it would be of interest to examine a similar situation in fungi. For this purpose, zoospores of *Allomyces* were used. These uniflagellate spores are considered to be without cell walls at the time of their formation and liberation from sporangia[2]. At this stage they are quite fragile and it has not been possible, thus far, to obtain preparations showing the structure of the surface of motile spores. Within 24 hr., however, observations in a light microscope show that a cell wall is present. We have made a preliminary electron microscopic study of the walls of these 24-hr. old 'sporelings'. They have been found to contain microfibrils in random arrangement, embedded in amorphous material (Fig. 1). By collecting a large number of zoospores and suspending them in a dilute nutrient medium for 24 hr., enough material was obtained for an X-ray analysis. Fig. 2 shows a comparison between X-ray powder diagrams of purified wall material from mature hyphae and partially purified material from 'sporelings'. Major reflexions attributable to chitin are present in both cases.

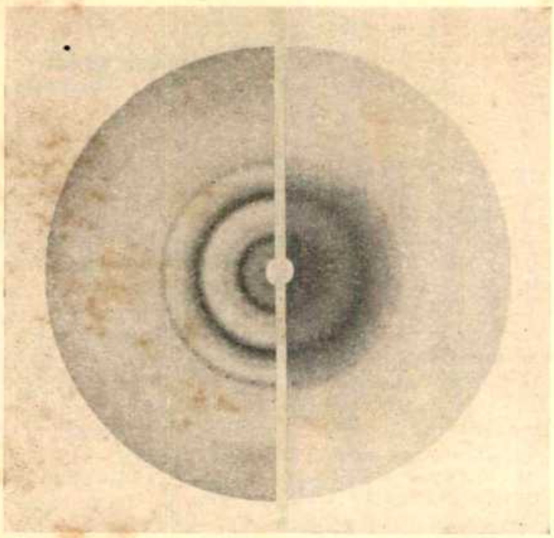

Fig. 2. X-ray powder diagrams of purified chitin from walls of mature hyphæ (left), and partially purified wall material from 'sporelings' (right)

Thus it is clear that, at a very early stage in development, the structural component of the cell wall of this fungus consists mainly of chitin microfibrils as has been found to be the case with the walls of mature hyphæ[3]. In so far as this investigation goes, it offers no evidence for an earlier suggestion that chitin is not the principal constituent of the walls during early stages of growth[4]. It seems, however, that the chitin is not as highly crystalline as that found later in mature hyphæ.

No attempt has been made to observe ontogenetic changes in wall structure from earlier stages or from the 24-hr. stage onward, and the precise time of formation of the first chitin microfibrils is unknown.

This work constitutes part of a programme supported, in part, by a postdoctoral research fellowship and supply grants awarded to one of us (J. M. A.) by the U.S. National Institutes of Health, Department of Health, Education and Welfare.

ENTOMOLOGY

Mechanisms of Resistance of the Adult Housefly (*Musca domestica*) to 'Cyclodiene' Insecticides

EXPERIMENTS have been conducted with isodrin and endrin labelled with carbon-14 in the terminal unchlorinated ring[1] and with aldrin and dieldrin labelled in the chlorinated ring (from the Radiochemical Centre, Amersham). Adult insects used were of a susceptible strain (S) and dieldrin-resistant strains (R_1) and (R_2). R_1 arose from the S-strain by exposure of the larvæ to dieldrin and R_2 from R_1 by removal of the dieldrin pressure after 19 generations[2].

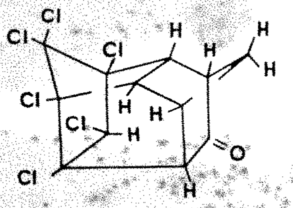
Topically applied isodrin and endrin are less toxic than aldrin and dieldrin to S-flies[3], but the converse is true for the resistant strains described. Thus, in a 10 hr. observation (female flies without food or water), 20 μgm. aldrin topically applied in acetone did not affect R_1-flies but with isodrin the $KD50$ was about 3·0 μgm. R_2-flies were less resistant to aldrin and the $KD50$ for isodrin was about 1·0 μgm. It was of interest to compare the behaviour of these compounds in the three strains.

The radioactive insecticides were applied topically in 2 μl. acetone to the dorsal thorax of adult females in groups of 10–25 while under mild *cyclo*-propane anæsthesia and kept in fresh air at 25° without food or water. The method of confinement and subsequent analytical techniques were those described previously[2].

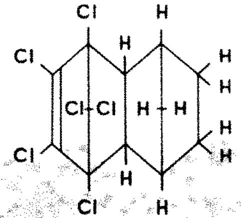
The results of experiments in which 2 μgm. of aldrin or isodrin were applied are given graphically in Fig. 1, which shows *internal* behaviour of the insecticides. *Total* recoveries were 75–85 per cent applied dose.

Penetration. A 2-μgm. dose of any of the insecticides produced severe signs of poisoning in *S*-flies in 1 hr., and at this time after application of aldrin the absorbed material (aldrin + dieldrin + acetone insoluble material in tissues) was similar for *S*- and R_2-strains, but greater in the R_1-strain. Subsequent penetration is similar in both *R*-strains but lower in *S*-flies (now knocked-down). Dieldrin penetrates into *S*- and R_2-flies at the same rate and faster than aldrin. Penetration is slower into R_1-flies, possibly due to the presence of inbred dieldrin in their tissues. The 2-μgm. dose of isodrin causes knock-down in the R_2-strain after 6–7 hr., but the penetration pattern is similar to that of aldrin; there was increased recovery of applied material in these experiments. Resistance does not appear to involve penetration differences and *R*-flies can survive with concentrations of absorbed insecticide in excess of those which would cause the death of *S*-flies.

Metabolism. All strains enzymically converted isodrin and aldrin to the corresponding epoxides endrin and dieldrin. Mixtures with the authentic epoxides could not be resolved by paper chromatography.



(I)



(II)

Acetone rinses from live insects following application of aldrin or isodrin also contained amounts of the corresponding epoxide which increased with time to about 8·0 per cent of the applied dose (50 per cent of the unabsorbed insecticide) after 8 hr. Epoxides were not formed either outside or inside heat-killed insects. This suggests that enzymic oxidation may also occur on or in the insect cuticle. Topically applied dieldrin was recovered from insects unchanged. Acetone extracts of live *S*- and *R*-insects treated with isodrin or endrin (this otherwise unchanged) contained similar small amounts of a water-insoluble product (Fig. 1*E*) which behaved as the ketone (I), a known rearrangement product of endrin[4], under the conditions of chromatography used. This ketone is virtually non-toxic when topically applied to *S*-flies. The conversion of aldrin and isodrin to their epoxides is shown in Fig. 1 (*C* and *D*).

The linear nature of these curves during the first 4 hr. when there are marked changes in the concentrations of aldrin or isodrin in the tissues suggests that oxidation is independent of precursor concentration. This might be due to rapid saturation of the oxidation site by the substrate.

The similarity between rates of production of dieldrin and endrin is interesting in view of the greater toxicity of the latter to the *R*-strains. Both aldrin and its oxidation product or isodrin and its oxidation product are present together in the tissues at the time of 'knock-down'. It is therefore difficult to decide whether either precursor or product or both are responsible for the toxic action. Perry *et al.*[5] noted the latent period between application of heptachlor to an *S*-strain and onset of symptoms which is not due to lack of penetration and cites this as an indication that death may be due to the action of the epoxide rather than to heptachlor. This is also true of aldrin. However, the reduction product (II) of aldrin, which cannot be oxidized, is still as toxic as chlordane[6], which suggests that the aldrin type of molecule has an intrinsic toxicity independent of metabolism possibilities. The results in Fig. 1 also show that resistance is not associated with a lower rate of oxidation *in vivo*.

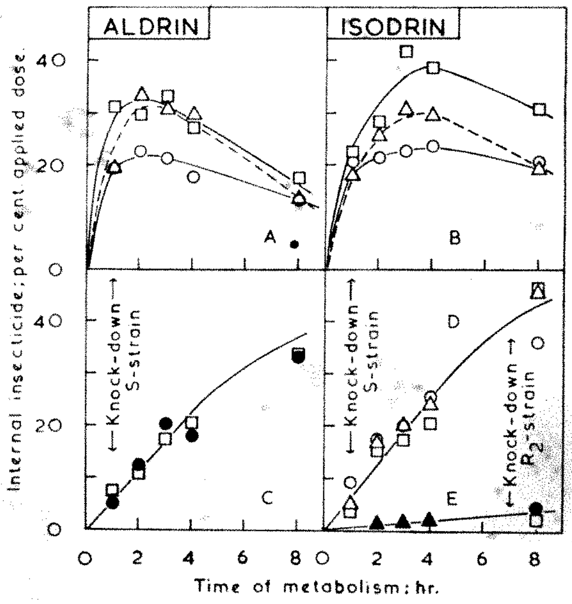


Fig. 1. Internal metabolism of ^{14}C-aldrin and ^{14}C-isodrin by adult ♀ houseflies exposed to a 2 μgm. dose. Curves: *A*, aldrin; *B*, isodrin; *C*, dieldrin production; *D*, endrin production; *E*, fast running fraction. ○—○, *S*-strain; △—△, R_2-strain; □—□, R_1-strain; ●—●, *S* and R_2; ▲–▲, all strains

Excretion. There was no reliable evidence in these experiments that radioactive material is excreted. Groups of insects with ani sealed[2], used as controls, lost as much radioactive material to the carrying papers as did the test groups, and analysis of this material revealed the same pattern. This loss by contamination may explain the appearance of epoxide in this fraction for both control and test groups after application of aldrin or isodrin, since epoxides were found on the insect cuticle.

Residual material in tissues. This fraction rose to 1–2 per cent of the applied dose (aldrin or dieldrin) for all strains at 8 hr. With isodrin and endrin there was an increase with time in all strains to the same level. This fraction was not extractable by water. The rather lower content in the R_1-strain which already contains inactive (carrier) dieldrin suggests that it may be unchanged insecticide intimately associated with the tissues.

These experiments suggest that resistance of *R*-flies to dieldrin is not due to lack of cuticular penetration, differences in metabolism, or excretion of the insecticide. Studies of the aldrin–dieldrin system and the isodrin–endrin system have not revealed marked differences between *S*- and *R*-insects within a system, or differences between the systems which would explain the differing toxicities to the resistant strains. More detailed study of these systems may, however, be useful from the mode-of-action aspect, since the observations suggest that physiological factors are involved in the resistance mechanism.

These experiments are part of an investigation into the mechanism of dieldrin resistance in diptera, supported in part by a grant from the World Health Organization.

Effect of Sub-Zero Temperatures on Diapause Eggs of *Acheta commodus* (Walk.)

IT has come to be accepted that the optimum temperature for the removal of diapause varies from one insect species to another in a way that is related to the temperatures prevailing in the climatic zone inhabited by the species concerned. Thus, Danilyevsky[1] gives a series of instances in which the colder the climatic zone of the insect the lower is the optimum temperature for removal of diapause.

The range of temperatures effective in terminating diapause is quite wide and has been shown to extend below zero for a number of species. These species are all from cold climates and for most of them a long period of exposure to sub-zero temperatures is necessary. For insects generally, it can be said that, although the range of effective temperatures may extend below zero, the optimum temperature for the removal of diapause has been found to be between 0° and 15° C. It should be pointed out, however, that so far as species from temperate climates are concerned, very few experiments on the effect of sub-zero temperatures on diapause removal have been reported.

Previous work on the diapause of the common field cricket *Acheta commodus* indicated conformity with the above principles. *Acheta* is found in the temperate and sub-tropical regions in eastern Australia and has been quoted by Lees[2] as an example of an insect from a warmer environment that requires higher temperatures for the termination of diapause. Browning[3] has reported that the range of effective temperature extends from 8 to 27° C. with an optimum at about 13° C.

In these circumstances it is of interest to report that diapause in eggs of *Acheta* can be terminated by a short period of exposure to sub-zero temperatures. In these experiments diapause was induced by holding the eggs at 23° C. for 14 days. The period of exposure necessary to terminate it decreased progressively as the temperature was lowered.

At 12·8° C. the median duration of exposure was 20–60 days, depending on the strength of diapause in the eggs being tested. At −7·2° C. the mean value over a series of tests was 5 hr., while in one test at −16·5° C. a period of only 20 min. was required. At the latter temperature a proportion of the eggs was killed before the diapause reactions had been completed.

A further notable effect is that, at any one sub-zero temperature, a progressive decline in the percentage hatching occurs if the eggs are held beyond the optimum time for the elimination of diapause at that temperature. As the period of exposure was increased the proportion of eggs resuming development decreased to nil. When given the normal incubation, that is, 15 days at 26·7° C., such eggs showed no indication of development, and, when cleared by a method previously described[4], the embryos were found to be still in the diapause stage, but were abnormal in appearance. They remained in this condition even with prolonged incubation. It is presumed, therefore, that they were incapable of development and that the treatment had been lethal.

A more detailed description of this work will be published elsewhere.

I wish to acknowledge the capable assistance of Miss J. Kenyon in carrying out the experiments.

Nervous Control of Movements in the Foregut of *Schistocerca gregaria* Forsk.

OBSERVATIONS on the nervous control of movement in the foregut of insects were first made by Marchal[1], who showed that in *Dytiscus marginalis* L. swallowing movements were abolished by the removal of the frontal ganglion. Yeager[2], in *Periplaneta fuliginosa* Serv., and Chauvin[3], in *P. americana* L., showed that the movements of the crop were independent of the intact nervous system. Further, Chauvin found that in *P. americana* L. the movements of the gizzard were dependent upon the presence of an intact nervous system; but in *Locusta migratoria* L. movements occurred in the whole isolated gut and were unaffected by agents such as acetylcholine and eserine. In general, movements of the gut are thought to be influenced by the ganglia of the visceral nervous system; but, with the exception of the work of Marchal, this does not appear to have been actually demonstrated in any insect. Arising from work still in progress upon the movements of the gut of *Schistocerca gregaria* Forsk., evidence presented in this communication was obtained of the visceral nervous control of some of the movements of the gut.

Preliminary investigations showed that a constant and repeatable pattern of gut movements could be obtained by starving the locusts for 160–170 hr. at 28° C. and 70 per cent relative humidity prior to the observation. All records refer to male adult locusts which had been pretreated in this manner. The whole gut, together with the brain, sub-œsophageal ganglion and intact visceral nervous system, was dissected out and placed in saline in a water-bath at 33° C. Several salines made to different formulæ were tried, but only that of Griffiths[4] gave satisfactory results and was used throughout these experiments. To avoid the anæsthesia which results from immersing the whole insect in saline and to prevent the preparation drying out during the dissection, the hæmocœle was irrigated with saline immediately after the first incision had been made until the completion of these preliminary stages.

Records of gut movements were made by arranging the gut so that the posterior end was fixed and the anterior end fastened by a hook to a light balsa wood lever, tensioned by a weak spring and writing on a smoked drum. The gut was immersed in Griffiths–Ringer at 33° C. through which a slow stream of air was bubbling.

In each experiment, after normal contractions had been recorded for a minimum time of 20 min., the preparation was removed from the water-bath, placed under a binocular dissecting microscope and the appropriate operation performed. During this procedure care was taken to avoid changes in temperature. The operated specimen was then returned to the water-bath and its contraction recorded for a further period of at least 20 min. This process was repeated when further operations were performed upon the same specimen, in all cases care being taken to interfere with the preparation as little as possible.

The following operations were performed, results of which are shown in the accompanying figures.

(1) The brain and sub-œsophageal ganglion were removed by cutting through the circumœsophageal connectives and freeing these ganglia from the other tissues and the visceral nervous system. In all cases this operation was without effect upon the movements of the gut (Fig. 1*a*).

(2) The hypocerebral ganglion only was removed, by cutting through the inner and outer œsophageal nerves and the recurrent nerve. This changed the normal pattern of contraction and relaxation by appreciably slowing the relaxation which followed each major contraction (Fig. 1*b*). The smaller contractions and relaxations which come between the major ones do not appear to be affected by this operation.

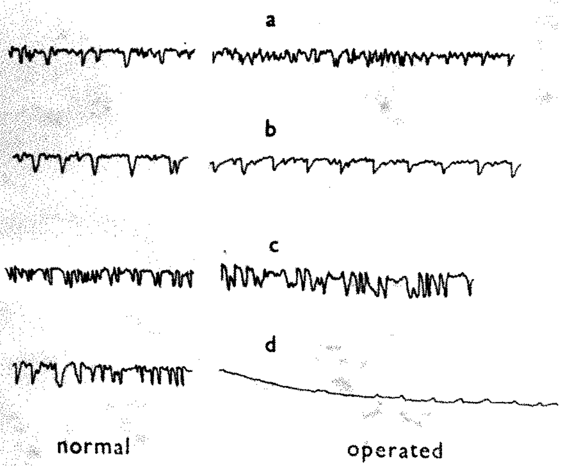

Fig. 1. Tracings of smoked drum records of gut movements of *Schistocerca gregaria*. The break in the tracing represents the moment at which the operation was performed. Time-scale shows minute intervals; the break represents a 5-min. interval. *a*, Removal of the brain and sub-œsophageal ganglion; *b*, removal of hypocerebral ganglion; *c*, severance of the outer œsophageal nerve; *d*, severance of the ventricular nerves

(3) The outer œsophageal nerves only were cut at a point approximately midway between the hypocerebral and ventricular ganglia. This operation had no effect upon the movements of the gut (Fig. 1*c*).

(4) The whole of the nervous system was intact and only the nerves arising from the ventricular ganglion and going to the gut were cut. This resulted in a complete cessation of the movements of the gut which lasted for some time, but eventually small infrequent movements appeared in the record (Fig. 1*d*).

As a result of these experiments the nervous control of gut movement may be interpreted as follows. The ventricular ganglion plays a major part in the control of gut movement and, in this respect, since movements continue normally when it is isolated from the rest of the visceral system, it is autonomous in its effects. The hypocerebral ganglion has an effect upon the movements of the gut: the negative results obtained after severing the outer œsophageal nerves show that this is not mediated through the ventricular ganglion. It presumably operates, therefore, either through the inner œsophageal nerves or through the recurrent nerve, and it influences the rate of relaxation of the gut musculature. The removal of the brain and subœsophageal ganglion was without effect upon the gut movements and therefore presumably plays no part in their control. This agrees with the observations of Chauvin[3] in *Locusta migratoria* L.

The certain identification of precisely which movements of the gut were producing which records on the smoked drum is still in progress. The movements observed here can almost certainly be attributed to the foregut, since visual observations show a corelation between these records and movements of the foregut. Further, the results of the above experiments on the visceral nervous system which innervates the foregut are in accordance with this view.

Environmental Determination of Sex in a Parthenogenetic Parasite

In the Hymenoptera, the great majority of species reproduce by arrenotoky, fertilized eggs giving rise to females and unfertilized eggs to males, but some species reproduce by thelytokous parthenogenesis, the females arising from unfertilized eggs. In thelytokous species, it is not unusual for occasional males to occur.

Ooencyrtus submetallicus (Howard) (Encyrtidae), which is such a thelytokous species, is an egg-parasite of *Nezara viridula* (L.) (Pentatomidae). The males, which have no reproductive function, usually form less than 1 per cent of the adults. Individuals occur—normally very rarely—which are basically female but possess male areas of variable extent in the anterior portion of the body. It seems likely that these individuals are gynandromorphs, that is, that they comprise genetically male and female tissues. *O. submetallicus* reproduces within a temperature range of 60–90° F. At temperatures above 85° many progeny die before reaching the adult stage.

Sex in *O. submetallicus* is dependent on temperature, and 85° is critical for sex determination. At 84° or lower, lines consist almost entirely of females; at 85°, lines cease in 2–5 generations with the sole production of males and gynandromorphs; and at 86° or higher, lines cease in the second generation similarly.

Sex is determined by the temperature to which the parent is subjected prior to deposition of the eggs concerned: it is not affected by the temperatures to which the deposited eggs are subjected. The period of parental life in which exposure to temperature determines sex of progeny includes the developmental period prior to emergence and the oviposition period after emergence. The sex of eggs deposited during the first few days of adult life is determined by the temperature to which the parent was exposed before emergence, and, as many eggs are deposited during these days, pre-emergence temperatures have an important effect on sex ratio.

The sex of the progeny laid after the first few days of adult life may be largely determined by the temperature experienced by the parent after emergence. There is a time-lag between an alteration in the temperature to which a parent is exposed and the consequent change in the sex of the progeny deposited. The rapidity of the change differs according to whether the alteration is from female-producing to male-producing temperatures, or vice versa. It appears that male-producing temperatures in the developmental period of the parent produce more profound or persistent effects on the sex of progeny than do female-producing temperatures.

The gynandromorphs arise when a parent is exposed, evidently at a critical stage of egg development, first to female-producing and then to male-producing temperatures. Variability in the degree of maleness is probably a function of the time in egg development at which this change takes place. Ability to reproduce is retained only by gynandromorphs showing slight signs of maleness.

Though males are normally rare, and gynandromorphs extremely rare, both can be produced in large numbers, or to the exclusion of females, by temperature manipulation.

The experimental data, which will be published elsewhere, appear to constitute the first proof of temperature determination of sex in any uniparental hymenopteran.

Selection for High-Order Resistance to 'Dieldrin' in *Lucilia cuprina* Wied.

HOMOZYGOUSLY DDT-resistant strains of *Musca domestica*[1] and 'Dieldrin'-resistant strains of *Anopheles gambiae*[2] have been developed in a single generation by the application of discriminating dosages which are lethal to susceptible and hybrid phenotypes in heterogeneously resistant strains of these insects. Selection experiments with chlordane on *Musca domestica* also imply that pure resistant lines follow one generation of selection with heterogeneous resistant strains[3].

Strains of *Lucilia cuprina*, free from both susceptible and hybrid phenotypes, may also be obtained with one generation of selection from partially resistant strains, providing the parent family lines contain a proportion, no matter how small, of males and females, which tolerate the high male and female discriminating dosages, established in the course of genetical experiments on the inheritance of resistance in this blowfly[4].

The selection procedure, employed during the past year, is as follows: Flies from heterogeneous strains are allowed to emerge from batches of pupæ on the first day into colony cages, after which the larger unhatched pupæ are isolated. Female flies mainly hatch from the segregated pupæ on the second day and are supplied with sugar, water and sliced liver.

When the male flies of the first day hatching are approximately 12 hr. old, the high male discriminating dose (2 μgm. of 'Dieldrin' per fly) is applied and surviving males at the conclusion of the holding period of 24 hr. are mated to the virgin female flies, which have hatched overnight. The female high discriminating dose (4 μgm. of 'Dieldrin' per fly) is applied to the female flies, 3–5 days from emergence. Male and female progeny from the selection tolerate their respective high discriminating doses, without mortality.

A further observation has been made in regard to this selection procedure with *Lucilia cuprina*. The progeny of parents, found by means of applying the high discriminating doses, tolerate significantly larger amounts of 'Dieldrin' than the parents. Is this merely vigour tolerance? For example, a strain in which considerable reversion towards susceptibility had occurred by the tenth generation contained no male or female flies able to tolerate 10 μgm. of 'Dieldrin' per fly. Five female and three male flies from this reverted strain survived their respective high discriminating doses. The male and female progeny from the parents not only tolerated the high discriminating dosages of 2 and 4 μgm. of 'Dieldrin' per fly, respectively, with complete survival, but, in addition, female flies were able to withstand 10 μgm. of 'Dieldrin' per fly, again with nil mortality. Inconsistent survival occurs with male flies at this dosage-level following a single generation selection, but 50–75 per cent survival often results with male flies.

A full account of both observations in connexion with the development of high-order resistance to 'Dieldrin' in *Lucilia cuprina* will be published elsewhere in conjunction with reversion data on selected strains. In regard to reversion of resistant strains, initial experiments have shown that during the process of reversion towards susceptibility the lower limit of tolerance to 'Dieldrin' of successive generations of a strain, developed by means of one-generation selection, progressively approaches the high discriminating dose-levels. Once hybrid flies appear, usually by the sixth generation, susceptible flies are diagnosable in subsequent generations.

BACTERIOLOGY

Enhancement of Staphylococcal Virulence for Mice by Intraperitoneal Cortisone Acetate, Cholesterol and Lecithin

THE intraperitoneal administration of bile salts and of certain surfactants, followed by an ordinarily non-lethal inoculum of micro-organisms belonging to a number of different species, results in marked enhancement of the virulence of the latter for mice as manifested by a high incidence of fatal bacteræmia in these animals[1]. A similar capability of enhancement of virulence on the part of intraperitoneally administered cortisone acetate, cholesterol or lecithin with *Staphylococcus aureus* is reported in this communication.

Cortisone acetate suspension (Merck), 50 mgm./ml., as well as its vehicle, a saline solution containing suspending agents and 0·9 per cent benzyl alcohol, were obtained from commercial sources. Cholesterol (Fisher), 2·5 per cent, was prepared by suspending the amount indicated in distilled water, autoclaving at 15 lb. for 15 min., homogenizing in sterilized conditions in a Waring blendor to break up particles, after which the suspension, because of its settling tendency, was vigorously shaken immediately prior to each injection. Lecithin (Pfanstiehl), 2·5 per cent, was wet ground with a small amount of distilled water, brought to final volume with the same diluent and autoclaved. 5 per cent gastric mucin (Type 1701, Wilson) was prepared according to Miller[2]. *Staphylococcus aureus* strains were coagulase positive, hæmolytic and fermented mannitol. The above adjuvants were injected intraperitoneally in the amount indicated followed by 0·25 ml. of an 18-hr. culture of the staphylococci in trypticase soy broth at 37° C. into groups of 10 albino male Swiss mice weighing 15–20 gm. Deaths occurring within 48 hr. were noted. Post-mortem heart-blood cultures were streaked promptly upon expiration if death occurred during the day, and early morning if the animals died during the night, upon plates containing 1 part homogenized milk and 2 parts trypticase soy agar, which greatly favours pigment production by staphylococci, and positive results were tabulated.

The number of fatal bacteræmias produced within 48 hr. by the three test staphylococcal strains with 25 mgm. of each adjuvant under test and with 0·5 ml. of gastric mucin 5 per cent, for comparison, is noted in Table 1. Adjuvants by themselves all failed to evoke any mortality in preliminary toxicity tests. More than 90 per cent of the mice that died succumbed within 24 hr. As may be observed from Table 1, a high incidence of fatalities with septicæmia was achieved with the aid of each adjuvant under consideration whereas a similar intraperitoneal injection of staphylococci without their use proved innocuous. The effect of cortisone acetate suspension cannot be attributed to its suspending agent since the latter, alone, failed to elicit any mortality.

Table 1. MOUSE MORTALITY/10 AND POSITIVE POST-MORTEM HEART-BLOOD CULTURES ELICITED BY VARIOUS INTRAPERITONEAL ADJUVANTS WITH *Staphylococcus aureus* TEST STRAINS

Adjuvant	Dose (ml.)	*S. aureus* strain *A*	*S. aureus* strain *B*	*S. aureus* strain *C*

Table 2. DAILY MOUSE MORTALITY ELICITED WITH INTRAMUSCULAR CORTISONE ACETATE FOLLOWED BY *Staphylococcus aureus* STRAIN *A* OR PHYSIOLOGICAL SALINE, INTRAPERITONEALLY

Intramuscular cortisone acetate (mgm.)	Intraperitoneal injection (0·25 ml.)	Time of intraperitoneal injection	Mortality* Day 1	2	3	4	5	6	7	8	9
25	Physiological saline	Stat	0	0	0	1	3	0	0	1	0
25	*S. aureus* strain *A*	Stat	0	0	0	0	1	3	2	3	0
25	*S. aureus* strain *A*	24-hr post-intramuscular cortisone	0	0	0	0	1	3	0	3	0
5 – 3 × daily for 2 days	Physiological saline	Following final intramuscular cortisone	0	0	1	0	3	1	0	2	0
5 – 3 × daily for 2 days	*S. aureus* strain *A*	Following final intramuscular cortisone	0	0	2	0	2	3	0	1	0

* 10 mice in each group.

Cortisone is known to exert a profound systemic action wherein the resistance of laboratory animals is depressed to a wide variety of bacterial, viral, protozoal and fungal agents. It was of interest to ascertain whether or not the enhancement observed above might not be attributable to this generalized effect. The corticosteroid was therefore administered extraperitoneally via the intramuscular route in equivalent doses at varying periods prior to the intraperitoneal injection of bacteria or of physiological saline, both in one single dose and in a 2-day course of 3 injections daily. When the preparatory cortisone injection was administered by the extraperitoneal route no deaths occurred within 48 hr. after the intraperitoneal injection of the micro-organisms (Table 2). Those deaths that did occur came later and were the result of the toxic effect of large doses of cortisone, possibly by activation of latent intrinsic infections, since the number of deaths and the times of their occurrence were essentially the same regardless of whether bacteria had been injected. It is therefore concluded that enhancement of staphylococcal virulence for mice by intraperitoneally administered cortisone acetate is by virtue of its local rather than general effect.

No common property or factor is evident between gastric mucin, the most thoroughly investigated of the infection promotion substances reviewed by Olitzki[3,4] and those at present and previously[1] reported upon by us that might account for their virulence-enhancing capability with the possible exception of their common ability to lower surface tension significantly. The exact mechanism whereby mucin exerts its effect has not been completely established. Although it may exert a growth stimulatory effect under certain conditions[5,6], weight of evidence would seem to indicate that its action is directed primarily against the host's defence mechanism by interference with phagocytosis, intraphagocytic digestion and the bactericidal action of peritoneal fluid upon the bacteria because of their coating. Surfactants, by virtue of their surface depressive action, may similarly protect intraperitoneally injected micro-organisms from the defence reaction of the host. Cortisone acetate, cholesterol and lecithin as well as gastric mucin in the concentrations employed are all capable of lowering surface tension, their surface tensions measuring 40·0, 37·3, 42·2 and 43·3 dynes/cm. respectively with the Fisher surface tensiometer at 25° as compared to 75·7 for physiological saline. Capability of lowering surface tension *per se* may not, however, be the only determinant since 'Tween 80', even though it lowers surface tension considerably, is incapable of enhancing bacterial virulence for mice[1].

Other factors of possible contributory significance are chemical composition, viscosity and physical state. The effective adjuvants are of varied chemical composition. Gastric mucin is a mucopolysaccharide or glucoprotein. Surfactants are chemically diverse; the anionic detergents include sulphated alcohols, paraffin, alkylaryl and petroleum sulphonates, whereas non-ionic detergents consist of polyesters and ethers formed as condensation products from fatty acids, alcohols and phenols. Lecithin, on the other hand, is a mixture of the diglycerides of stearic, palmitic and oleic acids linked to the choline ester of phosphoric acid. Bile salts, cortisone acetate and cholesterol are all steroids characterized by the *cyclo*pentenoperhydrophenanthrene nucleus. As for viscosity, only gastric mucin of the above is significantly viscous, its relative viscosity being 2·5, as compared to the others, the relative viscosities of which measure approximately 1·0, as computed by determining efflux time from a calibrated tube of uniform bore at constant temperature. Considering physical state, while the subject adjuvants of this report and gastric mucin are suspensions containing particulate matter, bile salts mixture and the surfactants previously found effective form clear solutions. Further studies are in progress in an attempt to elucidate the mechanism whereby these chemically and physically diverse substances convert ordinarily non-lethal intraperitoneal infections in mice into rapidly fatal ones.

This investigation was supported in part by Research Grant No. *E*-2687 of the U.S. Public Health Service, National Institutes of Health.

Isolation of a Phagocytosis-inhibiting Substance from Culture Filtrates of an Encapsulated *Staphylococcus aureus*

COAGULASE-negative strains of *Staphylococcus albus* added to suspensions of rabbit polymorphonuclear leucocytes in normal rabbit serum are rapidly phagocytosed and destroyed; in contrast, coagulase-positive strains of *Staphylococcus aureus* resist ingestion and survive extra-cellularly. The addition of anti-serum prepared against heat-killed *S. aureus* results in efficient phagocytosis and intracellular killing of the homologous organism[1]. The present communication describes the isolation and properties of a substance obtained from culture filtrates of a encapsulated *S. aureus* which interferes with it phagocytosis.

The organism utilized was *S. aureus* 'Smith' (phag type 44*A*/42*E*, hæmolytic, coagulase-positive, and mouse virulent). Bacterial cells were removed b centrifugation and filtration from 15 l. of an 18-hr culture grown in the medium and apparatus describe by Goebel *et al.*[2]. The supernatant fluid was concentrated *in vacuo* and lyophilized after dialysis against distilled water. Absolute ethanol was added to 1 per cent solution of the material in aqueous sodium acetate. A fraction was isolated which was solubl in six but insoluble in eight volumes of ethanol. This fraction was deproteinized by repeatedly extractin a 0·5 per cent solution in 0·02 *M* acetate buffer *p*H 5·0, with chloroform–octanol. The lower phas was then dialysed against distilled water and lyophilized.

1 gm. of white amorphous material was obtained which had the following physical and chemical properties. A 0·5 per cent solution in isotonic saline sedimented as a single peak when examined in the analytical ultracentrifuge; $S_{20} = 1{\cdot}3$ Svedberg units. An essentially homogeneous boundary appeared upon free electrophoresis of a 1·0 pe cent solution in veronal buffer, *p*H 8·6, ionic strength 0·1; the mobility was $-11{\cdot}4 \times 10^{-}$ cm.²/volt-sec. The nitrogen and phosphorus contents were 7·4 and 0·18 per cent, respectively Marked humin production was noted upon heating in dilute mineral acid. Analysis of hydrolysed sample revealed the presence of the following components amino-acids—28·9 per cent (alanine—9·1 per cent glutamic acid—6·7 per cent, lysine—6·6 per cent aspartic acid—4·8 per cent, glycine—1·1 per cent threonine—0·25 per cent and serine—0·25 per cent) lipid—0·0 per cent; reducing sugar—15 per cent and hexosamine—12·4 per cent. The remainder of the carbohydrate moiety apparently consisted of one or more non-reducing sugars as yet unidentified Neither muramic acid nor sialic acid was demonstrated.

The isolated substance reacted promptly in capillary precipitin tests, with rabbit anti-sera prepared against homologous, heat-killed organisms, but were not precipitated with normal rabbit serum. The end point occurred at a final concentration of less than 0·5 μgm./ml. At a concentration of 1 mgm./ml. a single band was formed with immune rabbit serum in double diffusion precipitin tests in agar gel. Pooled human globulin (16·5 per cent γ-globulin) also formed a single band in this reaction. Several attempts to stimulate formation of antibodies by injecting the compound into experimental animals have thus far been unsuccessful.

When immune rabbit serum against *S. aureus* 'Smith' was absorbed with the material at the equivalence point, the serum no longer agglutinated the bacterial cells. The opsonizing capacity of the absorbed serum was then compared with that of unabsorbed immune serum. Rabbit polymorphonuclear leucocytes free from erythrocytes and other leucocytes were obtained from glycogen-induced peritoneal exudates. Previously described suspending media and conditions for performing the phagocytic tests were employed[1]. Each suspension contained 10 per cent fresh normal rabbit serum to provide adequate amounts of complement.

Results from a representative experiment are presented in Fig. 1. Addition of absorbed anti-serum

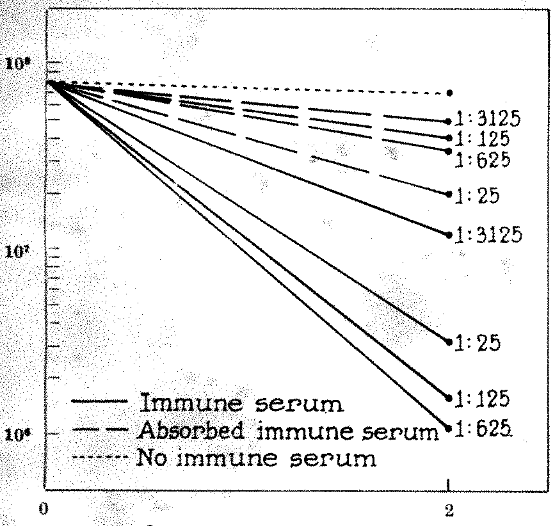

Fig. 1. The fate of *S. aureus* Smith in suspensions of rabbit polymorphonuclear leucocytes

d little effect upon bacterial survival, whereas a arked reduction in the number of viable units curred upon addition of even small quantities of absorbed immune serum. Enumeration of viable cteria in the supernatant fluid following deposition the phagocytes by low-speed centrifugation vealed that all the viable staphylococci were e in the extracellular fluid. This observation tablished that the effects noted were dependent on differences in phagocytosis and not a reflexion intra-leucocytic survival. It was furthermore own that agglutination of bacteria did not play a gnificant part in the phagocytosis assay and that e substance itself was not inherently leucotoxic.

Thus, absorption of immune serum with the purified mpound isolated from the staphylococcal culture trate resulted in a loss of both agglutinating and sonizing properties against the homologous organm. The biological properties and method of isolation ggest that the material is located on the bacterial rface and is perhaps of capsular nature. Experiments e in progress to determine the complete chemical mposition of this substance, its occurrence in other rains of *S. aureus*, and its role in the pathogenesis staphylococcal infection.

I wish to express my gratitude to Drs. Walther F. oebel, Margeris A. Jesaitis and Zanvil A. Cohn for eir aid and advice.

MISCELLANY

Arrow Symbol in Biology

THE great value of this symbol in representing hemical reactions has tempted biologists to extend s use, in diagrams and 'schemes', to represent other ctivities. This in principle is far from objectionable : iagrams and schemes are very helpful and this ymbol is a clear, meaningful piece of shorthand, but unfortunately so many different activities have come to be represented by it that it has more than lost in specificity what it has gained in comprehensiveness.

The representation $A \rightarrow B$ has been used with the following meanings, among others : (1) molecule A is converted to molecule B ; (2) entity A produces, gives or donates entity B ; (3) entity A is converted (in various senses) into entity B ; (4) A induces the formation of B ; (5) A stimulates or acts on B ; (6) entity A causes an activity B ; (7) A moves to place B, and even (8) I wish you to transfer your attention from item A to item B. When many of these occur in a single scheme or diagram the result may be as difficult to read as a long-hand text and far less precise and explicit. It can be at least confusing and at the worst grossly misleading : "holding issues even that are nothing mated", all the more insidious because readers are less critical of diagrams and may only half-recognize their own misapprehension. Indiscriminate lumping of issues that are not mated is contrary to good scientific practice and inimical to its best interests.

Ideally the symbol should undergo 'adaptive radiation' so as to convey the specificity of each significant type of activity for which it becomes indispensable. In fact, at present the irreducible number of such types probably is small enough to permit a reasonable and useful differentiation of this kind. To be reasonable and useful the variants of the symbol should readily convey their respective meanings and they should be easy both to write and to print. Also as far as possible they should evolve naturally and spontaneously, and command the general approval of usage. A minimum of suggestions therefore should be made at this juncture.

(1) The type of representation $A \rightarrow B$ naturally will continue to be used for chemical reactions, with the usual further conventions for reversible reactions ; it is accepted to mean 'A produces B', and there seems no objection to extending it to entities other than molecules, provided that the action is producing, donating, giving, etc.

(2) Where complete systems of chemical reactions are to be represented, and particularly the cyclic systems so common in biology, the formulation of Baldwin[1] is admirable and has already the sanction of general usage. The simple scheme 
, for example, indicates that molecules A and C interact to give B and D ; D then interacts with E to give F and to restore C, which continues to react cyclically. This also has potential application to other entities.

(3) The symbol $A \Rightarrow B$, incorporating the 'equals' sign, conveniently could express a direct and total conversion or transformation of A into B. Chemists well might prefer it to the simple arrow to distinguish isomeric changes from orthodox reactions, but it is for the biologist that the distinction is particularly important. The symbol would represent ontogenetic, phylogenetic, seasonal and other transformations of any entity. The transformations are often complex by chemical standards, with much renewal of material by metabolic turnover, but in biological conceptions a persisting identity of the entity is often the main emphasis.

(4) The symbolism $A \dashrightarrow B$ usefully could represent A moves to B, the dashes pictorially representing the actual steps. It could cover affine conceptions: A is donated to B, etc., wherever movement is implied.

(5) The type of activity: A acts upon B, where A and B are entities other than molecules and not necessarily entities of the same kind, as when a hormone acts on an organ, conveniently could be represented by $A \nearrow\!\searrow\!\bullet B$, which pictorially puts A into the correct relationship. The existing use of this and other symbols in specialist branches of chemistry is not likely to cause serious confusion.

There remain a number of possible simple variants of the symbol for other distinct activities. All could be double-headed when required to represent reciprocal interactions and reversible processes. The present practice of writing the names of promoters of an activity over the shaft of an arrow should be extended and similarly the names of inhibitors, associated with short intercepts across the shaft. A convention that promotors are placed above a horizontal, and to the right of a vertical, arrow, and inhibitors on the opposite side, also seems reasonable. With advantage, authors might accept the conventions of Occam's axe in introducing new symbols; an apparently new relationship will often be covered by existing symbols or a combination of them, for example, $A \rightarrow B \dashrightarrow C$: '$A$ produces B and donates it to C'. Another convention which seems reasonable is that A, B, etc., must be entities and not activities, which are always represented by arrows. Thus the representation (6) above, namely, 'A causes an activity B', which might be the conversion of C to D, should be written $C \overset{A}{\Rightarrow} D$.

A Simple Method for obtaining Perforated Supporting Membranes for Electron Microscopy

SUPPORTING membranes with holes are usually used for testing the axial astigmatism of the objective lens in electron microscopy. In the case of specimens which are difficult to focus they facilitate the focusing. Supporting membranes with a large percentage of open area are of great advantage for mounting thin sections, because the gain in contrast is considerable[1]. It applies also to specimens for testing the resolving power of the electron microscope or high-resolution work, when a very thin film of collodion can be mounted on these perforated membranes[2]. The holes will then enable not only the focusing but also a continuous control of the axial astigmatism. Several methods for obtaining holes in supporting membranes have been described[3-5]. Mostly 'Formvar' film is used; but to obtain reproducible results the methods are relatively complicated.

We have developed a simple method for obtaining holes in collodion films. This method does not differ from the others in principle, as it is based on the introduction of minute water droplets into the film; but it does not require any special equipment ar makes it possible to prepare the membranes or ne very quickly and in a reproducible way.

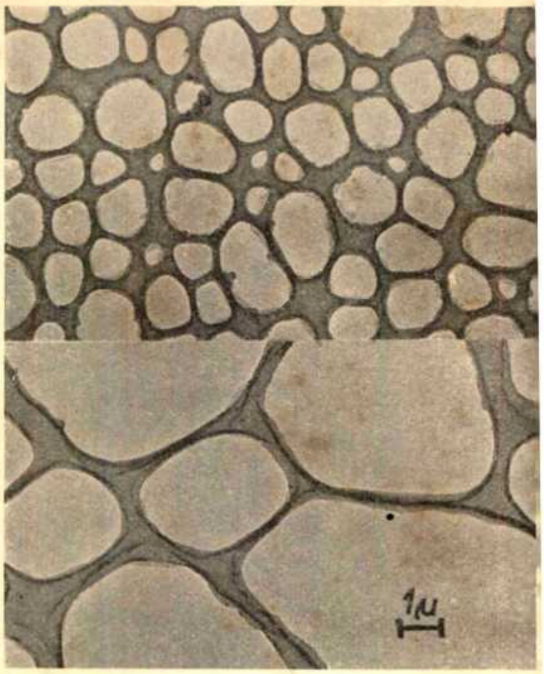

Fig. 1

A solution of 0·2–0·3 per cent collodion solutio with *iso*amyl-acetate as solvent filling up about half of a small glass vessel is used. A thorough mechanically cleaned microscope slide is dipped int the solution and held for about 30 sec. in a vertic position above the solution surface. Then the slide removed from the vessel and breathed upon aft some few seconds. Breathing upon the film on t slide may be repeated several times at intervals of few seconds as long as the solution is evaporatin The forming of the film area with holes can be easil followed by observing the film, because this area h a 'foggy' appearance. According to the length an intensity of the breathing a narrower or broad strip of film with holes is formed. The film from th slide is easily floated off on to a water surface an the areas with holes are transferred to specimen grid Before using, the film with holes is stabilized b evaporation of carbon or metal.

The size of the holes depends on the width of th 'foggy' strip. For most purposes a width of abou 1·5 mm. is suitable. In a narrower strip small hole arise; in broader ones a net is formed. If the are with holes is too broad the net is likely to shrin when being floated off. Electron micrographs of hole obtained in this way are shown in Fig. 1.

SCIENCE COLLEGE,
92, Upper Circular Road,
CALCUTTA.

A STAFF COLLEGE FOR TECHNICAL TEACHERS

It is fitting that, in what is likely to be his last public pronouncement as chairman of Britain's largest limited liability company, Sir Alexander Fleck should be identified with an appeal to set up a staff college for technical teachers. It was in the evening classes of a technical college that, many years ago, Fleck began a career as a student chemist which was later to take him to fellowship of the Royal Society and the chief executive's position in Imperial Chemical Industries, Ltd.

The idea of a staff college for teachers in technical institutions in Britain was first mooted by the Education Committee of the Federation of British Industries in 1956. It had grown out of the experience of members of the Committee who belonged to large industrial undertakings and whose companies had found it advantageous to establish a centre where they could send senior staff for a short intensive course designed to enlarge their personal qualities and ability. The idea was taken up afterwards by the Special Committee on the Supply and Training of Teachers for Technical Colleges appointed by the Minister of Education, of which Sir Willis Jackson was chairman, and it was discussed in the Committee's report*. This recommendation was widely supported by many authorities, including the Minister of Education's own Advisory Councils on Education for Industry and Commerce, and for the Training and Supply of Teachers. The latter Council, at the Minister's request, made a more detailed study of the proposal through a new sub-committee, of which Sir Willis Jackson was again chairman.

The place of the staff college as a means of developing quality in advanced technical education has been well put in a memorandum prepared by this sub-committee (not published). At the top level of the technical teaching profession there is a need for men with the breadth of outlook, attitude of mind and authority required to stimulate up-to-date teaching and research work of high standard, to talk with conviction to executives of industry and to exert an influence on thought and action outside as well as inside the colleges. Existing facilities for teacher training, or for keeping teachers in touch with new developments by means of short courses, do not provide the right kind of experience for senior staff; and the normal contacts which a teacher makes with local industry through advisory committees, and the day-to-day operation of technical courses, do not bring him into close enough contact with a sufficiently wide range of industry.

To fill the gap, a national centre is needed where carefully selected senior staff from the colleges can exchange information, ideas and experience, by direct contact and personal discussion, with each other and with personnel from industry, the universities and associated fields. Experience with staff colleges organized by industry has already shown that this function can be discharged most effectively within small groups working in close personal association.

It is not only senior teachers in technical colleges who would benefit from the establishment of the proposed staff college. Industry would benefit indirectly through the improved quality of technical education which should result, but could also benefit directly through participation in courses by those responsible for training schemes in industry or for co-operation with technical colleges on research projects.

The staff college envisaged by the Willis Jackson sub-committee would be a small establishment providing a series of short courses throughout the year under the general supervision of a permanent director of studies. The courses would be limited to about twenty teachers, together with about half that number of individuals drawn from industry and commerce. As there are about 17,000 full-time teachers in technical colleges in Britain, those selected to attend would probably belong to the 3,300 or so among that number who are of the grade of senior lecturer or higher. Probably not more than about 200 teachers a year would pass through the college.

What could such a college achieve ? Its main object would be to ensure an adequate supply of key personnel for the technical colleges—the future principals, heads of departments and other key staff. Ultimately, success of the Government's policy for expanding facilities in technical colleges, for which the sum so far authorized is about £150 millions, will depend upon these men. Already well-versed in some particular branch of technology, good teachers, and experienced administrators, they would be given the opportunity of discovering in themselves further qualities of leadership and authority.

Such a college would not strictly be regarded as a teaching institution. The composition of a group would vary according to the subject of the course. There would be no 'instruction' in the ordinary sense. The participants would jointly study some main problem or topic in the field of technology, with particular reference to its significance for teaching and administration in the technical colleges. The members of a group would be their own teachers in a co-operative study to which each individual would make a reponsible contribution. For this reason, the number of the directing staff would be kept as low as possible, but they would have to be of very high quality.

---

* Ministry of Education. The Supply and Training of Teachers for Technical Colleges: Report of a Special Committee appointed by the Minister of Education in September 1956. Pp. xiv+68. (London: H.M. Stationery Office, 1957.) 4s. net.

A remarkable and highly commendable feature of the way in which the proposal for a staff college has developed is that it can truly be called a co-operative venture between industry and education. The idea originally came from industrial representatives; it was taken up and developed by a committee set up by the Ministry of Education. An approach by industry was therefore made to the Ministry about the way such a college could be financed. The Ministry of Education consulted local education authorities, and the scheme put forward by Sir Alexander Fleck can now command the support of industry, central and local government.

To establish such a college an initial sum of £100,000 will be required. The annual running cost would be about £30,000. Exchanges between Sir Alexander Fleck and the Minister of Education have revealed that, if industry would find the original £100,000, the running costs would largely be met from public funds. To keep fees for courses down to a reasonable figure, the Ministry itself is prepared to pay an annual grant of up to £10,000 to the college. This subvention, amounting to about one-third of the running cost, should enable the college to offer its facilities for a fee of about £75 for a three-week course. For the most part these fees will be paid by local education authorities as the employers of the teachers attending the course. The remainder would come from fees paid by the employers of other participants, including industrial and commercial firms.

In private approaches to some thirty firms, Sir Alexander has already been promised £60,000 of the capital cost. He, and the industrial sponsors, have shown their wisdom by making a public appeal to any firms which care to participate. If all the money had been collected from a comparatively few large firms, the college would have got off to a bad start. From the beginning it should be regarded as one in which all industrial organizations in Britain have had the opportunity to participate; it is to be hoped that many small firms will contribute.

It is not only in finance that the proposed college can be regarded as a joint enterprise between education and industry. Sir David Eccles has discussed the proposals in general with the associations of local authorities and agreed that, on the governing body, there should be equal representation of local authorities, technical teachers and industry and commerce, together with a university representative. What is even more noteworthy is that the Minister has already asked Sir Alexander to accept the chairmanship of this non-existent governing body and that Sir Alexander has accepted.

Apart from the intrinsic merits of the proposal to set up this staff college, a number of features commend themselves. First, it is an excellent example of the way in which industry and education should come together to promote the development of technological education. Secondly, it shows that a Government department can act quickly when the right approach is made to it by industry. Thirdly, the small group of men, who first put forward the idea some four to five years ago and met a stone wall, hard and apparently unclimbable, may now rejoice that the first courses in the new college should take place before the end of 1961. There is little doubt that such a college will be the centre of much interest, not least among those responsible for the administration of universities.

ROCKET PROPULSION

Rocket Propulsion

By Marcel Barrère, Prof. André Jaumotte, Prof. Baudouin Fraeijs de Veubeke and Jean Vandenkerckhove. Pp. xxxi+829. (Amsterdam: Elsevier Publishing Company; London: D. Van Nostrand Company, Ltd., 1960.) 135*s*.

A GOOD book on rocket propulsion has long been awaited, and I received this one with hope. I regret to say that my hopes have not been realized, and this is all the more disappointing because of the standing of the four authors. It would have been enlightening to know the type of reader whom the authors had in mind when compiling this book. It is not satisfactory as a text-book for students, who require instruction in basic principles and only sufficient technology to show how principles are applied, nor is it satisfactory for people actually engaged in rocket design and development. In this latter respect it is perhaps doubtful whether a good book on rocket technology can yet be written because the predominantly military application of rockets brings in its train security difficulties. The net result is that the 'technology' which can be revealed is either obsolete, or even misleading, and in this context it must be realized that something done two years ago may be obsolete.

Reverting to the possibility of regarding this book as a basic work for students, it fails in many respects, and the text contains much irrelevant matter which I found distracting, nay confusing.

Chapter 1, "Rocket Propulsion Elements", scarcely lives up to its name. "Specific Impulse", that all-important criterion of rocket performance, receives brief initial mention on p. 33, surrounded by trivia on "Useful Power" and "Propulsive Efficiency". Surely the latter part of this chapter headed "Nuclear Energy" is nothing but misplaced padding, but a more serious criticism relates to the section of this chapter headed "Conclusion". A completely unjustifiable assumption relating a portion of the rocket weight to specific impulse is made on p. 52, leading, as one might expect, to a completely erroneous conclusion regarding optimum specific impulse: a sad beginning to more disappointments.

Chapter 2 has the title "Nozzle Theory and Characteristic Parameters". Perhaps we can forgive the misuse of the word 'parameter', which occurs frequently throughout the book, but this chapter occupies 71 pages, yet the authors state in their second paragraph, "Whilst refraining from going into detailed theory of nozzles, we shall summarize the principal relationships needed for our purpose". Certainly they refrain from devoting just one page to derive the expression:

$$\frac{dA}{A} + \frac{dv}{v}\left[1 - \frac{v^2}{a^2}\right] = 0$$

where A is the cross-sectional area of the nozzle; v is the corresponding velocity of the gases in the nozzle; a is the local velocity of sound, from which the convergent–divergent nozzle 'emerges'. Its introduction might have saved the authors twenty pages of print and given the reader a true appreciation of the Laval nozzle.

So the text goes on for a total of 811 pages with much that is of little positive value. Very few of the basic conclusions are derived, and on many occasions important statements are made for which one would rightly expect some proof. But, no. Surely one is justified in expecting a short proof that if n is the index of the burning pressure, governing the burning-rate of solid propellents, equilibrium can be established only if n is less than unity. Incidentally, on p. 240 one reads that if n is greater than unity an explosion will occur. In fact, if n is equal to unity an explosion will occur—a slight but most important difference. Erosive burning is referred to on pp. 201 and 202 and again on pp. 259 and 260, and the two references show little connexion with each other. Why could not the authors deal with it once, and once only?

Many examples of wrong statements may be quoted and one or two will be sufficient to indicate the worries created in my mind. On p. 317 we find "The nozzle weight is found to be approximately proportional to total impulse". This is just not true, and there is no reason why it should be. Yet again, in section 7.2.5, "Geometry of the Combustion Chamber", one reads that there are 'trends' in combustion chamber shape and infers that they are subjected to the same whims of fashion as ladies' waists and hem-lines. If this were true, why did the authors devote 100 pages and more in Chapter 7 to the problems of liquid-propellent rocket combustion chambers and another 60 pages in chapter 10 to combustion instability? Yet, throughout, the authors make implicit assumptions on chamber shape. On p. 468 we read that "the Mach number in the chamber is low, being of the order of 0·1, we can neglect its influence". Thus, whether the authors realized it or not, they are implying that the ratio:

$$\frac{\text{combustion chamber cross-sectional area}}{\text{nozzle throat area}}$$

is greater than 5 : 1. To say the least, this is at variance with earlier remarks on 'trends'.

Occasionally we get glimpses of the true position in rocket research and development as in paragraph 10.4 on p. 707. "A change in the scale can completely alter the stability conditions of the power plant, and it is difficult to predict the operating stability of a large rocket on the basis of experimental results obtained on small-scale models." I certainly accept this as true and regard it as an incentive to do some basic work to rectify the position. The book takes 50 pages to say the same thing.

To anyone diligent enough to pursue some of the numerous references given at the end of each chapter there is a more enlightened story awaiting them. It is noteworthy that most of these references refer to American documents, and the authors can scarcely be blamed for the paucity of references to British work.

After 'scanning' this book, I am a sadder, but no wiser, man.

J. E. P. Dunning

NEUTRON PHYSICS

Introduction to Neutron Physics

By L. F. Curtiss. (Van Nostrand Nuclear Science Series.) Pp. xi+380. (Princeton, N.J.: D. Van Nostrand Company, Inc.; London: D. Van Nostrand Company, Ltd., 1959.) 73*s*.

There is now an extensive literature on neutron interactions and on the techniques used in their study. A student starting work in this field is frequently confused by the proliferation of original papers, and needs a text-book which will give him a grounding in this subject of neutron physics. It is the aim of Dr. Curtiss's book to do just this; and on the whole it succeeds.

The emphasis of the book is on experimentally demonstrated facts and widely used techniques. The level of presentation is fairly elementary, but the book is easy to read and the style is clear and flowing. A student should have no difficulty in mastering the text and doing the problems which are found at the ends of the chapters. There is a lot of simple details which will help to give the student a 'feel' for this subject, but there is little critical discussion which would lead the student into the more complex parts of neutron physics.

In writing a book of this type it is often difficult to keep it up to date. This review will appear some eighteen months after the author wrote his preface, but from an examination of the text and the references it seems that the literature is covered up to 1956 only, so that the book is effectively four years old already. Of course all authors and publishers are familiar with this problem, and to counteract it some type of general bibliography covering the last few years might well have been included during the final preparation. In spite of this defect, this book covers all the groundwork of its subject.

Although most branches of neutron physics receive attention, there are occasional lapses. For example, the linear electron accelerator is not mentioned in the discussion of pulsed neutron sources; and inelastic scattering of thermal neutrons is entirely omitted. In discussing thermal neutron interactions Dr. Curtiss uses the term 'diffuse' cross-section in place of the now almost universally used term 'incoherent' cross-section, which may confuse some of his readers.

Nevertheless this book will command a wide audience and will be found both necessary and useful in many laboratories. The presentation is good, the diagrams are clear and there are very few misprints. The author and the publishers are to be congratulated on the result of their labours.

P. A. Egelstaff

INSECT PHOTOGRAPHY

Les Plus Beaux Insectes

Textes de A. Villiers. (Collection "Nature et Beauté".) Pp. 96 (154 illustrations). (Paris: Larousse, 1958.) n.p.

This quarto volume is one of the Larousse series "Nature et Beauté", and is primarily an atlas of more than one hundred and fifty photographs of insects. These are from a variety of sources, some showing insects in natural, or quasi-natural settings, others from pinned and set specimens, formally arranged into a plate. Twenty-four full-page plates are in colour, printed on an art paper with a lustre surface which is pleasant to the touch, and which displays the colours well, without any troublesome reflexions.

The reproduction of colours is good for the browns and yellows. The Orthoptera in Figs. 31*a*, 31*b* and the Hymenoptera in Figs. 63*a*, 63*b* are full of life, as well as structural detail. The reds are much less strident than in some French colour-plates of insects. Least successful colours are the pastel blues and greens, so that *Agrion splendens* belies its name in Fig. 7, and the long-horned grasshopper in Fig. 26 has a ghostly appearance. Definition and reproduction of detail are excellent in nearly all plates, black-and-white as well as colour.

The captions usually give the natural size of the insect, but it is to be regretted that quite a number of them wrongly identify the insects shown. Sometimes the whole caption is inappropriate, as if another photograph had been substituted for the original. Figs. 44*a*, *b*, *c* have clearly been re-arranged for artistic effect, leaving each of them with the wrong caption. This trouble seems to apply particularly to the Diptera, and it is unfortunate that the very first page of text is accompanied by a large head of a female *Tabanus* labelled "Gasterophilus equi".

The text is more extensive than in many pictorial works of this kind, and is quite detailed enough for the general reader. Occasionally it descends to such banalities as: "La ponte des Hémiptères n'est pas très originale : . . .".

Apart from the incorrect captions, this is altogether a pleasant work to possess. Since no price is quoted it cannot be said whether or not it is good value for money. H. OLDROYD

MEYRICK'S MICROLEPIDOPTERA

Catalogue of the Type Specimens of Microlepidoptera in the British Museum (Natural History) described by Edward Meyrick

By J. F. Gates Clarke. Vol. 3: Tortricidae; Olethreutidae; Noctuidae. Pp. iv+600. (London: British Museum (Natural History), 1958.) 120*s*.

THIS, the third volume of a planned series of six or seven, is the second of those devoted to illustrating the type-specimens of species described by Meyrick. It deals with some 380 species of Tortricidæ, and 567 of Olethreutidæ, while the inclusion of a single noctuid results from an original misidentification at family level. A prefatory note states that several old names of long-standing use have been dropped. As a result of this and other redispositions new combinations abound, notably in *Acleris*, *Archips* and *Olethreutes*. It is explicitly stated, however, that the new combinations do not necessarily represent a definitive evaluation; but there is no indication which combinations have such provisional status.

In each family the arrangement is alphabetical, both for genera and species, with cross-references to specific synonymy but not to intergeneric transfers. The latter omission is apt to occasion the reader a long search if he should fail to locate a species in its customary genus. The text referring to each species gives the original bibliographical reference, and the wing-span and locality of capture of the type, the number and sexes of the original series, an indication or designation of the type specimen, and an explanation of the accompanying illustrations. Comment is sparse and usually restricted to correction of errors or clarification of obscurities. The 298 plates illustrate photographically the fore- and hind-wing of each species, the genitalia of most and the labial palpi of some. Where the type is the basis of a genus, a line illustration of the wing venation is also given.

The task of presenting taxonomically significant data by means of photographs has been successfully accomplished (though some of the genitalic photographs are barely free from ambiguity) and the uniform arrangement of the illustrations makes the plates satisfying as well as informative. So far as possible, the illustrations have been arranged to face the text to which they refer, a real convenience which justifies an occasional unwelcome displacement of species. The volume, like its immediate predecessor, gives enough data to permit identification of almost all the species discussed, and will be a mine of source data in revisionary work.

Considered from the point of view of a pioneering work in dissemination of critical data on type specimens, this series may well form a pattern for later catalogues of Lepidoptera; but it is to be feared that in comparatively few other groups of insects will photographic representation meet the standard of illustration required. R. G. FENNAH

PROBLEMS OF HUMAN FERTILITY

Modern Science and the Human Fertility Problem

By Richard L. Meier. Pp. xiii+263. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1959. Sponsored by the Conservation Foundation, New York.) 48*s*. net.

HERE is a book which was badly needed. It deals with one of the most urgent of the many problems facing mankind at the present time—the menacing increase in the world population. In an early chapter entitled "Equilibrium in Human Population", the author states that "the foreseeable limit is set by the quantity of energy that is steadily reaching us from the Sun". It depends also upon an estimate of the minimum human (*per capita*) "requirements for energy in efficiently organized civilizations". The present rate of population increase works out at 1·6 per cent, and the author estimates that the limits of continuous energy supply may be overtaxed by A.D. 2100, a date which is only five or six generations ahead of us from now.

Dr. Meier's review of the situation is the completest that I have yet come across. In an early chapter he examines the population problem on a miniature scale as it exists in the island of Puerto Rico, where the general population density now exceeds that of any European country. He made a personal study of the situation among the poorer families and also the attitude of the Puerto Ricans to attempts of the authorities to introduce contraceptive measures. He describes the unexpected popularity of surgical sterilization of overburdened mothers, and the reactions of the various religious denominations to birth-control measures in general. Finally he tells us that the situation has been prevented from becoming critical in Costa Rica by a continuous overflow of the population on to the mainland. The author also made a similar study of the problem in the over-populated island of Mauritius.

Later chapters of his book deal with the future measures which will be required for staving off disaster, and the discovery of an ideal method of contraception is the most pressing need of all. All experts on this subject agree that what is required is a preparation which can be taken by the mouth and which is guaranteed to cause no harm. This pill may work in various ways; by inhibiting ovulation or the nidation and the development of the fertilized ovum; or by inhibiting spermatogenesis in the male. But there are other links in the chain of fecundation which might be broken artificially and these possibilities are reviewed by the author in an appendix. He rightly deplores the fact that whereas immense sums of money can easily be raised for research on a cure for cancer, there is little financial support for what is a far more urgent human problem. But Dr. Meier does not despair. He believes that the situation "is such that we must not reasonably expect to find that the first mass manufacture and use of oral contraception will come into being before the 1970–75 period".

Dr. Meier's book is the completest and the best survey of the world population problem which has yet appeared, and it is a work which is indispensable to everybody who is interested in this all-important subject.

KENNETH WALKER

TEXTILE ENGINEERING

Textile Engineering Processes

Edited by Prof. A. H. Nissan. Pp. ix + 366. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1959.) 60*s.*; 9.25 dollars.

MODERN textile industry is becoming increasingly dependent for its future prosperity on the recruitment of graduate scientists and engineers, so that it can derive the greatest benefit from modern scientific discoveries arising from research and development into textile materials and processing. Several books are available in which the chemical and physical aspects of textiles are discussed, but little has been written with the needs of engineers in mind. Such a book has become more necessary now that the Institution of Mechanical Engineers has created an option in textile engineering in the examination for the associate membership.

The present volume is intended to give to engineers a concise account of the processes involved in converting fibres into fabrics, special attention being paid to the mechanical aspects of the subject. Difficulties of writing such a work are considerable, for the textile industry is divided into many specialized sections. Prof. Nissan has, however, been successful in obtaining several collaborators, each of whom is a specialist in his own field. It is impossible to survey all the important aspects of textiles in the space available, and consequently attention has been limited to the following topics: physical properties of textile fibres, yarns and fabrics; the principles and techniques of yarn and cloth production, including knitting; wet finishing, and dyeing and printing machinery. Rather more specialized accounts of the important topics of drying, humidity control, and automatic control complete the volume. Each chapter is in effect an essay on a particular aspect of textile processing. The various authors appear to have interpreted their terms of reference rather differently, but all have given clear and concise accounts of their subject. Some have treated topics in a general descriptive way while others have chosen to discuss specific aspects in greater detail. These differences are offset to some extent by the suggestions for further reading given at the end of each chapter.

The book is a welcome addition to the literature on textiles. As an introduction to the subject, engineers and physicists will find it useful particularly in its treatment of yarn and cloth manufacture, while those already acquainted with textiles will appreciate the parts dealing with more specialized topics. It is unfortunate that the book is so expensive; if the present trend in the price of text-books continues, students will soon be unable to buy them.

C. S. WHEWELL

BONDS BETWEEN RUBBER AND METAL

Rubber to Metal Bonding

By Dr. S. Buchan. Second edition, revised. Pp. xiv + 300 + 35 plates. (London: Crosby Lockwood and Son, Ltd., 1959.) 42*s.* net.

THE first edition of Dr. Buchan's book, published in 1948, described the technological situation as it existed after the intense effort of the War. Most of it was concerned with the very successful brass plating method of achieving bonds between rubber and metal, and Buchan's own work, aimed at understanding the mechanism as well as rigidly controlling the product, was naturally described in great detail. The evidence he presented pointed strongly to a sulphur bond between the copper of α-brass and the rubber. A further ten years have passed; but our knowledge remains where it was, and one is led to question the usefulness of printing a second edition. True, the revision has been thorough, as all chapters bear evidence by the addition of more recent information from the literature and from the author's experience with the newer chemical bonding agents, but the scientific situation remains unaltered and the chapter on the nature of the rubber-to-metal bond, although rewritten, is weak.

Technologically, the book is still comprehensive and indispensable because it gives practical details, formulæ and, most important, the test results obtained. Some processes, such as latex-blood albumen, are now obsolete and could have been deleted, while the space devoted to the brass-plating method, although valuable, would give the newcomer a false idea of its present popularity. The reviewer knows of no new plants for producing bonded rubbers by this method, while some have actually closed down or retracted in scale. The new chapters on chemical methods added to the second edition do not make this point nor do they give any indication of comparative processing or capital costs. Is it just this factor that has told against the brass-plating process?

There are a few minor blemishes for which the publisher must be blamed. A large proportion, in fact nearly all, of the graphs shown are not professionally drawn, and the lettering is bad. 'm.m.' for 'mm' is irritating as well as wrong. 'G.R.S.' for 'GR-S' is inelegant and in any event it was superseded during 1957 by 'SBR', which is now universally used as the abbreviation for butadiene-styrene rubber.

W. C. WAKE

The Morphology and Anatomy of American Species of the Genus *Psaronius*

By Jeanne Morgan. (Illinois Biological Monographs, No. 27.) Pp. vii+108. (Urbana, Ill.: University of Illinois Press, 1959.) Paperbound, 3 dollars; Clothbound, 4 dollars.

THE name *Psaronius* is applied to certain fossil tree-fern stems of Permian and Carboniferous age. The author in this monographic treatment of the American *Psaronii* describes three new species of Pennsylvanian Age from the United States and suggests that there are in all six valid species of the genus in America. From a careful study of about twenty-three specimens she has been able to allocate them to the three new species. There is considerable variation among the specimens allocated to any one species; but this variation, which is principally manifested in varying complexity in the polycyclic stelar anatomy, is due, she assumes, to ontogenetic variation such as is found in existing tree-ferns where the relatively small and simple stelar arrangements at the base of the tree formed in its sporeling state are succeeded higher up by increasingly complex cyclic polystelic arrangement. Some corroborative evidence in support of this assumption is obtained from specimens in which a considerable length of a stem has been found. She gives an account of the complex relationship between the several cycles of meristeles and the leaf-trace system connected to it. She also shows how the phyllotaxy may change between the base and upper parts of a stem, new orthostichies being intercalated and sometimes a spiral phyllotaxy is replaced higher up by a whorled arrangement of leaves. In places her descriptions are difficult to follow; a greater use of lettering on the diagrams would have helped the reader to follow her arguments. She places these fossils in a separate natural order, Psaroniaceae, although a good deal of evidence supports the view that they are related to the Marattiaceae. It is, however, a very useful contribution to our knowledge and is well illustrated and adequately indexed. JOHN WALTON

Astronomical Photography at the Telescope

By Thomas Rackham. Pp. 232+11 plates. (London: Faber and Faber, Ltd., 1959.) 36*s*. net.

MOST popular works on astronomy are illustrated by a series of impressive photographs taken with the world's largest telescopes. The casual reader may therefore get the impression that the photographs taken with smaller telescopes of the size owned by the average amateur astronomer are correspondingly poor and uninteresting. However, this is not necessarily the case, and in this book Mr. Rackham explains to the reader the techniques which he has perfected by many hours at the telescope. After clearing the ground with a lucid account of the basic photographic process, he proceeds to describe in detail the instruments and accessories used—nearly all capable of construction by the intelligent layman. The most common subjects of photography for the amateur astronomer are the Sun, Moon, Mars, and Jupiter, of which the individual difficulties are discussed at length. The photography of star fields, either through a telescope or by means of an ordinary camera, is not treated so fully; for this the reader is referred to King's "Manual of Celestial Photography". The chapters on practical processing and darkroom technique should answer all conceivable queries, although the professional astronomer will be surprised to find film almost invariably used instead of plates.

In conclusion, the book can be best summarized in the author's own words—"The amateur's work may not always be of scientific value . . . but it will introduce him to the many wonders of astronomy where they are properly to be found—not in books, but in the sky". D. H. P. JONES

Physical Geography

By Philip Lake. Fourth edition, edited by J. A. Steers. Pp. xxviii+483+25 plates. (Cambridge: At the University Press, 1958.) 25*s*.

PHILIP LAKE'S "Physical Geography" was first published in 1915 and so quickly established itself as to be reprinted a dozen times before the author's death in 1949. It was in that year that the second edition appeared, re-written rather than revised by a team of Cambridge geographers under the leadership of J. A. Steers. Whether or not one accepts the definition of geography as human ecology it will be universally agreed that a proper understanding of man's environment demands a knowledge—it may be general but must be soundly based—of the physical factors of that environment. The successive editions of Lake have sought to incorporate the results of work in the now numerous related fields of study. To the old three-fold division into the atmosphere, the ocean and the land, still preserving such empirical chapters as 'coral reefs', 'volcanoes' and 'lakes', have been added in this latest edition three more chapters on floods and storms—a by-product of Prof. Steers's special concern with the East Coast floods of 1953—on soils by A. T. Grove, which brings in some, but not very much ecology, and on marine life by A. J. Lee. It has sometimes been said that a student entering the Cambridge School of Geography will enjoy excellent series of lectures by specialists but will be left to discover for himself the integrated whole which modern geography should be. Something of the same criticism applies to the latest edition of Lake's "Physical Geography". L. DUDLEY STAMP

Classification and Indexing in Science

By B. C. Vickery and D. J. Foskett. Second edition, enlarged. Pp. xix+235. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1959.) 30*s*.; 6 dollars.

THE second edition of this book has been considerably expanded without affecting its character as a study of method rather than a manual of classification and indexing. The first three chapters and appendixes are almost unaltered apart from some transpositions in the appendix dealing with historical aspects and an extended treatment of the Universal Decimal Classification. Those on "Indexing" and on "Classification and Mechanical Selection" have been transposed: the former now includes a brief section discussing the indexing of chemical compounds and the latter some account of mechanisms used for retrieving information and examples of the subject analysis and coding used. The bibliographies of these two chapters and also of the following chapter "The Future of Information Retrieved", which has been completely re-written to take account of developments reported to the International Conference on Scientific Information at Washington in November 1958, have been expanded. R. BRIGHTMAN

THE ROYAL SOCIETY'S EXPEDITION TO HALLEY BAY DURING THE INTERNATIONAL GEOPHYSICAL YEAR

ON February 4 the Royal Society spent a day listening to accounts by various members of the expedition to Halley Bay of the work done in Antarctica by the British team during the International Geophysical Year.

The discussion was led by Sir Graham Sutton, who began by recalling that although a proposal to mount an international expedition to explore the Antarctic continent had been made as long ago as 1861, it was not until the present century that any significant progress was made. The initial phase, of wooden ships and animal or man-drawn sledges, culminated in the large expeditions of 1910–15, and although conditions are vastly different to-day, there are still hardships and even perils to be faced. The choice of a site in the Weddell Sea area was dictated by a number of factors ; but there is no doubt that, from the geophysical aspect, the area is of great interest.

Mr. J. MacDowall (who was the leader of the expedition in 1958) opened the discussion with an account of the work done in seismology, glaciology and meteorology. The observatory was built on a floating ice shelf 29 m. above sea-level in latitude 75° 31′ S., longitude 26° 37′ W. Considerable microseismic activity was observed during the summer (December–February), especially with on-shore winds, and he gave examples to show the relation between microseisms and wind force. The short-period three-component Willmore seismograph used on the floating ice shelf was found to detect P-waves at most epicentral distances, but S-waves were badly recorded. The shelf itself had a yearly addition of about 1 m. of snow of mean density $0\cdot36$ gm. cm.$^{-3}$. Considerable ablation occurred, even in winter, and it is not easy to account for this in terms of the energy balance.

Mr. MacDowall directed attention to the small range of monthly mean air-temperature through the troposphere compared with the very large difference in extremes in the stratosphere, where the records indicate a range of 59° C. at the 30-mb. level. Another interesting fact is that there is a notable difference between the northern and southern hemispheres in the seasonal change in atmospheric ozone. The spectrophotometer measurements of the total amount of ozone made at Halley Bay during 1956–58 do not appear to fit into the hitherto accepted global pattern of seasonal and latitudinal variations, and only the short-period fluctuations were found to be related to upper-air measurements. In south-east England both the long- and the short-period variations are related.

Mr. J. M. C. Burton described observations on the nature of the ice shelf and drew the conclusion that it is partially grounded to the east-north-east, but floating to the south. He suggested that the Dawson Lambton glacier should be taken as the true coastline. The Allan MacDonald glacier, which Shackleton reported in 1914 some 30 miles north of the Dawson Lambton glacier, was not seen during the two years of the International Geophysical Year, and he regarded its existence as doubtful.

Commenting on these contributions, Dr. R. C. Sutcliffe dealt with the ozone distribution and suggested a possible explanation in terms of a thermal circulation. Mr. H. H. Lamb continued with an analysis of upper-air measurements. He pointed out that it is only since 1957 that any general picture of stratospheric circulation over the Antarctic can be constructed, and of the three years in question, it seems fairly certain that 1959 was anomalous in the late winter and spring in regard to winds, temperatures and maximum amounts of ozone in the stratosphere.

Mr. W. H. Bellchambers and Mr. W. R. Piggott described the ionospheric measurements. The Halley Bay observatory, being near the centre of the Weddell Sea geomagnetic anomaly and yet sufficiently outside the auroral zone to avoid the effects of minor corpuscular magnetic or auroral activity, is particularly well placed for the study of the electrified part of the atmosphere. The main conclusions reached are that the $F2$-layer variations are dominated by movements of ionization (which can also be seen near the maximum of the $F1$-layer), and that ionization drift velocities in the E-region reverse with season and are greater in winter than summer. The incidence of 'spread F' is very anomalous, being essentially a magnetically 'quiet day' phenomenon.

In the general discussion, Dr. R. L. Smith-Rose, after paying tribute to the excellent work done by the team, remarked that two features of the results were surprising. In the temperate and auroral latitudes of the northern hemisphere severe 'spread F' is closely correlated with magnetic and auroral activity and is well known as a precursor to the failure of trans-Atlantic radio communication. At Halley Bay, on the other hand, it seems to be associated with relatively quiet conditions. Again, in the northern hemisphere the maxima and minima of $foF2$ are approximately at the same local mean time at most ionospheric stations. This does not suggest the type of movements proposed by the speakers. He asked if there is evidence for any fundamental difference in the behaviour of the layer in the two hemispheres.

Mr. P. M. Brenan and Mr. D. P. Harrison gave an account of the work in radio astronomy. It was found that ionospheric velocities, deduced from the motion of the diffraction pattern on the ground, were approximately towards the west in the first part of the night and towards the east for the remainder of the night and most of the following day, the reversals taking place about 0030 and 1630 L.M.T. The speeds were of the order of 400 m.sec.$^{-1}$ in the evening, falling to about 100 m.sec.$^{-1}$ in the easterly motion. The times of change and the magnitude of the drift speeds agree with measurements of the motions of auroral forms made at Halley Bay by S. Evans (1959) using an all-sky camera.

For radio-echo observations of auroræ and meteors, a low-power equipment working with a rotating aerial on a frequency of $71\cdot3$ mc./s. was used, similar to that at Jodrell Bank. The auroral echoes fit closely the case of specular reflexion for columns of ionization aligned along the local magnetic field at about 100 km.

Commenting on these papers, Dr. J. G. Davies remarked that a clear correlation between the peaks of auroral activity at Halley Bay and the rarer auroral echoes at Jodrell Bank has been demonstrated. The scattering mechanism is clearly specular. He pointed out that in the auroral case, as well as for the work on radio-source scintillations, the fact that the observations appear to be in regions of increased ionization elongated along the direction of the local magnetic field suggests that these may be extensions of the van Allen radiation belts, and may represent the mechanism whereby the radiation zones drain into the atmosphere.

Dr. S. Evans and Dr. G. M. Thomas gave an account of the visual work on aurora. An all-sky camera was used. A plot of the hourly-mean vector movement indicated a systematic diurnal component, reaching a few hundred metres a second in the easterly and westerly directions. Comparison with the horizontal magnetic disturbance vector averaged over the same period was held by Dr. Evans to imply an effective transport of negative charge by aurora.

Dr. Thomas said that a feature of the auroral display at Halley Bay was the almost continuous presence of a quiet arc lying well to the south. There is evidence, supported by observations in other localities, that there is a migration of quiet arcs to higher latitudes at times of maximum sunspot activity.

Mr. J. Paton, discussing these results, speculated whether the small movement in the position of the quiet arcs recorded at Halley Bay between 1956 and 1958, if it is real, is related to changes in the form of the outer van Allen radiation belt during the period between sunspot minimum and maximum. He also asked if the observations now indicate that the phenomena of 'flaming' occur only on the equatorial side of the auroral zones, and that the somewhat surprising rarity of red coloration in the Halley Bay displays indicates the general rule that persistent red diffuse surfaces are very limited in their geographical position, being virtually confined to the middle latitudes.

Sir Graham Sutton, summing up, said that, in his opinion, the Society had been amply justified in its decision to send an expedition to this remote part. The data obtained seemed to be unique in many ways.

The president of the Royal Society, Sir Cyril Hinshelwood, in closing the meeting, paid tribute to all who had taken part, and said he had never had any doubt that the Halley Bay venture would be worth while. From what he had heard, the geophysical services would benefit greatly.

The contributions and a report of the discussion will appear in a forthcoming number of the *Proceedings of the Royal Society*. O. G. Sutton

THE TEACHING OF VETERINARY ANATOMY AS A BRANCH OF BIOLOGY

ITS RELATIONSHIPS TO HUMAN ANATOMY

By Dr. R. A. GREEN

Sub-Department of Veterinary Anatomy, University of Cambridge

EVERYONE has the opportunity of gaining inside knowledge in one only of the sciences—biology. He carries around with him until he dies a living specimen about which he can know something at first hand. This intimate knowledge of vital activity is not only unique, it also carries with it a greater depth of understanding than is possible by the use of the intellect alone. Certain branches of knowledge like mathematics claim to depend on the use of pure reason. Any branch of the natural sciences, however, makes use to some extent of man's knowledge of his own body.

Anatomy is fundamentally a branch of biology but, based historically on cadavers and the descriptive method, it is often thought of as a dead science—in more ways than one. It is also mistakenly considered to be a highly concrete science because it deals with the gross aspects of structure which are not only three-dimensionally solid but which can also be prodded with the fingers. To bring the dead organs to life, an older generation therefore added 'function' as something over and against 'form'. Thus was born one of the many antitheses that used to divide biologists into two warring camps. Nowadays they are mostly too busy being experimentalists to worry about these many unsolved problems, and this is no doubt why words like 'teleological' and 'Lamarckistic' are used less often as epithets of derision.

In fact, as Woodger first remarked[1], the antithesis of form and function is readily resolved in terms of ideas on space/time. A dead organ, far from being one of the most concrete elements in biology, is one of the most abstract. It is a four-dimensional object, from which the dimension of time has been removed. Living structure, by its very nature, has a history. It is changing from moment to moment. Form and function are but two aspects of a single entity—a living organism. To consider any living organism from one only of these two aspects is a highly artificial abstraction from reality. Similarly, because the organism is a structuro-functional whole, considerations in isolation of one of its several organ-systems or of separate organs are still further stages in abstraction, invented by the mind of man. Thus, living structure *is* function.

For some years now in the teaching of human anatomy there has been a tendency to depart from the older descriptive method of dealing with gross structure. Function is introduced in many places, and organs are dealt with in terms of the functions which they are designed to carry out in life. This is occasionally an overtly teleological approach which is all to the good; for, as MacDougall once said[2], there are quite clearly two kinds of causation at large in the world—mechanical and teleological—and, of these, teleological causation is fundamental. Man conceived the idea of inanimate objects pushing each other about because of what he knew at first hand of the results of using his own muscular energy; and, in as much as events happen in the realm of living things *as though* those events were purposive[3]—it does not seem a serious sin to treat them that way if to do so is to further understanding. To hold the opposite view, that in order to be scientific, any statement concerning living things and how they act or are made must be based on a materialistic philosophy, is merely to display a narrow dogmatism that in no way accords with the facts of observation[3].

There was a time when observation played a prime part in the biological sciences. From it was born the descriptive style of anatomy; but like any thought-method indulged in as a specialization this eventually began to defeat itself[4]. The sheer accumulation of descriptive facts began to have an arid effect and became intellectually unsatisfying. Certain details began to be relegated to smaller print, and innovations were made, such as considering the functions of the parts being described.

As well as considering function, attention was also given to those other aspects of the fourth dimension—development and evolution. The embryology of organ-systems has for many years now been a standard part of the background of teaching gross human anatomy and, in most centres, at least some attention is also given to comparative anatomy, by way of emphasizing among other things the specializations involved in man having an upright posture. In some centres a more detailed study is made along almost zoological lines to paint in more of the history of the vertebrate body.

The beginnings of a serious study of the anatomy of domestic animals were made before the already highly developed human anatomy began to break with tradition. It was inevitable, therefore, that the method established in human anatomy was directly imitated. Having, however, to deal with some five different mammals, attempts at a comparative approach, although along purely descriptive lines, were made at the outset. As time passed, many teachers of veterinary anatomy grew aware of the deficiencies of the purely descriptive approach and introduced function and embryology along with a description of parts. But this was seldom a true grafting-on of new material. The current state of development of the teaching of human anatomy gives opportunities for radical changes in approach by veterinary anatomists along avenues less accessible to those that originated them.

Human anatomists are in a difficult situation in the matter of how much descriptive detail to include in their courses. Obviously, their students will need to know the structure of certain parts in considerable detail in their clinical years, and too much cannot be left to the surgeons to teach without a radical alteration being made in medical students' courses. Certain critics maintain that all descriptive anatomy should be applied anatomy and taught alongside surgery. Although this would obviate the difficulties inherent in expecting students to remember structural details with several years gap between pre-clinical anatomy and surgery, it would relegate anatomy to pure technological training. It has more to offer a student than that. But the problem of where to draw the descriptive line is certainly an acute one.

This particular problem is far less pressing in the teaching of veterinary pre-clinical anatomy, for the amount of applied descriptive detail required by even a specialist in surgery is far less. The detail chosen for treatment should, of course, be selected with one eye on its applied value; but even so, the main criterion of choice is its biological value. Which structural details can best be shown as structure-in-action? This is one of the basic yardsticks for selection. Which details can best be treated as examples of adaptation to function against a background of evolutionary and developmental change? Finally, in this choice of what to leave out and what to put in—what other details must be included in order to give a rounded picture of the whole structuro-functional organism rather than merely a pastiche of disconnected parts.

Having, of necessity, to begin with a comparative approach, in order to deal with the structure of odd- and even-toed Ungulates and the Carnivora, among mammals, and of domestic poultry, among birds, it is obviously relevant to include something on reptiles, from which both later classes devolve. In turn, reptiles are only meaningful in matters of structure if their earliest representatives are coupled with early amphibians and treated as the first tetrapods in contrast to fish-like vertebrates. Thus, a more than superficial survey of the vertebrate body is a natural corollary to the teaching of veterinary anatomy. In this way it also joins forces with the dogfish, which the framers of early First M.B. courses in their wisdom included in its syllabus. In human anatomy courses the introduction of much comparative anatomy can be frowned upon as overloading the student. There is no need for a similar criticism in veterinary anatomy courses, where the subject-matter quite naturally demands it.

The embryology of the various organs of the mammalian body falls naturally into place alongside their evolutionary history and their gross form. That is to say, a unified course of all three approaches—not three separate courses. One of the major difficulties here is the absence of appropriate text-books. All the best text-books on mammalian anatomy and embryology are written for medical students. The various adaptations relating to upright posture and the rather more subtle differences due to precocity in development of many organs are not necessarily emphasized by the authors, for their subject-matter is man. For the veterinary student, these differences are a source of confusion, and time has to be consumed in interpreting them in terms of domestic animal anatomy. This very difficulty, however, contains an opportunity. Human anatomists give courses in quadrupedal anatomy. In veterinary anatomy there should be a course of comparative human anatomy. This would not only serve as a guide to existing text-books but would also fulfil two other wider and more valuable purposes—a means of liaison between medical and veterinary professions containing the elements of a common language between the two, and an important part of general education. Comparative medicine is now being given increasing attention; but the foundations of any training are laid in its early years—in this case, in pre-clinical courses. No opportunity should be lost in general education of increasing the spread of knowledge about the human body, and for any student of animal biology a course on this subject should be a constant feature.

As well as having a long-established method of instruction and varied text-books for learning his anatomy, a medical student has another tremendous advantage over a veterinary student. He carries around with him a living text-book. To a non-medical observer, the behaviour of medical students while taking an oral examination is very interesting. All but the weaker candidates will make repeated reference to their own bodies when in the process of answering questions. Their examiners probably barely notice this, except to remark its absence in the poor candidates. It is a method of learning that comes naturally to the student, and all concerned, examiners and examinees, take it for granted. Although it has obvious restrictions, mainly to surface structures, it is nevertheless a means of knowing living anatomy that many a medical man almost certainly makes use of throughout his professional life. He adapts it later by asking patients to carry out various voluntary movements and noting the results, but his unconscious reference point is probably still his own body.

Both the approach and its adaptation would seem to be denied to a veterinary training. The use of living animals for palpation and observation, or the showing of films or cine-radiographs of living structures is never as effective, because full subjective participation on the part of the students is always absent. There is, however, a way around this difficulty. Fortunately, the most generalized of the domestic animals, the dog, differs in only a limited number of structural details from the anatomy of man. The comparative course in human anatomy could stress these differences to the veterinary student. By learning about his own body, which in itself contains an interest drive for any biology student, he can allow for the differences between his own anatomy and that of his subject animals and thereby use his own living text-book in a similar way to a medical student.

Modern anatomy is thus far from being a dead science, but, what of the criticism that it is too time-consuming in this age of specialization to warrant its continuance as a part of pre-clinical training, even in its modern forms ? This criticism can perhaps be levelled even more readily at veterinary than at human anatomy because of the more restricted nature of its descriptive subject-matter. Most anatomists, after making full allowance for the axe they have to grind, are confident of the importance to the students of what they are seeking to do for them, in courses that must remain pre-clinical. The actual putting into words of what is often an instinctive conviction, accumulated through years of teaching, is however sometimes not easy to make. Surely one of the main answers lies in this matter of anatomy being a branch of biology ? In this day and age where machines have invaded the world of biological research, and observation of living animals without interference experiments is a rarity, there is an increasing need to offset this mechanistic trend by laying foundations in the biology of the normal. The changes from the old descriptive method have rendered this possible, and, as technology advances, the importance of emphasizing what can now be taught as living anatomy will increase rather than diminish. By adding to the observations of living subjects the inside knowledge a student can have from his own body, use is made of the insight into a science which belongs to biology alone. Not to develop this insight in a world of advancing technology might well be to lose the very substance of that old but still undeniable claim that medicine, whether human or veterinary, is an art as well as a science.

RIBONUCLEIC ACIDS AND THE SYNTHESIS OF CELLULAR PROTEINS*

By Prof. J. BRACHET

Laboratory of Animal Morphology, Faculty of Sciences, University of Brussels

It is hard to believe nowadays how confused the whole field of nucleic acid biochemistry and localization was some thirty years ago: it was thought, for example, that thymonucleic acid was only found in animal cells, while yeast nucleic acid was a specific constituent of vegetal cells. We know now that thymonucleic acid is only one representative of the deoxyribonucleic acids, while yeast nucleic acid is just one of the many ribonucleic acids which are now known to exist in all kinds of cells. Regarding the role of deoxyribonucleic acid, all one could suggest was that it might play the part of an intranuclear *p*H buffer.

Progress and clarification in this field largely came from unexpected quarters, namely, from cytochemical and embryological work: for example, the introduction in the realm of cytochemistry of the specific Feulgen[1] reaction for deoxyribonucleic acid was a major event, since it led to the demonstration of two important facts: deoxyribonucleic acid is strictly localized in the chromatin of cell nuclei, and it is present in the nuclei of all cells, whether they are of animal or vegetal origin.

Work in the thirties by the Needhams[2] and by me[3] on the synthesis of nucleic acid in developing sea urchin eggs also led to important conclusions: it was found that cell multiplication, during embryonic development, is linked with the synthesis of deoxyribonucleic acid and that the site of this synthesis is strictly nuclear. No important reserve of deoxyribonucleic acid, sufficient to allow nuclear multiplication until the larval stages were reached, could be detected in the cytoplasm; the latter, however, already contains large amounts of nucleic acids, in unfertilized eggs. Since this nucleic acid cannot be deoxyribonucleic acid, it must be ribonucleic acid; the latter can therefore no longer be considered as a specific constituent of plant cells. The hypothesis of a conversion of ribo- into deoxyribonucleic acid during cell division was an apparently logical conclusion to draw from all this work. How much of these conclusions remains true nowadays? A good deal, since the universal occurrence of deoxyribonucleic acid in cell nuclei and its synthesis during cell division are now well-established facts; the presence of ribonucleic acid in the cytoplasm of all cells is also generally accepted. The only major flaw in the theory was the hypothesis of the conversion of ribo- into deoxyribo-nucleic acid, which was not on a sufficiently sound basis; but, although such conversion certainly does not occur on a very large scale during egg development, recent biochemical work has shown that many organisms, including embryos, contain enzymes which transform ribonucleosides into their deoxy-counterparts and, ultimately, into deoxyribonucleic acid.

---

* Substance of two Special University Lectures delivered at King's College, University of London, on January 26 and 27.

More progress in our basic knowledge about the role and the localization of ribonucleic acid was to come from other cytochemical studies: a simple staining method, in which two basic dyes (methyl green and pyronine) are combined, allows quick and easy detection of ribonucleic acid in all cells; however, the specificity of the method must be checked by the utilization of control sections which have previously been treated with the enzyme ribonuclease in order to remove the ribonucleic acid they contained (Brachet[4]). Simultaneously, Caspersson[5] worked out a more complicated and more costly method of detection of ribonucleic acid based on the strong ultra-violet absorption of the purine and pyrimidine bases which enter into the constitution of the nucleic acids.

Extensive use of these two methods led, independently and simultaneously, Caspersson[5] and me[4] to the same general conclusion: ribonucleic acid is a universal constituent of all living cells, whether they are of animal, vegetal, or bacterial origin. It is localized in the nucleoli and in the cytoplasm, although variable amounts are found in chromatin as well. Furthermore, there is a remarkable correlation between the ribonucleic acid content of a given cell and its ability to carry out protein synthesis: cells which are metabolically very active, but do not synthesize large amounts of proteins (kidney, heart, muscle cells, for example) have a low ribonucleic acid content. On the other hand, cells which synthesize large quantities of enzymes in the pancreas or the gastric mucosa, as well as the silk-secreting cells of silk worms, contain very large amounts of ribonucleic acid in their cytoplasm and their nucleoli. Finally, when protein synthesis is increased or decreased by experimental means, such as fasting or hormone injection, parallel changes in the ribonucleic acid content of the affected cells can be detected.

More recently, the advent of a new and powerful cytochemical technique, autoradiography, has entirely confirmed these conclusions (Brachet and Ficq[6]): there is an excellent, almost perfect, parallelism between the incorporation of amino-acids into proteins (which is a measure of protein synthesis) and the ribonucleic acid content of all the cells which have been studied.

Quantitative Measurements

Since cytochemical methods do not lend themselves so easily to quantitative work as straight biochemical techniques, it was important to confirm the cytochemical results with quantitative methods: this has been done[7,8] repeatedly, and all that need be said here is that the agreement between the two types of technique is remarkable. We can thus from now on consider the correlation between the ribonucleic acid content and protein synthesis as a well-established fact, and we can draw the conclusion that ribonucleic acid somehow takes a direct role in protein synthesis.

A consequence of this conclusion is that there should also be a correlation between ribonucleic acid content and protein synthesis at the subcellular level: it means that the small particles rich in ribonucleic acid which have been known as microsomes since the work of Claude[9] should be more active in the incorporation of amino-acids into the proteins than the other cell fractions (nuclei, mitochondria, cell sap) which are poorer in ribonucleic acid. The correctness of this prediction has been confirmed many times and, more recently, it has been possible to go one step further and to isolate from the microsomes, by suitable treatment with bile salts, particles which are much smaller and have a still higher ribonucleic acid content than the microsomes: they are the so-called 'ribosomes', which contain as much as 40 per cent ribonucleic acid. It was found, as one would expect, that they are unusually active in the incorporation of labelled amino-acids into proteins[10]. In fact, these ribosomes are now considered by most biochemists as the main site of synthesis of cytoplasmic protein, in bacterial as well as in vegetal and animal cells. Of great interest also is the finding that treatment of microsomes by ribonuclease, in order to destroy the ribonucleic acid they contain, quickly inhibits their ability to synthesize proteins[11]. It can therefore be safely concluded that the above-mentioned relationship between ribonucleic acid content and protein synthesis holds true at the subcellular as well as the cellular or histological level; furthermore, the integrity of ribonucleic acid, in subcellular particles, is necessary if the ability to synthesize protein is to be retained.

But the first clear-cut demonstration of a direct role of ribonucleic acid in protein synthesis came from an entirely different field: the study of the multiplication of plant viruses, especially tobacco mosaic virus. After the demonstration by Markham[12] and by Jeener[13] that the protein part of tobacco mosaic virus (which consists of ribonucleic acid and protein only) is not infective, it was established beyond doubt by Gierer and Schramm[14] and by Fraenkel-Conrat[15] that viral ribonucleic acid, if properly extracted and isolated, is infectious. Treatment of this ribonucleic acid with ribonuclease immediately abolishes the infectivity. A very important point in these experiments is that when viral ribonucleic acid gets into tobacco leaves, it not only reproduces itself but also synthesizes its protein counterpart and produces virus of the strain from which it originates. In other words, ribonucleic acid is the genetic determinant in plant viruses (and in all animal viruses containing ribonucleic acid which have been studied so far) just as deoxyribonucleic acid is in phages and in cells.

But viruses are very simple systems when compared with whole, living cells; for the biologist, it would be of the utmost interest to prove that the integrity of ribonucleic acid is required for protein synthesis in the case of living cells also. Experiments to test this possibility have been going on for several years in my laboratory; the technique is to add ribonuclease to the living cells and to follow such processes as growth, mitotic activity, incorporation of amino-acids into proteins and net protein synthesis. The main results can be summarized as follows[16]: ribonuclease easily penetrates many living cells, where it can accumulate to a large extent. It first breaks down the soluble (cell-sap) ribonucleic acid and then attacks microsomal and nucleolar ribonucleic acid by either breaking it down or building up an inactive enzyme–substrate complex. In any event, protein synthesis, growth and mitotic activity quickly stop, probably as a result of the initial breakdown of soluble ribonucleic acid. But it is a very remarkable fact that the deleterious effects of ribonuclease can be reversed to a large extent (and sometimes even completely) by the external addition of yeast ribonucleic acid. The experimenter can thus control, almost at will, growth and protein synthesis in living cells by playing upon the ribonucleic acid–ribonuclease equilibrium.

After these prolonged cytochemical and biological studies, the problem has finally reached the ultimate stage, the biochemical one: thanks to the work of Hoagland, Zamecnik and their colleagues[17], the mechanism of protein synthesis becomes more and more understandable. This synthesis involves three main stages: first, the amino-acids are activated, in the presence of adenosine triphosphate, by soluble enzymes, and this results in the formation of amino-acyl-adenosinemonophosphate compounds. Secondly, these compounds are incorporated into soluble ribonucleic acid; this step is very sensitive to ribonuclease in the *in vitro* biochemical experiments as well as in our own experiments with onion roots. Finally, the soluble ribonucleic acid, which now carries the amino-acid, is, in turn, incorporated into the ribosomes; there, by a mechanism which remains obscure in many respects, specific proteins, which possess the correct amino-acid sequence, are synthesized. There is no lack of hypotheses about this ultimate step of protein synthesis: the most probable one is that the ribosomal ribonucleic acid carries a 'code', which it has received from nuclear deoxyribonucleic acid; this code would be inscribed, in the ribonucleic acid molecule, in the form of a specific base sequence and it would be translated, in the finished protein, as a corresponding, specific amino-acid sequence.

Role of the Nucleus

Before we can accept such a control mechanism of cellular protein synthesis, we should know more about the role taken by the cell nucleus (which obviously contains all the genetic information) in the synthesis of ribonucleic acid and of protein.

Several methods are available for such investigations; although all of them have some serious drawbacks, it is very encouraging that they all lead to very similar conclusions. The three main methods which have been used so far are the following: (1) investigation of the incorporation of labelled precursors of nucleic acids or proteins into intact cells, by autoradiography methods; (2) comparison of nucleic acid and protein metabolism in nucleate and anucleate fragments of unicellular organisms or eggs; (3) work on homogenates, in which nuclei, mitochondria, microsomes and cell-sap constituents can be recovered by differential centrifugation. The main difficulties with these three types of methods are the following: with the autoradiography techniques, specific activities are often difficult to measure accurately, since usually we do not know exactly the intracellular concentration of the labelled precursor and the chemical composition of the cell organelle which is under study; in the case of anucleate and nucleate fragments of cells, the main limitation is that delicate ultramicromethods are necessary in order to make measurements; with homogenates, it is difficult to be sure that no adsorption or loss of chemical compounds has occurred as a result of a rather drastic procedure. Furthermore, results obtained with 'combined' homogenate fractions (nuclei + microsomes, for example) are always of doubtful significance, since the experimental conditions are too different from those which prevail in a living cell. After these preliminary, but necessary, remarks, I will now discuss briefly the results obtained with the three different types of approach.

Autoradiography work on intact cells has repeatedly emphasized the importance of the nucleolus and perinucleolar chromatin in ribonucleic acid metabolism; these nuclear constituents, in all the cases studied so far, become very quickly labelled when ribonucleic acid precursors such as adenine, orotic acid, cytidine, uridine, etc. are used. It looks as if these precursors could go through the whole of the cytoplasm without being used for the synthesis of ribonucleic acid but, once they reach the nucleus, they incorporate themselves almost immediately in the nucleolus and the surrounding chromatin. Later on, the cytoplasmic ribonucleic acid also becomes labelled to an appreciable extent. All the facts at hand thus suggest that synthesis of ribonucleic acid is extremely active in the nucleus and the adjoining heterochromatic segments; they also strongly suggest that ribonucleic acid which has been synthesized in the nucleus is transferred to the cytoplasm.

The situation is different in the case of protein synthesis: as a rule, nuclei do not incorporate labelled amino-acids at a much faster rate than the cytoplasm; the main exception of this rule is the case of eggs undergoing cleavage, where synthetic processes are practically restricted to the multiplication of the nuclei. These observations obviously suggest that the nucleus is more directly involved in ribonucleic acid than in protein synthesis (see Brachet[18] for a more complete discussion). Experiments recently carried out in my laboratory by Drs. R. Perry and M. Errera entirely confirm this general conclusion: destruction of the nucleolus by an ultra-violet microbeam exerts marked effects on the synthesis of ribonucleic acid in both cytoplasm and chromatin; but, on the other hand, it has relatively little effect on the synthesis of nuclear and cytoplasmic protein.

Nucleate and Anucleate Fragments

I now come to the work done on nucleate and anucleate fragments of unicellular organisms: in *Amoeba*, removal of the nucleus has little effect on the time of survival of the organism; but anucleate fragments quickly become unable to move and to feed: therefore they should be compared with their nucleate counterparts under fasting conditions only. Under these conditions, it is found that removal of the nucleus does not decrease appreciably the oxygen consumption; however, the anucleate halves soon become incapable of utilizing their carbohydrate and fat reserves and, instead, proteins are being broken down[18]. This protein breakdown affects various specific (enzyme) proteins to different extents: whereas protease, adenosine triphosphatase, enolase and amylase remain almost unaffected by removal of the nucleus, dipeptidase undergoes a definite decrease, and acid phosphatase and esterase almost vanish from the anucleate halves. The reason why the nucleus exerts such markedly different effects on the maintenance of a number of enzymes remains uncertain; it may be connected with different intracellular localizations of the various enzymes which have been studied so far; but this point certainly requires additional experimental work before it can be cleared up. Finally, it should be added that the incorporation into proteins of labelled amino-acids, such as methionine or phenylalanine, is markedly reduced after enucleation; this incorporation process, which can be taken as an index of protein synthesis, never stops, however, in anucleate cytoplasm so long as the latter is alive.

The effects of removal of the nucleus are much more drastic, in *Amoeba*, in the case of ribonucleic acid than in that of proteins: the ribonucleic acid content of anucleate fragments decreases quickly and strongly[19]. Ingenious experiments by Goldstein and Plaut[20] have provided direct evidence for the view that the reason for this considerable drop in the ribonucleic acid content of anucleate cytoplasm is that a large proportion of cellular ribonucleic acid is synthesized in the nucleus: grafting the nucleus of an *Amoeba* which had been labelled with phosphorus-32 into a normal *Amoeba*, they found that cytoplasmic ribonucleic acid becomes labelled. On the other hand, the normal nucleus does not take any of the label into its ribonucleic acid, a fact which suggests that ribonucleic acid can move inside the cell in one direction only, namely, from the nucleus towards the cytoplasm.

In accordance with the results which have just been presented and which suggest that the nucleus is the main centre for the synthesis of ribonucleic acid in *Amoeba*, it has been found that enucleation exerts very impressive inhibitory effects on the incorporation of various precursors into cytoplasmic ribonucleic acid. Anucleate fragments seem, however, to be able to carry on, but at a much reduced rate, independent synthesis of cytoplasmic ribonucleic acid. But the whole situation still remains somewhat obscure, since the possibility that the incorporation process might occur in bacteria which have been phagocytized by the *Amoeba* without being killed has not yet been ruled out satisfactorily.

The biochemical activities of anucleate cytoplasm are much greater in the unicellular alga *Acetabularia mediterranea* than in *Amoeba*: it was found by Hämmerling[21] that anucleate halves not only survive for several months, but also that they are even capable of extensive morphogenesis (cap formation); it is therefore not surprising that these anucleate fragments are capable of net protein synthesis, including that of specific enzymes such as aldolase, phosphorylase and fructosidase[22-24]. Although the genes control, as we know, the synthesis of the many enzymes which are present in the cells, removal of the nucleus has nevertheless no immediate effect on enzyme synthesis. It should be said, however, that protein and enzyme synthesis cannot go on for ever in the absence of the nucleus, and that it stops completely after three or four weeks.

The case of *Acetabularia* raises a number of important problems for all those interested in molecular biology: morphogenesis and synthesis of specific proteins can obviously occur, in this case, in the complete absence of the genetic material. There must therefore be an intermediary between deoxyribonucleic acid and the proteins: Could it be that cytoplasmic ribonucleic acid carries the genetic information originating from the genes, and controls, for a certain time in any event, synthesis of specific protein? If so, is this ribonucleic acid of nuclear origin? Is it possible, by experimental means, to suppress the expression of the information which the anucleate cytoplasm has formerly received from the genes? While no clear-cut answer can be given to any of these important questions, recent experiments shed a certain amount of light on them.

Regarding first the behaviour of cytoplasmic ribonucleic acid in anucleate fragments, recent experiments by Dr. Naora and me have led to the following conclusions: there is, in contrast to what happens to protein, no net synthesis of ribonucleic acid in these fragments. On further analysis, however, it is found that a true synthesis of chloroplastic ribonucleic acid occurs in pieces of anucleate *Acetabularia*; this synthesis apparently takes place at the expense of the other cytoplasmic ribonucleic acid fractions (microsomes, cell-sap), which decrease after enucleation. We thus arrive at the following conclusions: chloroplasts show a high degree of independence towards the nucleus and can apparently multiply in its absence; microsomal and soluble ribonucleic acids, in *Acetabularia* as well as in *Amoeba*, lie under much closer nuclear control.

There is good reason for believing that, in *Acetabularia* as in *Amoeba*, part of the cytoplasmic ribonucleic acid is of nuclear origin: incorporation of ribonucleic acid precursors is extremely active in the nucleolus[18] and treatment of the anucleate halves with inhibitors of ribonucleic acid synthesis (ribonuclease, for example[25]) leads to an irreversible loss of regenerating capacity; a similar treatment of nucleate halves produces only a temporary inhibition of regeneration; these facts strongly suggest that the morphogenetic processes, in anucleate fragments, are mediated by ribonucleic acid of nuclear origin. It should, however, be emphasized that anucleate pieces incorporate radioactive precursors into their ribonucleic acid at an almost normal level for many weeks[22,23]: there is thus no doubt that, in this alga, pure cytoplasm is capable of extensive and independent synthesis or turnover of ribonucleic acid.

Regarding finally the expression of the gene-determined morphogenetic character (cap formation) in anucleate fragments, it is interesting to note that it can be easily controlled by modifying the SH—SS equilibrium of the culture medium[23]: by adding —SH-containing substances (β-mercaptoethanol for example), cap formation is completely suppressed. In the presence of its oxidized (—SS-containing) counterpart, dithiodiglycol, caps form earlier and develop faster than in the controls. In other words, the genetic information which the cytoplasm has received from the nucleus (through ribonucleic acid of nuclear origin presumably) is 'forgotten' in the presence of mercaptoethanol and expresses itself better than normally when cytoplasmic —SH groups are oxidized.

Before we close the *Acetabularia* chapter, a last remark should be made: it would be a mistake to believe that nucleo-cytoplasmic interactions always correspond to nuclear control exerted on the cytoplasm; in this alga, a decrease in cytoplasmic energy production, by prolonged cultivation in the absence of light, for example, has far-reaching consequences on both the structure and the ribonucleic acid content of the nucleus and, especially, the nucleolus[16].

The experiments which have been performed on enucleate egg cells and on reticulocytes (see ref. 18 for a more complete review) are in substantial agreement with all that has been said about *Acetabularia*: removal of the nucleus in sea urchin or unfertilized eggs of the newt has no immediate effects on the incorporation of various precursors into ribonucleic acid and proteins; in reticulocytes, the loss of the nucleus is followed by a parallel drop in the ribonucleic acid content and the ability of the cell to incorporate amino-acids into proteins. Nevertheless, synthesis of various enzymes and even of hæmoglobin (the synthesis of which is very clearly genetically controlled) has been reported to occur in these anucleate cells: if this is true, it would be another piece of evidence for the view that genetically controlled synthesis of specific proteins can occur in the complete absence of the genes; here again, one could speculate that cytoplasmic ribonucleic acid of nuclear origin is the carrier of the genetic information.

Work on Homogenates

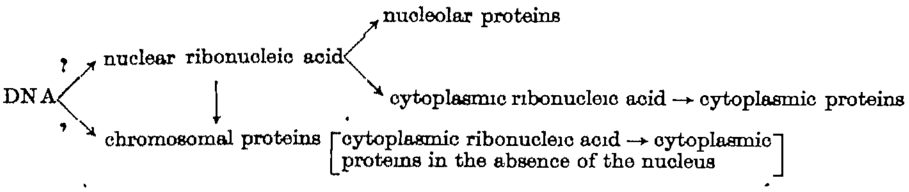
A few words should be said, finally, about the results obtained by biochemists who have been working on fractions recovered by differential centrifugation of homogenates (cf. ref. 18); it has been repeatedly shown, by this method, that the incorporation of ribonucleic acid precursors is always higher in nuclei than in any cytoplasmic fraction; similar experiments made with labelled amino-acids failed to demonstrate a particularly high ability of the nuclei for synthesizing proteins. Thus, we find once more that the nucleus is more directly involved in ribonucleic acid synthesis than in protein synthesis. Mention should be made, in this respect, of the very interesting experiments carried by Allfrey and Mirsky[27] on isolated thymus nuclei: the latter are capable of protein synthesis, and whole deoxyribonucleic acid is required in order to allow them to carry on this process. However, this role of deoxyribonucleic acid is an indirect one, since deoxyribonucleic acid is mainly concerned with energy production in the isolated nuclei. Furthermore, the experiments of Allfrey and Mirsky[27] clearly show that the ribonucleic acid synthesis is a necessary initial step before the isolated nuclei can incorporate amino-acids into their proteins.

General Conclusions

If we compare biological systems so different from each other as *Amoebae*, algae, eggs and reticulocytes, we find big quantitative differences; but they probably are just the result of a secondary factor, namely, the level of energy production in the anucleate cytoplasm. It is not surprising that an anucleate fragment of *Amoeba*, which is unable to feed, cannot be the site of a net protein synthesis; the situation is of course much better for *Acetabularia* (which is capable of active and normal photosynthesis in the absence of the nucleus), for eggs which are full of glycogen, fat and protein reserves, and for reticulocytes which live in such a rich nutrient medium as the blood stream.

Granting these easily understandable quantitative differences, there is no doubt that all the experiments made so far point toward the same general conclusion: the cell nucleus is the main site of synthesis of nucleic acids (deoxy- and ribonucleic acids). Its role in protein synthesis is a less direct one: it apparently controls the synthesis of cytoplasmic protein through the production of nuclear ribonucleic acid. The latter must, ultimately, receive the genetic information from deoxyribonucleic acid; but there is no evidence so far that 'deoxyribonucleic acid makes ribonucleic acid'. Nor is there any experimental evidence for the view that deoxyribonucleic acid could directly 'make' proteins, even chromosomal proteins. Finally, it should not be forgotten that, in the case of *Acetabularia*, independent synthesis of protein and ribonucleic acid (in the chloroplasts at least) is possible in the complete absence of the nucleus and, therefore, of genes and deoxyribonucleic acid.

For these reasons, the common 'slogan': DNA makes RNA, and RNA makes protein, is, in my opinion, an over-simplification which may prove dangerous. The following scheme, although still certainly very simple, is probably somewhat closer to the truth:



DNA
?
nuclear ribonucleic acid
nucleolar proteins
cytoplasmic ribonucleic acid → cytoplasmic proteins
?
chromosomal proteins
cytoplasmic ribonucleic acid → cytoplasmic proteins in the absence of the nucleus

It will be a task for the future to remove the question marks and to increase the number of the arrows present in this still largely hypothetical scheme.

THE AGADIR EARTHQUAKE OF FEBRUARY 29

By ERNEST TILLOTSON

THREE slight earth tremors during the previous week were not considered premonitory of the earthquake which suddenly occurred near Agadir at about 11.40 p.m. on the night of February 29, 1960, since this district had not previously experienced an earthquake of intensity 10 on the ten-degree scale. However, at 23h. 40m. 12s. U.T., after preliminary rumbling, the shock occurred. 90 per cent of the Talborjit quarter where many Moroccans lived in multi-storied apartment buildings, 70 per cent of the new buildings, including the Saada Hotel, built only five years ago, and the Gautier Hotel, and 20 per cent of the industrial buildings collapsed. Agadir, the tourist and economic capital of southern Morocco, where the Atlas Mountains descend to the Atlantic Ocean, was ruined. Some 12,000 people, including 3,000 foreigners, were estimated to have lost their lives, and many thousands besides were injured. A seismic sea wave (tsunami) which reached some 300 yards inland from the coast and then retreated, added to the damage.

There was no electric supply and there were no telephones; sporadic fires occurred as the fires in buildings were scattered about; the sanitary and water systems were utterly destroyed. The headquarters building for the militia collapsed with loss of life, but the police headquarters remained standing. Moreover, there were only a few police in the buildings during this night of Ramadan. An orphanage for about a hundred children was shattered; the hospital was badly damaged, and the maternity ward destroyed. Sailors from the French naval air base some 2½ miles away were quickly on the scene, and their prompt action saved thousands trapped under the ruins.

The ancient Casbah, inhabited by some 500 people, built about the year 1540 on high hills above the port, was destroyed. The shock was felt strongly in Mogador, about 100 miles to the north.

King Mohammed put his son, the Crown Prince Moulay Hassan, in charge of all necessary operations. Total evacuation of the population was ordered, the dead buried, and rescue operations for those trapped were continued. The injured were evacuated to hospitals in other parts of Morocco, and tented camps were erected, a large one being between Agadir and the Moorish town of Inezgane, 7 miles south-east of Agadir, which itself suffered some 30 per cent damage. Many buildings left unstable by the earthquake have been demolished and, since epidemics, especially of typhoid and plague, were feared, a 5-week quarantine was ordered. The ground has been spread where necessary with quicklime and 800 tons of DDT have been sprayed on the area.

At the port of Agadir all cranes collapsed with the falling-in of the quays and jetties, except on the main jetty. The principal cargo sheds were damaged, the harbourmaster killed and both pilots injured.

Evidence of a tremendous submarine upheaval off the coast was obtained from preliminary naval soundings. In one case the depth of water was found to be 45 ft. where previously it was charted at 1,200 ft. In a position about 9 miles from the shore, soundings showed a depth of 1,200 ft. instead of the charted 4,500 ft. An extensive hydrographic survey will thus be required, especially near the harbour, where some dredging was necessary even before the earthquake.

The shock was registered by seismographs at observatories throughout the world (Durham University Observatory, England, *iPz* 23h. 45m. 44s. *D*, *iSE* 23h. 50m. 21s. U.T.), and the United States Coast and Geodetic Survey placed the preliminary epicentre at lat. 30° N., long. 9° W. Small aftershocks have continued to occur, one at about 22·30h. on March 3, one about 00·01h. on March 4, two on March 5 and one on March 6.

The Times reported "an informed source" as stating that the insurance coverage in London for Agadir was expected to be a good deal short of one million pounds, "as North Africa is not regarded as a dangerous area for earthquakes" and as Agadir is basically under French influence and dealt with by French insurance companies. However, any rebuilding which may be undertaken at or near the present site of Agadir must now take earthquake risk into account. Earthquake damage at a given place depends on the properties of the elastic waves arriving there, on the ground at the site shaken, and on the structures involved. The ratio of amplitudes at sites on fairly dry alluvium more than 500 ft. deep to those at sites on crystalline rock is frequently 5 : 1, or more for earthquake waves of period 1–1¼ sec. For waves of period about 0·1 sec. and for waves having periods exceeding 10 sec. (length more than 10 miles) the differences in amplitude are small. Amplitudes of earthquake waves at sites on water-saturated soft ground may be ten times those on crystalline rock. The period of waves giving the maximum ratio decreases to a quarter of a second for places with alluvium about 100 ft. thick. Moreover, at sites on alluvium the length of time of shaking also increases. Ground effects may produce these appreciable differences in duration and amplitude even at localities only a fraction of a mile apart. The importance of choosing crystalline rock or at least dry ground, and of avoiding water-saturated soft ground for foundations of buildings in order to reduce potential earthquake damage, cannot be overemphasized.

OBITUARIES

Dr. W. F. P. McLintock, C.B.

William Francis Porter McLintock, formerly director of the Geological Survey of Great Britain, was born in Edinburgh on February 2, 1887, and was educated at George Heriot's School and the University of Edinburgh. He graduated in 1907, with special distinction in botany, in a remarkable science class of a dozen students which yielded two directors of Geological Surveys (Heron of India was the other), two principals and one professor in Dominion universities, and two heads of departments in the Indian Civil Service.

Following a Civil Service examination in mineralogy, McLintock was appointed assistant curator in the Museum of Practical Geology. Four years later, in 1911, he was promoted to take charge of the geological galleries of the Royal Scottish Museum; and when the Geological Survey and Museum was reorganized in 1920 under the directorship of (Sir) John S. Flett, he returned with Flett from Edinburgh to London, this time as curator. The Museum and Library at 28 Jermyn Street, built in 1851, had long been a reference centre for economic geologists and mining engineers, and a rapid growth of the collections there reflected McLintock's ever-helpful advice to the many that sought it.

In 1927, the Royal Commission on Government Museums recommended the transference of the Museum of Practical Geology to South Kensington, and under Flett's direction McLintock spent the following years in planning the new Museum. His clear-cut and revolutionary ideas on the need for a popularization of geology found small support in a tour of European institutions and met with little encouragement in some academic quarters at home; but a happy co-operation with H.M. Office of Works enabled him to achieve his ideals when the Geological Museum was opened to the public in 1935, at the centenary of the Geological Survey. Nothing in recent years has done more to promote the study of geology in Britain. From an attendance of 18,000 a year in Jermyn Street, the annual number of visitors soon soared to more than 250,000 and to-day exceeds 300,000.

When war came, the Museum was taken over as headquarters of the London Civil Defence Regional Organization, and the collections and library were in part dispersed to the country. McLintock, then deputy director of the Geological Survey, became responsible for the administration of the Survey's war effort, initiating departments dealing with raw materials for atomic energy, exploration geophysics, underground storage of petroleum, and other strategic fields. By 1945, when he succeeded as director, he had plans fully prepared to meet the heavy tasks of re-organizing the Survey on a much-expanded peacetime programme and rapidly restoring the Museum to public service. On completion of this work he resigned in October 1950.

McLintock's publications include a variety of papers on Cornish and Devon minerals, and on the zeolites of Mull; a model account of the Strathmore meteorite, the flight of which he himself observed from an Edinburgh street and which he acquired for the national collections the next morning: a guide to the Geological Museum's collection of gemstones, now in its third edition; and a petrographical study of unusual pseudo-igneous rocks collected by him in Persia, which were shown to be sediments fused in the combustion of oil and gas seepages long since extinguished. In a long and fruitful collaboration with Dr. J. Phemister, he organized and carried out pioneer gravitational and magnetic surveys at many localities in Britain, to demonstrate the usefulness of geophysical methods in geological exploration.

Many will recall the brilliance and pungency of his conversation, the precision of his long memory, the independence of his judgment, and the sharpness with which he devastated all that was hollow and unsound; but perhaps those colleagues who shared with him the long night watches in war-time London appreciated best his unswerving loyalty to the Geological Survey and unselfish devotion to the interests of its staff. He died suddenly in Edinburgh on February 21, following a happy decade of retirement, with his wife, in the Perthshire countryside.

C. F. Davidson

Prof. S. A. Mitchell

Prof. Samuel Alfred Mitchell, formerly director of the Leander McCormick Observatory, died in his eighty-sixth year at Bloomington, Indiana, on February 22. Born at Kingston, Ontario, he graduated at Queen's University, Kingston, in 1894, took a degree at Johns Hopkins University and became instructor and professor of astronomy at Columbia University. In 1912, he was appointed director of the Leander McCormick Observatory, Virginia, a post that he held until his retirement in 1945.

His chief work there was the determination of stellar parallaxes by photographic methods. He was a member of the Commission on Stellar Parallaxes of the International Astronomical Union from its foundation and followed Schlesinger as chairman of the Commission in 1928. He was also a member of the Commissions on Variable Stars, Solar Physics and Solar Eclipses. He was chairman of the last-named Commission from 1935 until 1950 and remained a member of it until 1958.

It is for his work on eclipses and on his speciality throughout, the chromospheric spectrum, that Mitchell will be best remembered. He went on ten eclipse expeditions—four in the United States and one each in Sumatra, Spain, Norway, Niauafoou (or Tin-can Island), Canton Island and Canada; in only three cases were the eclipse observations entirely spoilt by clouds—California in 1923, Norway in 1927 and Canada in 1932. Probably he saw the corona on more occasions than any one else. His book "Eclipses of the Sun" gives an account of his experiences.

Mitchell received the Watson Gold Medal of the U.S. National Academy of Sciences and was elected an associate of the Royal Astronomical Society in 1933, shortly after he had become qualified by naturalization as a citizen of the United States.

Thereto hangs an amusing story. When he married he was still a Canadian, and according to the law of the United States at that time his wife became a Canadian. Later he became naturalized as an American citizen, but the law had meanwhile been altered and the wife's nationality no longer followed her husband's; Mrs. Mitchell remained a Canadian under United States law but became American under British law. Later, wishing to visit her son, who was studying in England, she had to be naturalized as an American citizen in order to get a passport to come to England! F. J. M. STRATTON

Dr. George A. Edwards

GEORGE A. EDWARDS, associate research scientist in micromorphology, at the Division of Laboratories and Research, New York State Department of Health, died in Albany on March 1, at the age of forty-six. Dr. Edwards was a graduate of Tufts University 1939, and received his Ph.D. in biology from Harvard University, 1947. Prior to going to the New York State Department of Health in 1956, Dr. Edwards had been professor of general physiology, co-ordinator of research, and co-founder of the Marine Biological Laboratory, University of São Paulo, Brazil, from 1952; he was a corresponding member of the Brazilian Academy of Sciences.

In the Second World War, Dr. Edwards was aviation physiologist attached to the Air Force in the development of equipment for high-altitude flying and survival techniques for air-sea rescue. Dr. Edwards did extensive research on nerve and muscle physiology, pharmacology, and morphology. His recent publications in electron microscopy included also studies of the ultra-structure of several dimorphic pathogenic fungi and the micromorphology of human bronchogenic carcinomas.

NEWS and VIEWS

Physics at Liverpool: Prof. J. M. Cassels, F.R.S.

PROF. J. M. CASSELS has been appointed to the Lyon Jones chair of physics at the University of Liverpool in succession to Prof. H. W. B. Skinner, who died in January. Prof. Cassels was educated at Rochester House School, Edinburgh, St. Lawrence College, Ramsgate, and Trinity College, Cambridge. Although best known for his many contributions to high-energy physics, his earliest work was performed at the opposite extreme of the energy-scale in nuclear physics when he carried out an elegant and painstaking research in the scattering of very slow neutrons by solids, using the Cavendish Laboratory cyclotron in collaboration with R. Latham. His introduction to high-energy physics was at the Atomic Energy Research Establishment, Harwell, where he worked with the 175-MeV. protons of the synchrocyclotron between 1949 and 1953, producing many papers on nucleon-nucleon scattering and high-energy nuclear interactions. From there he moved to the bigger synchrocyclotron at Liverpool, first as a lecturer and in 1956 as professor of experimental physics. His main research interests were now in pion physics, and he built up a strong group working in this field. He was elected to the Royal Society at the early age of thirty-four. In 1959 he took an appointment at Cornell University with R. R. Wilson, where he has been using the 1·2-GeV. electron synchrotron in electron scattering experiments. He was closely associated with CERN during its earliest days, and has maintained close contacts with high-energy physics at the Atomic Energy Research Establishment and the Rutherford Laboratory.

Metallurgy at Leeds: Prof. J. Nutting

PROF. J. NUTTING, who succeeds Prof. N. J. Petch (see *Nature*, 183, 1643; 1959) in the chair of metallurgy in the University of Leeds, was educated at Mirfield Grammar School, Yorkshire (1935–42), and then at the Department of Metallurgy, University of Leeds (1942–45), where he was awarded the degree of B.Sc. with first-class honours in metallurgy. During the period 1945–48 he worked under the late Prof. Preece on the overheating and burning of steel and was awarded the degree of Ph.D. in 1948. He then went to Cambridge and worked for one year in the Cavendish Laboratory as a scientific officer for the British Iron and Steel Research Association and there joined with Dr. V. E. Cosslett and Prof. E. Orowan on the development of techniques for applying the electron microscope to metallurgical problems. In 1949 he became a demonstrator, and in 1954 a University lecturer, in the Department of Metallurgy, University of Cambridge. For the past twelve years he has worked on problems of phase changes in both ferrous and non-ferrous alloys and on the relation between phase changes and mechanical properties of alloys. He has been particularly interested in electron microscopy and its application to these problems of alloys. He has travelled and lectured widely at scientific conferences and in 1951 was awarded a Nuffield travelling fellowship to visit Canada and the United States.

A New British Computer

ON April 6 there was demonstrated in London the first commercially built British digital differential analyser. This machine, the *Corsair*, has been produced as the result of the joint activities of the Royal Aircraft Establishment, Farnborough, and Semiconductors, Ltd. The differential analyser as such is an old device, but the use of digital circuits to perform the operation of integration has infused it with new life and accuracy. The main attraction of a differential analyser, considered as an analogue device, is that it performs continuous operations such as integration at a much higher rate than is possible with a programmed digital computer. Analogue computing elements are, however, inaccurate, and it is difficult to attain precisions of more than about 1 per cent. The digital differential analyser overcomes this trouble by reducing the integration to digital summation, because this can be performed simply and at very high speed. In digital circuits accuracy is no problem, so that the *Corsair* is able to attain an accuracy of better than 0·01 per cent, which quite outclasses purely analogue devices.

The new computer uses about 2,000 transistors of which nearly 700 are of the surface barrier type, the characteristics of which permit the direct current connexion of various elements with consequent saving of complexity and space. The machine has the rather large number of 50 integrators, which gives it great power and versatility, its physical size is quite small—about 20 c. ft.—and its appearance is attractive and neat. When it is produced in quantity, it should prove an invaluable research tool in universities, colleges of technology and in industry. It is pleasant to see that Britain has now entered this important new field.

Imperial Chemical Industries, Ltd.

A NEW ammonia plant, with a capacity of 100,000 tons a year, and associated plants to make urea and fertilizers is to be built at Imperial Chemical Industries, Ltd., Severnside Works in south Gloucestershire, at a cost of upwards of £10 millions. This plant is expected to start production during 1963. This is the second important project that Imperial Chemical Industries has decided to construct on the new 1,000-acre Severnside site. The first, announced in February, will involve the construction of plants to make ethylene oxide and ethylene glycol, costing £5 millions. Imperial Chemical Industries has also decided to extend the methanol plant at its Heysham Works in Lancashire. A new plant to make 30,000 tons a year began production there only a few months ago. A further extension to make an additional 45,000 tons a year is now to be built, and is expected to be completed during 1962. Methanol is an important raw material for the plastics industry.

Scientific and Technical Services in Rhodesia and Nyasaland

A LIST has recently been published of government and statutory bodies concerned with scientific research and technical services in the Federation of Rhodesia and Nyasaland, giving in brief the history, functions, organization, location and establishment of each (Government Organizations and Statutory Bodies concerned with Scientific Research and Technical Services in the Federation of Rhodesia and Nyasaland, 1959. Pp. 80. Salisbury: Office of the Federal Prime Minister and External Affairs, 1959). Research within the Federation is treated as a "concurrent subject", that is to say, that both the Federal and Territorial Governments have power to legislate in this field. The Federal Government obtained the services of Mr. D. G. Kingwell, of the South African Council for Scientific and Industrial Research, to report on the development of science in the Federation. Mr. Kingwell's recommendations have been adopted, and a Research Act has been brought into operation which is designed to promote scientific and industrial research, including agricultural, veterinary and tsetse research, to establish a research foundation and to provide for the establishment of research councils.

Organization of Medical Care

A REPORT by a World Health Organization Committee on medical care embodies the opinion of a group of experts from several countries, representing public health administration, hospital administration, medical practice, health insurance and voluntary agencies, on measures for "the organization and co-ordination of comprehensive preventive and curative medical care services provided to the individual outside the hospital wards" (World Health Organization. Technical Report Series No. 176: Role of Hospitals in Ambulatory and Domiciliary Medical Care—Second Report of the Expert Committee on Organization of Medical Care. Pp. 32. (Geneva: World Health Organization; London: H.M. Stationery Office, 1959.) 1 Swiss franc; 1*s*. 9*d*.; 0·30 dollar.) The scope of such services is considered to cover ambulatory care in out-patient departments, domiciliary care, after-care and medical rehabilitation. While recognizing that the degree of co-ordination possible will depend on national or local conditions, the Committee considers that the establishment of a central authority with planning and advisory powers would facilitate the rational siting of services and maintain the standards of both the care given and the equipment available. The main out-patient services which would be expected to contribute to a programme of ambulatory and domiciliary medical care are defined, and their functions indicated. They are: dispensaries, polyclinics, out-patient departments, health centres, medical practitioners, industrial medical services, medical rehabilitation centres, and intermediate institutions such as day-hospitals and night hostels. It is emphasized that continuity of care is of the utmost importance; this involves provision for an easy transition from domiciliary and ambulatory to hospital care, and back to the physician first concerned with the case.

The National Research Development Corporation of India

THE fifth annual report and statement of accounts of the National Research Development Corporation of India covers the period ending March 31, 1959, and records sustained progress (pp. 23. New Delhi: National Research Development Corporation of India, 1959). Commercial production from several patents and processes licensed in previous years has already commenced and twenty-four licences were negotiated compared with seventeen in the previous year, and five processes went into production. Development expenditure on projects already sanctioned amounted to Rs. 3.91 lakhs, and gross income from premiums and royalties increased to Rs. 1.66 lakhs. Marketing of 'Hykol' brand activated carbons produced at the Regional Research Laboratory, Hyderabad, commenced, and mica insulating bricks and carbons produced by Corporation licencees have been used in the Bhilai steel plant. During the year 56 inventions were reported for development by 20 research institutions, bringing the total of reported inventions to 503. Projects for the refining of cotton seed oil and the production of copper chlorophyll from indigenous raw materials were completed, and progress is reported in the projects for phthalic anhydride, de-ionization of cane juice, white cement from feldspar, and the fluidized-bed technique for textile processing.

Inventory of Economic Studies in Africa

THE Commission for Technical Co-operation in Africa South of the Sahara has issued an annotated reading list of books, articles and official publications since 1945 dealing with economics in Africa (CSA/CCTA Publication No. 30; Joint Project No. 4: Inventory of Economic Studies concerning Africa South of the Sahara—an Annotated Reading List of Books, Articles and Official Publications. Pp. xi+301. (London: Commission for Technical Co-operation in Africa South of the Sahara, 1960)). The inventory, which has been edited by Miss Peter Ady on the basis of information collected by a panel of national correspondents in economics, is the outcome of the adoption by the Commission in 1957 of the recommendation of a Specialist Committee in Economics. Its 1,377 entries are confined almost entirely to publications dealing specifically with African regions or countries, but it has proved unusually difficult to draw the line between economics and anthropology and between political economy and politics. The entries are arranged alphabetically by author, first, geographically, under Africa General; Belgian Congo; French Republic and Community; Portuguese Africa; Spanish Africa; British Africa; Ghana, Central Africa; and South Africa. Within these sections the entries are classified by subject and there is an author index. Entries and annotations are in English and French.

Museum and Art Gallery, Durban

THE annual report of the Durban Museum and Art Gallery for the municipal year 1958–59 records that curatorial work has mainly centred on the new Marine Hall (pp. 19. Durban: Durban Museum and Art Gallery, 1959). The exhibits of sharks, rays, skates, turtle and Cape sealion have been installed and work on a large exhibit of the major game fishes of the Natal coast is nearly complete. After many experiments plastic has been used to good effect in these recent marine displays. The output of research work on the collections by the staff remains at a high level. Display and storage accommodation at the Old House Museum (which serves as a branch Folk Museum) is now so limited that serious consideration must be given in the relatively near future to the provision of an additional building, either as a separate entity in the grounds or as a wing of the Old House.

Field Studies Council

MEASURED by the quality of the courses conducted, the number of students attending the centres, and the financial outcome of the year's operation, the report of the Field Studies Council for 1958–59 is again one of continued progress. (Pp. 34+4 plates. London: Field Studies Council, 1960.) Over the past nine years the total number of bookings at the Centres has risen from 3,483 to 7,903. Of these, more than half were students of biological subjects, and more than a quarter of geographical and geological subjects. A surprising number of those attending took courses in art and archæology. Well over half the students attending were from grammar schools but, regrettably, the numbers attending from secondary modern schools remained very small; this is a matter to which education authorities should be asked to pay closer attention. Because of the establishment of a new centre at Slapton Ley, the Ministry of Education generously agreed not to carry out its declared intention progressively to reduce the £5,000 annual grant. The reduction will now begin next year and will not lead to much embarrassment. Further information concerning the work of the Council can be obtained from Mrs. F. H. C. Butler, Ravensmead, Keston, Kent.

Reference Books on Mineralogy in the U.S.S.R.

THE Academy of Sciences of the U.S.S.R. is planning to publish in 1959–65 a collection of reference books on mineralogy. The subjects covered by the projected volumes are as follows: Vol. 1, introduction, native elements, intermetallic compounds, arsenides and antimonides, sulphides; Vol. 2, haloids; Vol. 3, silicates (part 1); Vol. 4, silicates (part 2); Vol. 5, niobates and tantalates, carbonates, nitrates, borates, sulphates; Vol. 6, phosphates, arsenates and vanadates, tungstates, molybdates, etc.; Vol. 7, diagrams illustrating phase equilibria important in mineralogy. The size of each volume is estimated to be 500 pages and the price 38–40 roubles. This collection of reference books will be prepared under the auspices of the Institute of the Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry, and of the Mineralogical Museum of the Academy of Sciences.

Scientific Bibliography of Latin America

THE Conference of Latin American Scientific Experts convened by the United Nations Educational, Scientific and Cultural Organization at Montevideo in September 1948 requested the preparation of a Latin American biobibliography (Unesco: Centro de Cooperacion Cientifica para America Latina. Scientific Institutions and Scientists in Latin-America. Paraguay (1er Volumen). Pp. ii+93. Chile (2° Volumen). Pp. ii+40. Montevideo: Unesco, Centro de Cooperacion Cientifica para America Latina, 1959). The preparation of this was undertaken by Unesco's Field Science Co-operation Office for Latin America in collaboration with Ibero-American organizations, and Vol. 1 contains a first list of Paraguayan scientists and scientific organizations. Scientists are listed alphabetically, with particulars of their qualifications and experience and publications. Vol. 2 gives similar data for institutions and scientists in Chile.

Ionosphere over Belgium during the International Geophysical Year

THE Royal Meteorological Institute of Belgium has been publishing monthly bulletins of the ionospheric observations taken at the station of Dourbres (lat. 50° 06′ N., long. 04° 36′ E.) during the International Geophysical Year (Royal Meteorological Institute of Belgium, Avenue Circulaire, 3, Uccle, Brussels, 18). An automatic ionosonde of the U.S. National Bureau of Standards type *C*–2 was used; this sweeps over the range of frequencies from 1 to 25 Mc./s. in 30 sec., emitting 30 pulses per sec. of 50 μsec. duration. The peak power transmitted is about 10 kW., from one of two vertical rhombic aerials used for the lower and upper parts of this frequency range (1–4 and 4–25 Mc./sec.). On normal days, soundings are made at about fifteen-minute intervals; but during the Regular World Days and Special World Intervals of the International Geophysical Year, soundings were made every five minutes.

The bulletins of Ionospheric Observations taken during July–October 1958, inclusive, have recently been issued. These are similar in form to those issued for the preceding months of the International Geophysical Year; and contain graphs of the median monthly values of the heights and critical frequencies of the E, $F1$ and $F2$ regions, and also curves showing the percentage of the total time during which the critical frequency of the sporadic Es layer exceeded the limiting values of 3, 5 and 7 Mc./sec. In addition to these graphs, the individual hourly observed values are given for the $F2$, $F1$, E and Es layers. Additional tables give the maximum usable frequencies for radio transmission over a distance of 3,000 km. by the $F2$ and $F1$ layers, and other values relating to the height and critical frequency of the sporadic E region. The symbols used throughout the bulletins conform with the decisions of the Union Radio-Scientifique Internationale/International Geophysical Year sub-committee on Ionospheric Soundings.

Modern Explosives

NUMBER 5 of the Royal Institute of Chemistry "Lectures, Monographs and Reports, 1959" covers the subject of modern explosives (by the late Dr. Wilfrid Taylor. Pp. 63. London: Royal Institute of Chemistry, 1959. 6*s*. net). It is a well-balanced review of modern chemical explosives, written by one of the most distinguished research workers on the subject who, until his death in 1958, was for many years in the Research Department of the Nobel Division of Imperial Chemical Industries, Ltd. It is an excellent introduction for the chemist, physicist or engineer, to the scientific basis of the development of chemical explosives. Dr. Taylor describes in succession the early history of the development of high explosives, the properties sought from explosives, the chemical composition of the more important individual explosives and of the various commercial mixtures developed from them to suit various requirements. He follows with sections on the physical phenomena of detonation (velocity of detonation, temperatures and pressures developed during detonation), and on the precise physical action of explosives in breaking rock and coal. Next is a brief but useful statement of the hydrodynamical theory of detonation, followed by a discussion of modern views of reaction mechanisms in detonation. A special section is devoted to coal-mining explosives, which have to reach the highest possible safety against the danger of ignition of firedamp and coal dust. The whole subject is condensed into sixty very readable pages, with a couple of pages of references carefully selected from among the thousands of original papers on the subject.

A Radiocarbon Dating System using Scintillation Techniques

A PROCEDURE for radiocarbon dating, based on the use of scintillation techniques, is described by C. F. G. Delaney and I. R. McAulay (*Sci. Proc. Roy. Dublin Soc.*, A, 1, No. 1; 1959. 4*s*.). The method involves the conversion of the sample into methyl alcohol, which is then mixed with a liquid scintillator and its radiocarbon activity measured, in a quartz cell, using an arrangement of two photomultipliers in coincidence. The overall yield in the chemical preparation is about 45 per cent, and the purity of the methyl alcohol is checked by gas-phase chromatography. The background counting-rate is reduced by the use of massive screening combined with the application of the technique of pulse-height selection to the outputs of the photomultipliers. In this way, a background of 13·6 c.p.m. is obtained, and the net counting-rate for contemporary material is 20·6 c.p.m. above this value. Thus, when using a counting period of 17 hr., results of significance to 30,000 years are obtainable. The weight of sample required (equivalent to about 15 gm. carbon) is rather large compared with the requirements of most of the methods in current use, nearly all of which are based on proportional gas-counting techniques. However, this method, unlike those based in gas counting, has the advantage that it is not dependent on supplies of liquid air (which is not readily available in Dublin). Moreover, the preparative chemistry is relatively simple, and less steel screening is required than is necessary in most arrangements using proportional counters. The initial dating programme was concerned with the dating of vegetational changes detected by pollen analysis in a peat column from Redbog, Co. Louth, and the results of these measurements are presented.

X-Ray Studies of Some Carbonized Coals

IN a recent paper, R. Diamond has described a notable advance in the X-ray study of carbonaceous materials (*Phil. Trans. Roy. Soc.*, 252, 193; 1959). The paper reviews the author's detailed work with P. B. Hirsch on the X-ray examination of a range of coals carbonized up to 1,000° C., and brings together the analysis of variations in aromatic layer size distribution, mean C—C bond-length and molecular packing in a consistent model of the carbonization process. The approach to the problem of aromatic layer size distribution is particularly interesting not only because it is the first attempt of this kind, but also because of the elegance of the method. The author uses matrix methods in fitting a linear combination of theoretical intensity functions for graphitic layers of various size-groups to the observed X-ray intensities with the minimum total square error. The results are given as histograms showing the percentages by weight of material associated with each size-group. It would seem that this 'resolution' is approaching the limit attainable by X-ray analysis of these complex disordered materials. This is brought out in Diamond's careful discussion of the significance of layer diameter measurements when the structural model is modified to include edge groupings and departures of the aromatic layers from a truly graphitic structure. The structural chemist will want to know more about the nature of the aromatic systems as well as other features which X-ray analysis cannot elucidate, but the facts brought to light in this work should appreciably limit the range for conjecture in a field where it has inevitably been wide.

Culture of Salmon and Trout

IN many parts of North America, the culture of trout and salmon is carried out on a large scale, and a bulletin recently issued by the Department of Fish and Game for the State of California deals briefly with many aspects of hatchery practice (No. 107: Trout and Salmon Culture—(Hatchery Methods). By Earl Leitritz. Pp. 169. Sacramento: Printing Division, Department of Fish and Game, 1959. 2 dollars). The sections on feeding practices and the treatment of disease serve to illustrate how new methods and techniques have been introduced during the past ten or fifteen years. Comprehensive feeding schedules have been developed from actual production records, and in this way the fish are adequately fed with a minimum of waste and the minimum amount of labour. Various anæsthetics have been employed as an aid in tagging, taking of spawn and the transportation of fish. Until recently, urethane (ethyl carbonate) was perhaps the most common anæsthetic used in fishery work. However, tests with mammals have shown that this substance could be carcinogenic after prolonged and repeated exposures. Because of this risk to fishery workers, urethane is no longer used as a fish anæsthetic in California. As an alternative, *MS* 222 (tricaine methane sulphonate) is in common use both in the United States and Europe.

This book was prepared at the request of many of the Department's fish hatchery personnel, and naturally it is concerned mainly with the culture of rainbow trout and certain species of Pacific salmon. However, it contains much useful data and practical information, and would serve as a handy reference for anyone concerned with the rearing and care of salmonids in Britain.

Late Precambrian Fauna in South Australia

In 1947, R. C. Sprigg first described fossilized soft-bodied animals in what were then believed to be lower Cambrian quartzites near the Ediacara mining area, some 380 road miles north of Adelaide, South Australia. In view of its scientific importance, the area was proclaimed a fossil reserve in May 1958, under the control of the Minister of Education and the authorities of the South Australian Museum. In October 1958, M. F. Glaessner and B. Daily visited the area; they have now described its geology and remarkable fauna (*Rec. South Austral. Mus.*, 13; July 1959). It is estimated that eight hundred fossil specimens have been collected from near the top of the Pound Quartzite at Ediacara. Work on this material is not complete; but it is now thought that the fauna consists not only of medusæ believed to represent the Scyphozoa and Hydrozoa, but also Anthozoa (Octacorallia), Annelida, and at least two entirely new types of invertebrates. One or more elements of this fauna show relations with the fauna of the Nama System of South Africa, and one with *Charnia masoni* Ford from Charnwood Forest, England. Glaessner suggests that stratigraphic and palæontological evidence supports the placing of this fauna in the Late Precambrian rather than the Lower Cambrian. The fauna is marine, with both pelagic and benthonic elements, and the lithology suggests shallow water. All the forms appear to have been soft-bodied, and have been preserved as moulds and casts, almost entirely on the undersides of the flaggy quartzite beds.

Evidence of Concurrent Translocation

The problems of translocation in plants remain enigmatic and of perennial interest. In a recent investigation, evidence that different kinds of translocation take place concurrently has been obtained by C. D. Nelson, H. J. Perkins and P. R. Gorham (*Canadian J. Bot.*, 37, No. 6, 1181; 1959). The method used was to trace the pathway of photosynthetically assimilated carbon-14 in the soya bean. They found that when the primary leaf of a soya bean plant was allowed to carry on photosynthesis in labelled carbon dioxide, a small amount of labelled carbon was translocated downward into the root at a velocity of at least 5,040 cm. per hour. This velocity was fifty times greater than the velocity at which sucrose was translocated in the phloem. The rapidly translocated carbon-14 was not moved as carbon dioxide. When the time of translocation was increased from 30 sec. to 10 min. there was an increase in carbon-14 content of the root without any increase in carbon-14 content of the lowest part of the stem. Part of the carbon-14 was translocated through a steam-girdled stem, but under these conditions there was no accumulation in the root. This indicates that the rapid translocation of carbon-14 occurred in both living and dead tissues of the stem. These results were correlated with the localization of carbon-14 in tissue autoradiographs of cross-sections of the stem to show that there were at least three pathways of downward translocation: (*a*) a slow translocation in the phloem; (*b*) a rapid translocation in the xylem; and (*c*) a rapid translocation in either the cortex, the phloem, or the pith.

Grooved Rocks at Apoje, Nigeria

A report of some investigations on grooved rocks at Apoje, near Ijebu-Igbo, Western Nigeria, by William Fagg appeared in the December issue of *Man*. Only a few rocks were studied, but it would appear that there are many more in the region. The grooves, which are deep, wide and rounded, cannot be said to be anything in the way of figures, though circles and ellipses do occur. The problem naturally arises as to the age of these carvings and who made them. They do not recall other rock carvings described by H. Fosbrooke in *Man* during 1952, where it was shown that they were connected with initiation ceremonies. At the same time, these new finds are too carefully made to be merely the result of grinding and polishing stone tools. The modern inhabitants hold them in reverence, and this would suggest a certain antiquity and the probability that they were made by folk who preceded the ancestors of the present population. Maybe when other examples are discovered and studied the answer to these queries will become plain.

Australopithecine Tools

Bone tools at the Kalkbank Middle Stone Age site and the Matapansgat Australopithecine locality, Central Transvaal, are the subject of an article by Prof. R. A. Dart, Dr. Kitching and Revil J. Mason (*Arch. Bull.*, 13, No. 51; Sept. 1958). For some time, Prof. Dart has been studying what kind of bones very early man selected for possible tool-making purposes. Such a selective process would indicate some degree of intelligence. If it can be shown that even the Australopithecine used bone for simple tool-making, and selected certain kinds of bones and perhaps preferred certain animals, then a little more can be suggested as regards the intelligence of these lowly creatures.

Nematology at the Imperial College of Science and Technology

A new Nematology Laboratory for the Imperial College of Science and Technology, London, to be built and equipped at the College Field Station at Silwood Park, near Ascot, Berkshire, at a cost of £30,000, will be the first university laboratory in the Commonwealth specifically staffed and equipped for research and training in this subject at postgraduate level. Shell International Chemical Co. is contributing £15,000 towards the cost of building and equipping the Laboratory which, it is hoped, will be completed in time for the new academic year beginning next October. Under Prof. B. G. Peters, who was appointed to a new chair of parasitology in Imperial College in 1955 (see *Nature*, 176, 145; 1955), work on nematology has been developing, and a full-time one-year course in nematology was started in 1958.

Fritz London Award for Low-Temperature Research

Nominations for the second Fritz London International Award are being solicited from all low-temperature scientists by the selection committee for this award. The first award was made to Dr. Nicholas Kurti, of the Clarendon Laboratory, Oxford, at the fifth International Conference on Low-temperature Physics and Chemistry in Madison, Wisconsin, during August 1957. If a suitable candidate is found the award will be made at the seventh International

Conference on Low-temperature Physics to be held in Toronto during August 29–September 3. Further information can be obtained from Dr. F. G. Brickwedde, College of Chemistry and Physics, Pennsylvania State University, Pennsylvania.

The German Geological Association: Jubilee Meeting

THE Geologische Vereinigung held its jubilee meeting at Würzburg during March 12–14 and it was attended by more than four hundred geologists. The theme considered was orogens. Some thirty authors contributed, their papers being grouped under the headings: time and matter in orogenesis, and structure and distribution of orogens. In the first part the concept of geosynclines was discussed and the sedimentation, metamorphism and the part played by magma within them enlarged upon. In the second, special structures within mountain chains of five continents were described and the differences between those near, or on, the surface and those existing at depth were contrasted. The principal award of the Association, the Steinmann Medal, was made to Prof. H. H. Read, emeritus professor of geology in the University of London, for his outstanding contributions to geological science.

Helminthological Society of Washington Anniversary

THE Helminthological Society of Washington will observe its fiftieth anniversary on October 8. The scientific programme will be held in the University of Maryland, College Park, Maryland. A banquet will be held during the evening at the Naval Officers Club at Bethesda, Maryland. Dr. Chauncey D. Leake, president of the American Association for the Advancement of Science, will be the speaker at a banquet to be held on that day.

Wool Textile Research Conference

THE second Quinquennial Wool Textile Conference is to be held in the United Kingdom during May 18–28. The conference, the theme of which is "Fibre Science", is to be arranged by the U.K. Textile Institute and is to be held at Harrogate. Participants from other countries include: Australia, Belgium, Canada, Germany, Japan, Netherlands, New Zealand, Norway, South Africa, Sweden, Switzerland and the United States. Further details can be obtained from the Textile Institute, 10 Blackfriars Street, Manchester 3.

Summer Meeting of the Illuminating Engineering Society

THE Illuminating Engineering Society is holding its biennial summer meeting at Harrogate during May 15–18. Three papers will be presented: "Progress in the Field of Electric Lamps", by H. G. Jenkins (General Electric Co., Ltd.); "Rationally Recommended Illumination Levels", by H. C. Weston; "Plastics, Yesterday, To-day and Tomorrow", by C. L. Child (Imperial Chemical Industries, Ltd.). Further information can be obtained from the Secretary, Illuminating Engineering Society, 32 Victoria Street, London, S.W.1.

Announcements

H.M. THE QUEEN, who is Patron of the Royal Society, will open the tercentenary celebrations of the Society at a meeting in the Royal Albert Hall on the afternoon of July 19 (see *Nature*, March 26, p. 879).

DR. D. H. FOLLETT, keeper of the Department of Electrical Engineering and Communications in the Science Museum, South Kensington, has been appointed director of the Museum in succession to Dr. T. C. S. Morrison-Scott, who is succeeding Sir Gavin de Beer at the British Museum (Natural History) (see *Nature*, March 26, p. 888). Mr. D. Chilton has been appointed keeper of the Department of Electrical Engineering and Communications.

MR. R. C. PALMER, deputy director of research to Griffin and George, Ltd., and associated companies, has been appointed director of research in succession to Dr. A. J. P. Martin, who wishes to concentrate in future primarily on fundamental research. Mr. Palmer was on the staff of the Wool Industries Research Association, Leeds, during 1937–51, after which he was appointed director of research of the South African Wool Industrial Research Institute.

MR. LAWRENCE SUTTON, formerly director of studies at Ashridge College, has been appointed education officer to the Institution of Works Managers, 196 Shaftesbury Avenue, London, W.C.2. As such, he will collaborate with technical colleges running the Institution's two-year training course leading to the certificate in works management, of which more than a hundred were awarded in 1959.

APPLICATIONS are invited for the Bowles Memorial Travel Scholarship. The object of the Scholarship is to enable the holder to travel abroad for the purpose of either collecting plants for introduction to British gardens or studying practical horticulture in other countries. Applicants must be of the male sex, not more than twenty-eight years of age on January 1, 1961, and have some academic connexion with horticulture. Applications should reach the Secretary, Royal Horticultural Society, Vincent Square, London, S.W.1, by September 30.

UNDER the title "Postgraduate Courses 1960–61" the Imperial College of Science and Technology has issued a booklet giving particulars of postgraduate courses available leading to a degree or diploma and of shorter postgraduate courses (mainly lectures) for which, under appropriate conditions, certificates are also given (pp. xii + 113. London: Imperial College of Science and Technology (University of London), 1960). Many of the courses have been accepted by the Department of Scientific and Industrial Research as suitable for the tenure of Advanced Course Studentships, and grants for the courses in agricultural chemistry and nematology are awarded by the Ministry of Agriculture, Fisheries and Food.

THE seventh General Assembly of the International Union for Conservation of Nature and Natural Resources will be held during June 15–24 in Warsaw. The Assembly is to be held jointly with the eighth Technical Meeting; the final sessions will take place in Cracow. Further information can be obtained from the Secretariat of the International Union for Conservation of Nature, 31 rue Vautier, Brussels.

ERRATUM. In the communication entitled "Methods for the Evaluation of the Antibacterial Activity of Surface-Active Compounds" in *Nature* of April 9, p. 132, col. 2, line 47, for "fats" read "fate". The line now reads "The fate of micro-organisms in dishwater was investigated . . ."

THE CARNEGIE INSTITUTION OF WASHINGTON

THE report of the Carnegie Institution of Washington, covering the year ended June 30, 1959, includes the report of the President, those of Departments and Special Studies, to which bibliographies are appended, and the administrative reports*. In reviewing the work of the year, the President directs special attention to the work of the Geophysical Laboratory and the Department of Terrestrial Magnetism and particularly that concerned with the mechanism of formation, the age and composition of Earth minerals. Using special equipment designed to reproduce conditions of temperature and pressure occurring within the Earth's crust, studies of mineralogical changes at pressures up to 50,000 bars (equivalent to a depth of about 150 km.) have shown that orthopyroxene (a calcium–magnesium–iron silicate with manganese) and minerals rich in alumina common in crustal rocks will react under conditions of temperature and pressure found in the mantle to form the magnesian garnet, pyrope. Experimental petrological examinations have been made of pyroxenes, garnets, biotites, amphiboles, spinels and feldspars and investigations of nickel–sulphur binary, iron–arsenic–sulphur and nickel–arsenic–sulphur ternary systems completed. The theory of 'coloured space groups' within crystals was extended and the application of the extended theory to seven mineral compounds of the cubic type of crystal structure was studied. Chemical studies of the highly refractory substance kerogen have been directed at its mode of formation and structure, and pilot experiments indicated that glucose and glycine could be transformed to substances suggesting asphaltine or even kerogen, but of different solubility, by incubating mixtures of them at 100° C. and pH values within the range which might have obtained in sedimentary rocks at the time of kerogen formation.

The techniques of mineral dating by nuclear clocks have been further extended and the ages of two or more co-existing phases in single rocks determined. Work on rocks in the Appalachian complex indicates that major geological events separated by very long intervening periods may be recorded by different minerals in the same rock. Further evidence has been obtained on questions of mountain building and it is now planned to make use of local earthquakes for crustal studies. The first station of a local network for detecting seismic disturbances planned for Peru, Bolivia and Chile was installed near Arequipa during the year. These stations will be equipped with electronically operated seismic recorders requiring the minimum of attention. A study of the mechanisms of heat and electrical conduction of the Earth and their relations concentrated during the year on the photon energy absorption of ferromagnesium silicates showed that the strong ultra-violet absorption of iron-bearing olivines was correlated with the presence of iron in the minerals.

In preliminary studies of all the non-thermal or 'noise-storm' events occurring during the past two years on the Sun no correlation has so far been found between the 'noise-storms' and optical features. The solar observational programme was extensively revised on January 1, 1959, and many older types of observations were discontinued or drastically curtailed to allow systematic examination of the newly discovered weaker magnetic fields which cover much of the solar surface. Observations of Mars with the 200-in. telescope in October 1958 by a guest investigator, Dr. W. N. Sinton, established the presence of three distinct absorption bands near 3·5 microns, chiefly in the dark areas and only very weakly in the bright areas, and in approximately the same positions as are found the reflexion spectra of terrestrial plants, and providing the most suggestive evidence yet to appear for the hypothesis that the dark areas on Mars are caused by some form of plant life which develops seasonally in these areas. Four new supernovæ were discovered during the year, two in nearby galaxies being bright enough for detailed observation. The chemical compositions of a large number of stars have been studied, and the observations and those on colour–magnitude relations are being correlated with data on the generation of nuclear energy and energy transfer from star core to star surface, and it is beginning to appear that the magnitudes and other properties of stars of a given class are affected substantially by the large differences in chemical composition observed. The Committee on Image Tubes for Telescopes has reported thirty-fold reduction in exposure time with two types of image tube, one a single-stage tube, including a photocathode, provisions for electron optics, and a phosphor screen coated on mica, and the other composed of two simple one-stage image tubes cascaded in series, with the phosphor screen of the second stage being photographed, using a fast-relay lens; but both types still have shortcomings.

In the Department of Terrestrial Magnetism the Biophysics Section continues to devote much attention to the study of ribonucleoprotein particles found in bacteria, and striking progress was made during the year in applying quantitative methods to such problems. Improved methods were developed for separating ribosomes of different sedimentation constants by centrifuging through a sucrose density gradient, and by incorporating radioactive tracers in cells for very short periods it was possible to observe nascent protein which is associated with bacterial ribosomes for a short period before it is released as a finished product. Bacterial ribosomes had the same function in protein synthesis as the ribosomes of higher organisms, but the speed of synthesis is about sixty times greater. The new measurements also confirmed the earlier hypothesis as to the nature of ribosome particles and the intricacy of the synthesis of ribosomes. The nucleotide compositions of several classes of ribonucleic acid from *Escherichia coli* were determined by isotope-dilution techniques, using chromatographic and electrophoretic separations, and further information was obtained on the enzyme content of ribosomes, while the mechanism of protein synthesis was also studied through the amino-acid analogue technique, and considerable information was obtained on the mechanism of amino-acid selection by cells.

* Carnegie Institution of Washington Year Book No. 58, July 1, 1958–June 30, 1959. Pp. xi+500+15 plates. (Washington, D.C.: Carnegie Institution of Washington, 1959.) 1 dollar, paper bound; 1.50 dollars, cloth bound.

In the Department of Plant Biology it has been demonstrated that simultaneous absorption of light by chlorophyll *a* and chlorophyll *b* both increases the efficiency of light utilization by chlorophyll *a* and raises the initial photosynthetic rate after a dark period markedly over a situation when chlorophyll *a* alone is activated by light. Enhancement effects were also observed from alternate pulsing, in periods of 0·6–15 sec., of light sources of wave-lengths absorbed by chlorophyll *a* on one hand and chlorophyll *b* on the other. Studies continued on the characterization of the different forms of chlorophyll *a* occurring in living plants and additional evidence was sought for the differentiation of the three forms of chlorophyll *a* through fluorescence spectrography, differential bleaching and in other ways. By high-speed centrifugation in a liquid medium of graded density, protochlorophyll holochrome has been obtained relatively free from blue and ultra-violet absorbing contaminants and the transformation from protochlorophyll to chlorophyll was studied by observing the degree of fluorescence of freshly forming chlorophyll. Electron-microscopical studies of etiolated plastids showed that chloroplast lamellæ will form in the absence of protochlorophyll, but the normal aggregation and close pairing of the lamellar disks require the presence of chlorophyll. A bacterial pigment with protochlorophyll-like absorption properties was extracted from a mutant of the purple bacterium, *Rhodopseudomonas spheroides*. The gathering of essential data for the study of range grass hybrids of *Poa* is being concluded, and the investigations have revealed principles relating to the synthesis of new forms in apomictic genera by interspecific hybridization. A study on the genetic structure and evolution of the yarrows, members of the polyploid *Achillea millefolium* complex, is also nearing completion, and studies on rates of photosynthesis and respiration of two altitudinal races of *Mimulus cardinalis*, one from sea-level near the coast of California and the other at middle altitudes in the Sierra Nevada of California, have shown them to differ in the temperature optima and requirements for light saturation when functioning as intact plants. A device has been installed that can regulate, within a narrow range, the carbon dioxide in the air of a small chamber, thus permitting study of the effects of different concentrations of carbon dioxide on plants and simplifying the control of air temperature and relative humidity. In an analysis of the chromosome constitution of races of maize grown in Chile, Bolivia, Ecuador and Venezuela, a relation was found between the knob pattern and the geographical location of the race, which suggests that, under some conditions, a knowledge of the patterns of distribution based on chromosomal-knob constitution may give valuable evidence of the origins and migrations and past history of some early races of Indian corn.

The Department of Genetics has continued to focus attention on the structural and functional properties of genes and chromosomes, and it now appears that the suppressor–mutator system of control of gene expression in maize has some major resemblances to the system controlling flagellar–antigen formation in *Salmonella*. Studies of the effects of deoxyribonuclease on unfixed cells have shown that this enzyme enters the living cell and there brings about marked swelling and deformation of chromosomes, sometimes without appreciable loss of deoxyribonucleic acid. Hybrids have been obtained of *Salmonella typhimurium* and *E. coli*, thus permitting comparison of the homology of their chromosome structure, and the chromosome of the bacteriophage *T2* has been shown to consist of deoxyribonucleic acid, while the mechanisms of replication and recombination of genetic material in bacteriophages has also been investigated.

Studies of the synthesis and interaction of specific macromolecules, in the Department of Embryology, have been specially concerned with tissue specificity, and further experiments in immuno-embryology suggest that there may be two stages in the development of the immune response, which may be experimentally separable. Continued study of immune response of new-born rabbits to injections of chicken liver and spleen homogenates suggests that animals not injected at birth respond strongly to a few major antigenic components, whereas the response of the treated experimental group is eliminated or reduced. A study of the effects of thyroxine upon the metamorphosis of visual pigment of the eyes of the bullfrog tadpole afforded substantial support for the view that thyroxine acts directly on a rate-limiting factor in the eye itself. Encouraging results have been obtained in experiments on the inductive ability of tissue microsomes designed to elucidate inconsistencies in embryonic induction, attributed to a failure of ribonucleic acid or ribonucleoprotein to reach its site of action.

STATUS AND DEVELOPMENT OF THE TEACHING OF CHEMISTRY

AT the Organization for European Economic Co-operation's Summer School for Science Teachers held in 1958 at Tutzing, Germany, the opinion was expressed that chemistry teaching in secondary schools has changed little since 1900 and that the present descriptive approach to the subject involves much memory work on the part of the student, and displays little of the scientific method. It was agreed that it was urgent that chemistry should be taught from the perspective of present-day theory and that so far as possible modern knowledge should be fed back to the school. As a result of these discussions the Organization for European Economic Co-operation's Office for Scientific and Technical Personnel, which works under the direction of Dr. Alexander King, in co-operation with the Irish Department of Education, organized a seminar at Greystones, Co. Wicklow, during February 28–March 10.

The objective of the seminar was to consider at a high level the preconditions and possibilities of: (1) a revision of chemistry teaching based on the knowledge of the atom; (2) pruning of the subject-matter in order to give more time to fundamentals without, however, neglecting adequate experimental work; (3) teaching chemical principles in such a way that they play a part in training the intellect of the pupil. The seminar was asked to come to conclusions concerning the specific steps required to provide the basis for a curriculum more fitted, intellectually and practically, to the needs of modern chemistry.

The following countries were represented at the seminar: Austria, Belgium, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom and United States. The participants comprised senior secondary school teachers of chemistry, those with official responsibility for chemistry programmes (senior officials of education ministries, inspectors of education), representatives of teacher-training institutes, professors of chemistry.

The proceedings were officially opened by Mr. Rafferty, secretary of the Irish Department of Education. Then followed the 'Keystone Address' of the chairman (Prof. T. S. Wheeler, Dublin). He recapitulated the objectives of the seminar and reviewed the papers to be presented, which were as follows: "Advances in Theoretical Chemistry since 1900" (Prof. K. Grob, Zurich); "The Importance of Molecular Structure in Elementary Chemical Teaching" (Prof. J. Bénard, Paris); "The Requirements for Entry to University Departments of Chemistry" (Prof. W. Cocker, Dublin); "The Requirements for School-leavers entering the Chemical Industry" (Dr. A. K. Mills, Dublin); "The Principles underlying Recent Advances in Practical Chemistry" (Dr. R. J. Magee, Belfast); "The Co-ordination of the Teaching of Chemistry, Physics and Mathematics in Secondary Schools" (Prof. M. Eurin, Paris); "The Teaching of Oxidation-Reduction and Acid-Base Reactions in Relation to the Electronic Atom" (Prof. A. Steiger, Zurich); "The Teaching of Chemistry to Students of 14–16 Years" (Dr. K. Stein, Bad Segeberg); "The Teaching of Chemistry to Students of 16–18 Years" (Dr. B. Borén, Stockholm); "Pruning and Simplification of the Syllabus and the Teaching of Fundamentals" (Prof. L. E. Strong, Richmond, Indiana); "New Materials and Teaching Aids, Text-books, Films, Models" (Prof. J. A. Campbell, Claremont, California).

The discussions were not confined to the set sessions, but were vigorous throughout the period of the seminar. Tuesday and the morning of Wednesday of the second week were devoted to the preparation of reports for transmission to the Organization for European Economic Co-operation. Owing to language difficulties, it was necessary to constitute three working parties (English and German; English and French; English or French, simultaneous interpretation). These parties were asked to make recommendations relating to two chemistry courses, one for students of 14–16 years and the other for those of 16–18. It was assumed that some three hours a week would be available for the study of the subject and that there would be facilities for experimental work.

It was realized that among countries conditions differ much as regards school-leaving age, facilities for practical work, time available for chemistry, and qualifications of teachers. In addition, schools have to cater for those who hope to become chemists and for others who have done with their chemistry when they leave school. Nevertheless it was considered that reports of the type envisaged would be of value to teachers anxious to modernize their courses, who could select to suit their needs.

Each working party had two chairmen (morning and afternoon) who kept in touch with the chairmen of other groups to ensure a measure of unity in the three approaches to the problems under consideration, though it was not thought disadvantageous to have three sets of views on the subjects at issue.

The reports were discussed at two plenary sessions of the seminar. It was agreed that the junior student should have his interest developed early in the constitution and properties of matter. Emphasis should be on observation, and formal definitions kept to a minimum. Methods other than the inductive arguments of Dalton should be used to develop the concept of atoms. The importance of space-filling models at all stages of instruction was stressed. The combustion of coke, the interaction of sulphur and copper, and similar systems can be employed to introduce the notions of chemical reactions, energy change, gaseous, liquid, and plastic systems, chemical equations and structural ideas. It is important that the student understand weight relationships and their correlation to chemical formulæ and equations.

For senior students atomic structure should be the framework of the course and not simply an additional chapter unco-ordinated with the rest of the chemical material presented. The Bohr–Rutherford atom provides a useful introduction; the nature of bonds should be discussed and directional characteristics emphasized. The law of mass action and chemical equilibrium should be treated in terms of reaction kinetics. The Brønsted treatment of acid-base equilibrium is recommended; redox systems can usefully be considered. Reaction mechanisms, thermochemistry and electrochemistry should also be treated in an advanced school course. So far as possible, phenomena should be related to structure; consideration of ion size can be illuminating in the study of crystals. The concept of electronegativity can also be employed to advantage in the discussion of chemical reactions.

Organic chemists should also be taught from the electronic point of view. The nature of single, double and triple bonds should be explained and the reactions of functional groups displayed in relation to their structure. The use of experimental results in the assignment of organic structures provides excellent examples of the application of the scientific method. If time permits, stereoisomerism should be discussed.

In all school courses the collection of a great number of facts about elements and compounds should be avoided. There is no necessity for systematic treatment of elements; examples should be drawn from the chemistry of one or more elements to illustrate a subject, for example redox systems, under discussion. Brief descriptions of technical processes should be introduced where they are of value in illustrating chemical principles. In this connexion reference was made to the tendency for accounts of out-of-date plant to be retained in school text-books. Properly prepared films and film strips can be of great help at all levels of instruction.

The seminar stressed the necessity for providing teaching of physics and mathematics such that the chemistry student has at all stages a knowledge of these ancillary subjects adequate for his needs. Finally, it was suggested that the Organization for European Economic Co-operation bring the recommendations to the notice of the appropriate authorities in the member countries with a request for comments. After an appropriate time small working parties, constituted similarly to the seminar, should meet in Paris to consider such comments as are received and to prepare manuals outlining school courses in chemistry relating to : (*a*) lectures ; (*b*) demonstration experiments by teachers ; (*c*) laboratory work by students. The necessity for devising means for training teachers capable of dealing with these new courses should also be considered.

The participants in the seminar felt that their discussion about a new approach to chemistry had been worth while, and that many concrete ideas of practical value had been elaborated.

T. S. WHEELER

WATER POLLUTION BY TRADE EFFLUENTS

THE last two major Acts in Britain governing the disposal of sewage and industrial effluents were the Public Health (Drainage of Trade Premises) Act of 1937 and the Rivers (Prevention of Pollution) Act of 1951 ; River Boards, which are responsible for controlling the discharge of polluting liquors to rivers, were set up by an Act passed in 1948. During the past few years, some of the provisions of the Acts of 1937 and 1951 have led to much discussion ; a committee, under the chairmanship of Sir Frederick Armer, set up by the Central Advisory Water Committee, after hearing evidence from the many interests concerned with pollution of surface waters, has now reviewed the experience of the past twenty years, and has recommended some important changes in the law*.

The Rivers (Prevention of Pollution) Act differentiated between discharges to streams already being made in 1951, and discharges made after that date. A River Board could control existing effluents in either of two ways : it could bring an action against anyone discharging a "poisonous, noxious, or polluting" liquid, it being left to the Court to decide whether the liquid could be so described, or it could make by-laws (which would require confirmation) covering a stream, or part of a stream, specifying standards of quality with which discharges would have to conform. It had been widely hoped and expected that River Boards would formulate by-laws, at least in industrial areas, since a manufacturer, for example, in designing a plant to treat a polluting liquor, clearly wishes to know the specification of the final effluent he is called on to produce.

It has been found, however, to be very difficult to formulate by-laws, and in fact none has so far been confirmed and come into operation. Since any standards adopted were expected to apply to a considerable length of river, if not to the whole of a river system, the first difficulty was to draw up a specification of permitted effluents which might have to be applied to a wide range of industrial wastes, the composition of which might be unknown, even to the manufacturers, and which might be so complex in composition as to make routine chemical analysis impracticable ; an example would be a liquor arising from the cooling and washing of a town's gas supply. This perhaps could have been overcome by examining liquors of whatever kind by a few comparatively simple tests, each designed to measure the effect of the liquor on some property of a stream. Among those suggested were tests for *p*H value, toxicity to fish, and concentration of suspended solids and oxidizable matter. A greater difficulty is that it is impracticable to treat all polluting liquors, particularly industrial liquors, to give effluents of a common standard of quality—a point which, from internal evidence, was clearly in the minds of those who drew up the Act of 1951.

Control of new or altered discharges brought into use after 1951 was, however, effected in a different way. Here a River Board could impose conditions on the nature and composition, and on the volume, of the discharges, each being considered separately. It was thus possible in each case to draw up a specification appropriate to the liquid to be discharged ; for example, for a liquor from electroplating, the maximum allowable concentrations of toxic metals and of cyanide would be specified. This machinery has worked very well, and since 1951 agreement has been reached on the conditions of discharge of large numbers of new effluents.

The Committee now recommends that River Boards should be empowered (subject to appeal) to deal with all discharges, whether new or existing, by essentially the same procedure. It was recognized that the improvement of the quality of some rivers, particularly the more heavily polluted of them in industrial areas, will have to be a gradual process It is proposed, therefore, that a River Board should have powers to impose standards on effluents which could be reviewed later, and, if necessary, made more stringent.

On the question of discharge of industrial wastes to sewers of a local authority, the chief change recommended is that, except where a contract is in force, the authority should now be empowered to make a charge for the treatment of liquors which have been discharged without major change since before 1937 ; under the Act of 1937 these acquired 'prescriptive rights' and were exempt from payment. All traders would have to furnish information to their local authorities on the volume and nature of effluents discharged to sewers

The Committee took evidence from all the major interests concerned with the purity of streams and, on all but one matter (the private rights of a riparian owner) have produced a unanimous report, which if implemented by legislation should greatly assist River Boards and local authorities in reducing the level of pollution of rivers in Great Britain.

IRIDIUM–PLATINUM ALLOYS

DR. A. S. DARLING has recently published a critical discussion of the constitution and properties of the iridium–platinum alloys*. Until comparatively recently it was generally believed that these metals were completely miscible in each other in both the liquid and solid states—the liquidus curve, lattice parameters, electrical resistivity and micro-structures all suggesting a continuous series of solid solutions. At the same time, there were other facts difficult to reconcile with such a view. As early as 1886 Le Chatelier had observed a thermal abnormality in the 20 per cent iridium alloy around 700° C., and in 1940 Masing, Eckhardt and Kloiber settled the matter by showing that a natural crystal from the Urals had a well-defined two-phase structure.

The true nature of the equilibrium diagram was finally established by Raub and Plate (*Z. Metallkunde*, 47, 688; 1956), who showed that there is a miscibility gap with a maximum at 975° C. and 50 atomic per cent. At 700° C. this gap extends from 7 to 99 atomic per cent of iridium. That earlier workers had failed to appreciate the true state of affairs was due to the extreme sluggishness of the change, annealing periods of the order of a year being required to establish "some semblance of equilibrium" in parts of the two-phase region. The most accurate method of determining this phase-boundary appears to be from measurements of electrical resistance.

The strength and hardness of the alloys increase rapidly with the iridium content, 30 per cent raising the tensile strength from 10 up to 56 tons per sq. in. for the alloy quenched from 1,100° C., the Vickers Pyramid Number increasing seven-fold. Cold-working has an equally marked effect, and the tensile strength of cold-drawn 20 per cent iridium wire may exceed 100 tons per sq. in. Very high hardness values can, as would be expected from the diagram, also be produced by quenching followed by subsequent ageing, the 50 per cent alloy quenched from 1,400° C. and reheated to 700° C. for 15 hr. having a Vickers Pyramid Number around 500. It is not clear, however, whether the fully aged alloys retain sufficient ductility to permit the hardness to be raised still further by cold work.

Alloys containing up to 40 per cent of iridium have been hot-forged and even drawn into wire, and when melted in the argon arc, alloys of still higher iridium contents can be worked with difficulty. The presence of iridium considerably increases the resistance of platinum to corrosion, the 40 per cent alloy being virtually unattacked by boiling aqua regia. The high evaporation losses of these alloys at high temperatures is attributed to the volatility of iridium oxide, a matter of importance in connexion with their use in pyrometry.

Among the more important uses of these alloys Dr. Darling mentions their applications in electrical contacts, precision resistors and potentiometer slide-wires. The 10 per cent iridium alloy used in combination with a 40 per cent palladium–gold wire which generates an electromotive force of 34 millivolts at 600° C. forms a useful thermocouple for moderate temperatures. Bridge wires in electric detonators, fuses and cartridge igniters, the needles used for the initial perforation of diamond wire-drawing dies, suspensions for scientific instruments and hair-springs are other uses to which these alloys have been put.

---

DEVELOPMENT OF LEARNING IN THE RHESUS MONKEY

DURING the past five years Harry F. Harlow and his colleagues have conducted an integrated series of researches into the learning capabilities of rhesus monkeys from birth to intellectual maturity*. Control over the monkey's environment has been achieved by separating the infants from their mothers at birth and raising them independently.

Half a decade is too brief a period to establish a definitive programme on the maturation of learning ability in the rhesus monkey, particularly in the later age-ranges. Within this period of time, however, techniques and tests have been developed which demonstrate that such a programme is feasible. The monkey is capable of solving simple learning problems during the first few days of life, and its capability of solving ever-increasingly complex problems matures progressively, probably for four to five years.

Early in life, new learning abilities appear rather suddenly within the space of a few days, but, from late infancy onward, the appearance of new learning powers is characterized by developmental stages during which particular performances progressively improve. There is a time at which increasingly difficult problems can first be solved, and a considerable delayed period before they can be solved with full adult efficiency.

The monkey possesses learning capacities far in excess of those of any infra-human primate, abilities comparable to those of low-level human imbeciles. The monkey's learning capabilities give little or no information concerning human language, and only incomplete information relating to thinking.

These are the generalizable limits of learning research on rhesus monkeys, but they provide an animal with vast research potentialities. There is a wealth of learning problems which the monkey can master, and at present the field is incompletely explored. The maturation of any learning function can be traced, and the nature and mechanisms underlying interproblem and intertask transfer can be assessed. Great research potentialities exist in analysing the fundamental similarities and differences among simple and complex learnings within a single species. The monkey is a subject ideally suited for studies involving neurological, biochemical and pharmacological correlates of behaviour. Rhesus monkeys can be raised under completely controlled conditions throughout a large part and, probably, all of their life-span, and the research of the future will probably correlate the neurophysiological variables, not with the behaviour of the static monkey, but with the behaviour of the monkey in terms of ontogenetic development.

SCIENTIFIC RESEARCH IN ANTARCTICA

THE Antarctic Treaty signed at Washington on December 1, 1959, by the British Government and by twelve others, all with interests, scientific or otherwise, in the Antarctic, including all seven claimants to the Antarctic's territories, recognized, in a preamble, that it is in the interests of all mankind that Antarctica should continue to be used exclusively for peaceful purposes and should not become the scene or object of international discord. The Treaty also recognized the extreme importance of scientific work and the firm foundation for the continuation of that work resulting from the International Geophysical Year.

In a short debate on the Antarctic in the House of Lords on February 18, opened by Lord Shackleton, who asked when the Government expected the Treaty to be ratified and what its policy was with regard to the future Antarctica, Lord Shackleton stressed the great value of the Antarctic as a source of scientific information. While that scientific interest had led to a remarkable degree of international co-operation, Lord Shackleton was somewhat concerned as to the possibility and effect of development, geologically and in other ways. In particular, he asked what provision had been made for the continuing discussion contemplated under Article 9 of the Treaty and what type of administration the Government had in mind. The Bishop of Norwich, who asked for a Government assurance that the British contribution in Antarctic investigation and research under the Treaty would not be less than that at present existing, also stressed the value of Antarctic research in long-range weather forecasting, geophysics, glaciology and some branches of biology ; and after a tribute to the work done by Great Britain in the past, he emphasized the value of the opportunity for international collaboration in scientific work which the Antarctic offered.

Lord Lansdowne, who replied for the Government, said that it hoped to ratify the Treaty at an early date and that the Government's policy was to promote the basic aims of the Treaty. The Treaty should ensure the use of Antarctica for peaceful purposes only and it was hoped that it had established a firm foundation for scientific co-operation. The Government would have preferred a more comprehensive system of administration, but this could not be achieved at the conference. The question of some form of permanent secretariat was now under discussion. On the exchange of strictly scientific information and the planning of research, which came under Article 3, the Government considered that governments should not attempt to supersede the existing organizations such as the Special Committee on Antarctic Research, which had been working effectively since 1958. This Article, in fact, said: "every encouragement shall be given to the establishment of co-operative working relations with those Specialized Agencies of the United Nations and other international organizations having a scientific or technical interest in Antarctica". He hoped we would continue to make full use of such recently created organization and of the Specialized Agencies of the United Nations. The Government expected the Falkland Islands Dependency Survey, which was a principal contributor to Antarctic research, to continue, and those people most immediately affected by the Treaty, such as observers, exchange scientists and their staffs were, in fact, covered by the juridical and administrative arrangements.

VISUAL PIGMENT OF THE HORSESHOE CRAB, *LIMULUS POLYPHEMUS*

By DR. RUTH HUBBARD and PROF. GEORGE WALD

Biological Laboratories, Harvard University, Cambridge, Mass.

OWING mainly to the work of Hartline, the eye of the horseshoe crab, *Limulus*, has long been a classic object for electrophysiological investigation. This was the first eye in which electrical responses were recorded from single visual receptors[1]. The large size of these units and the relative simplicity of their nervous connexions have permitted a degree of analysis not achieved with other types of visual element[2]. This growing body of electrophysiological information lends special interest to the chemistry of the underlying processes.

We have now extracted the visual pigment of *Limulus*. This is the fourth arthropod visual pigment to be examined and the first such pigment obtained from an arachnoid. Two visual pigments have been extracted earlier from crustaceans, one from a euphausiid[3], the other from a decapod, the lobster[4] ; and a visual pigment has also been obtained from an insect, the honey-bee[5].

The principal results of our experiments are summarized in Fig. 1. From a fraction of the eye tissues which we believe consisted largely of fragments of rhabdomeres, we have extracted a photosensitive pigment with $\lambda_{max.}$ 520 mμ. The chromophore of this pigment is retinene$_1$. We therefore consider it to be a rhodopsin. On exposure to light it bleaches to a mixture of retinene and opsin. This behaviour, characteristic of vertebrate rhodopsins, distinguishes the *Limulus* pigment sharply from certain other invertebrate rhodopsins—squid, octopus, cuttlefish, lobster—which under physiological conditions do not bleach but yield in the light relatively stable red-orange metarhodopsins, in which retinene remains attached as chromophore to opsin[4,6].

The curve shown in Fig. 1 is a difference spectrum measured in the presence of hydroxylamine. This reagent combines with retinene$_1$ to form retinene$_1$

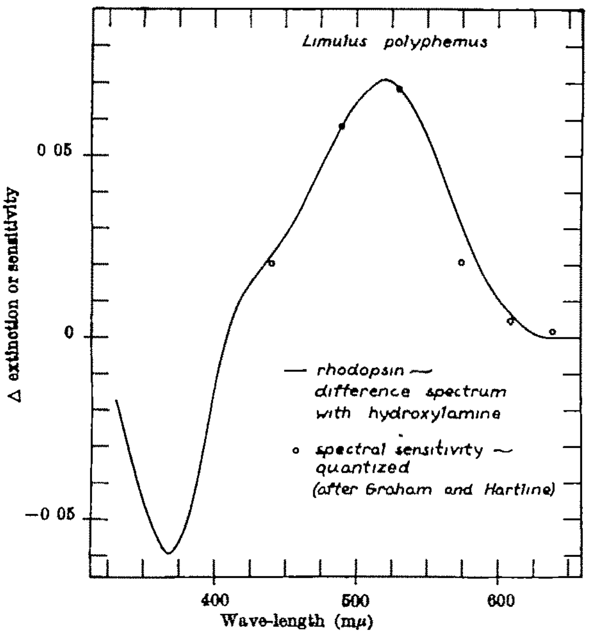

Fig. 1. Absorption spectrum of *Limulus* rhodopsin, compared with the spectral sensitivity of the photoreceptors *in vivo*. The difference spectrum, measured in the presence of hydroxylamine, shows the changes in absorption caused by exposure to light. The positive changes (λ_{max} 520 mμ) represent the bleaching of the visual pigment, and are equivalent to its true absorption spectrum at wave-lengths longer than 450 mμ. The negative changes represent the formation of retinene$_1$ oxime ($\lambda_{max.}$ 367 mμ) as a product of bleaching. The absorption spectrum of the visual pigment in solution agrees with the spectral sensitivity of the eye measured electrophysiologically by Graham and Hartline

oxime, with $\lambda_{max.}$ at 367 mμ, which appears as a minimum in this figure. The use of hydroxylamine identifies the product of bleaching unequivocally as retinene$_1$, and also makes the difference spectrum equivalent to the true absorption spectrum at wave-lengths longer than 450 mμ (ref. 7).

The points in Fig. 1 show the measurements by Graham and Hartline of the spectral sensitivity of photoreceptors in the eye of *Limulus*[8]. They are in good agreement with our absorption spectrum.

Our first attempt to find a visual pigment in the *Limulus* eye involved large, sexually mature animals (about 12–15 cm. across the carapace), collected on the beaches while mating. The eyes of these animals were highly sclerotic, and in most cases the corneas were virtually opaque, frequently heavily encrusted with algae, and sometimes perforated. On extracting these eyes, we found no photosensitive pigment or retinene, but obtained only a small amount of chlorophyll, presumably from the algae, and some carotenoid.

We therefore began working with young *Limulus*, 3–5 cm. across the carapace, having pliable, amber-coloured shells, and transparent corneas. The animals were dark-adapted over-night and all procedures carried out in dim red light. A cut was made around the cornea, and the eye was lifted off. The eyes were collected on dry ice and stored at −15° C.

In an earlier preparation of rhodopsin from lobster eyes[4] it had proved advantageous to isolate the structures containing the visual pigment—presumably the rhabdomeres—by using the methods ordinarily employed to isolate the outer segments of vertebrate rods and cones. We hoped in the same way to separate the rhabdomeres of the *Limulus* eye from the remaining tissues and black screening pigment.

In one of our first experiments, the eyes from 44 animals were thawed and ground thoroughly in a mortar with 8 ml. of 45 per cent sucrose in neutral $M/15$ phosphate buffer. This suspension was layered over in a centrifuge tube with neutral phosphate buffer and spun in a Spinco preparative ultracentrifuge at 40,000 r.p.m. for 10 min. A fine layer of tissue fragments, presumably including the rhabdomeres, collected at the interface between the sucrose and buffer solutions, the remaining tissues and black pigment forming a sediment at the bottom of the tube. The interfacial material was drawn off with a syringe and the sediment was reground and fractionated as before. The interfacial material from both these flotations was pooled, diluted with buffer, and sedimented by centrifuging at 40,000 r.p.m. for 15 min. The faintly straw-coloured supernatant was discarded and the tissue was extracted with 0·6 ml. of 2 per cent aqueous digitonin for 1 hr. at 5° C. After clearing this extract by centrifuging, its absorption spectrum was recorded in a Cary spectrophotometer. On exposure of this solution to light, a just perceptible bleaching occurred in the visible spectrum, accompanied by a small rise of extinction in the near ultra-violet, suggesting the bleaching of a visual pigment to retinene. However, the changes were much too small to yield a reliable record.

We first thought that our isolation procedure had possibly lost most of the visual pigment, and decided therefore to see whether retinene could be obtained from whole eyes and in what quantity. The eyes of 51 animals were ground in a mortar with about three times their volume of anhydrous sodium sulphate. The dry product was pre-extracted with petroleum ether in the dark. The extract contained a yellow carotenoid, epiphasic on partition between petroleum ether and 90 per cent methanol, both before and after saponification. It possessed absorption bands in hexane at about 425, 449, and 476 mμ and was apparently β-carotene. No vitamin A or retinene was found in this extract.

The tissue was then extracted exhaustively in the light with acetone containing a few per cent ethanol and water. The light should have bleached any visual pigment that was present, the acetone-ethanol should have destroyed it by denaturation. The extract, transferred to 2 ml. hexane, was pale yellow, owing to a small residue of carotene. The direct spectrum showed little but general absorption rising steeply into the near ultra-violet. The extract was transferred to 0·3 ml. chloroform, and 0·25 ml. of this solution was mixed with 1 drop of acetic anhydride and 0·5 ml. of saturated antimony trichloride in chloroform. The absorption spectrum, recorded immediately, is shown in Fig. 2, curve 1. It displays the absorption band characteristic of the antimony chloride product of retinene, with $\lambda_{max.}$ 667 mμ, distorted by a second band at shorter wavelengths ($\lambda_{max.}$ about 600 mμ) caused by some unidentified contaminant. The latter band faded rapidly, so that a second spectrum, recorded a few minutes later, displayed the retinene band alone (curve 2). From curve 2 one can calculate that this extract from 102 eyes contained about 4×10^{-4} μmole retinene, that is, about 4×10^{-6} μmole per eye. This amount of retinene from the whole eye is in reasonable agreement with the amount of rhodopsin we had extracted from the tissue isolated by flotation in the previous experiment. There was no reason to doubt, therefore, that we had isolated the correct tissue ; but

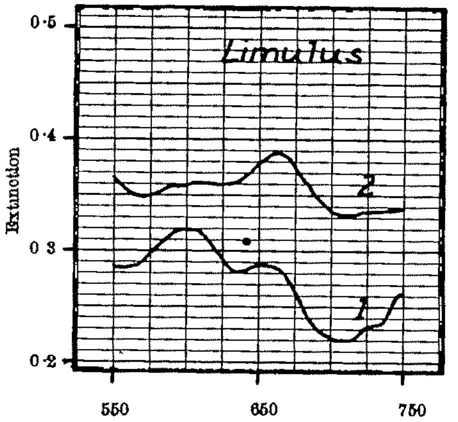

Fig. 2. Absorption spectrum of the product of the antimony chloride reaction with an extract of *Limulus* eyes. The spectrum, measured immediately after mixing the reagents (curve 1), displayed the absorption maximum characteristic of retinene$_1$ in this reaction ($\lambda_{max.}$ 667 mμ), distorted by another maximum at about 600 mμ, due to an unidentified contaminant. The latter faded rapidly, so that the spectrum, re-measured a few minutes later, displayed the retinene band alone (curve 2)

the small amount of photosensitive pigment in the *Limulus* eye introduced special difficulties.

We next isolated the rhabdomere tissue from 378 eyes of young animals, by the flotation procedure described above. This time the isolated tissue was frozen-dried, and pre-extracted exhaustively with petroleum ether. The extract contained β-carotene, about one-third as much as had been obtained from whole eyes.

The residual tissue was extracted with 0·6 ml. of 2 per cent digitonin. The extract was cleared by centrifuging and divided between two micro-absorption cells. Spectra were measured in the Cary model 11 recording spectrophotometer, with a 0–0·1 slide wire that magnifies the extinction 10 times. The results of these measurements are shown in Fig. 3.

The two halves of the extract were first balanced against each other to yield a base line (curve 1). One sample was then irradiated for 2 min. with orange light and the spectrum recorded (curve 2). The record made in these circumstances is a difference spectrum, the difference in absorption between the dark and irradiated solutions. Changes above the base-line represent bleaching due to light, changes below represent the formation of new absorbing material. Curve 2 shows bleaching maximal at about 530 mμ, with the simultaneous formation of a product absorbing maximally at about 370 mμ. This extract was then re-irradiated for 7 min., and allowed to stand in the dark for about 15 min., before recording curve 3. The maximum had now moved to about 520 mμ, an indication that *Limulus* rhodopsin, like that from other species, bleaches over orange-red intermediates such as metarhodopsin, which disappear slowly and thus distort the early difference spectrum. As with vertebrate rhodopsins, however, these distortions are abolished by using hydroxylamine (cf. Fig. 1).

To the remaining portion of the extract, kept in darkness until this point, neutral hydroxylamine was added to a final concentration of 0·04 *M*. Its spectrum was balanced in the spectrophotometer against that of the previously bleached solution, so as to yield a base line. Then this extract was irradiated for 2 min. with white light and left for half an hour in the dark until entirely stable. The result was the difference spectrum shown in Fig. 1, with $\lambda_{max.}$ 520 mμ, and with a minimum at 367 mμ, the absorption maximum of retinene$_1$ oxime.

From the spectrum shown in Fig. 1 one can estimate that we had extracted about 3×10^{-6} μmole of rhodopsin per eye, if one assumes that *Limulus* rhodopsin, like that of other animals, has a molar extinction of about 40,000[7]. This assumption is supported by the fact that bleaching *Limulus* rhodopsin yields about the same extinction of retinene oxime as is obtained from cattle rhodopsin[7]. The quantity of extracted pigment is in reasonable agreement with the amount of retinene we found in whole eyes (4×10^{-6} μmole per eye).

From these results one can estimate roughly the extinction of visual pigment *in situ*. It is generally assumed that in compound eyes the visual pigment is restricted to the rhabdomeres of the retinula cells. The rhabdom of *Limulus* takes the form of a central hub, filled by the dendrite of the eccentric cell, from which radiate fins, usually 10 in number, each formed by the fusion of two rhabdomeres at the surface of contact between adjacent retinula cells[9]. In animals of the size we used, the rhabdom is estimated to be about 100μ long, the fins being about 1·5μ wide (0·75μ contributed by each of the two adjacent rhabdomeres which fuse) and projecting about 10μ from the centre. The entire volume of rhabdomere material, therefore, is about $1{\cdot}5 \times 10^4\mu^3$ (that is, $10 \times 100 \times 1{\cdot}5 \times 10$). Animals of this size have 800–1,200 ommatidia. The volume of rhabdom per eye is therefore of the order of $1{\cdot}5 \times 10^7\mu^3$

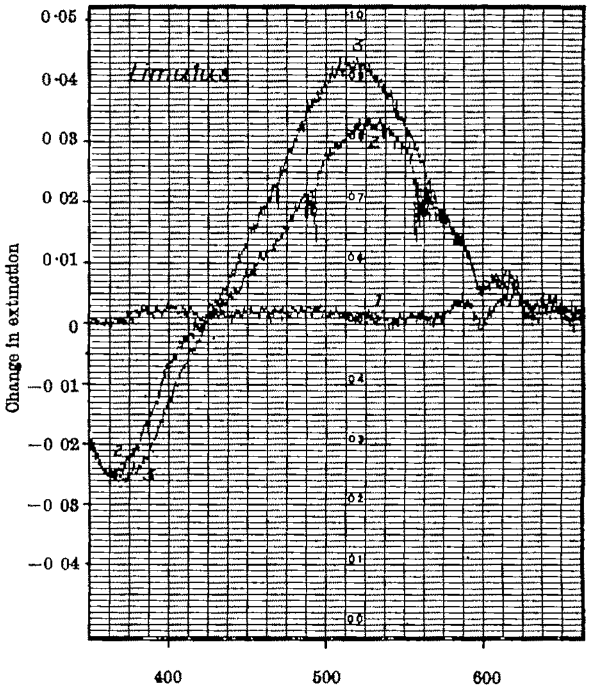

Fig. 3. Difference spectra of *Limulus* rhodopsin in aqueous solution, recorded with a Cary spectrophotometer using a 0–0·1 slide-wire that amplifies the extinction scale ten times. Two portions of the extract were balanced against each other to yield a base-line (1). Then one portion was exposed to light for 2 min.; the difference spectrum (2) shows bleaching maximal at about 530 mμ, and the simultaneous formation of a product with $\lambda_{max.}$ about 370 mμ (retinene$_1$). After a second irradiation and a period in darkness, the solution had become stable (3); $\lambda_{max.}$ now lay at 520 mμ

(ref. 10). If one assumes that *Limulus* rhodopsin has an extinction of about 40,000, 4×10^{-6} μmole of rhodopsin distributed evenly over this volume would have an extinction at 520 mμ of 0·07 in a layer 100μ deep, corresponding to the length of the rhabdom. This extinction is equivalent to an absorption of about 15 per cent. It is interesting that this absorption is of about the same order as occurs in the rods of a number of vertebrate eyes[11].

The only previous report of the extraction of a photo-pigment from the *Limulus* eye is contained in a single sentence and a figure in a paper by Bliss, dealing primarily with squid rhodopsin[12]. According to Bliss, the *Limulus* pigment bleached in the light only after treatment with formaldehyde. The difference spectrum he measured had a maximal extinction of 0·004, lower therefore than one can ordinarily measure accurately; yet the eyes would have had to contain about seven times as much pigment as we find, to yield this extinction under the conditions of his experiment ("15 retinas from 4 cm. wide animals, dissolved in 3 cc."). The $\lambda_{\max.}$ of this pigment was at about 480 mμ. This description, therefore, differs on all counts from the present observations.

This investigation was supported in part by funds from the Division of Neurological Diseases and Blindness of the U.S. Public Health Service (grant *B*-568 *C*-5), the Office of Naval Research, and the Rockefeller Foundation. We are grateful to Dr. H. K. Hartline for advice, and to him and Dr. Miller for information concerning the dimensions of the *Limulus* photoreceptors.

FRACTIONATION OF TWO METABOLICALLY DISTINCT CLASSES OF RIBONUCLEIC ACIDS IN ANIMAL CELLS AND ITS BEARINGS ON CANCER

By Prof. A. SIBATANI, K. YAMANA, K. KIMURA and T. TAKAHASHI*

Cytochemistry Laboratory, Yamaguti Medical School, Ube, and the Department of Biology,
Faculty of Science, Kyushu University, Fukuoka, Japan

RECENTLY we have shown[1] that the treatment of suspensions or homogenates of normal and malignant animal cells with aqueous phenol may lead to a fractionation of their ribonucleic acids into two components differing markedly in the nucleotide composition and the rate of uptake of phosphorus-32.

The procedure we are employing for such studies may be summarized as follows. A part of the material labelled *in vivo* or *in vitro* with phosphorus-32-orthophosphate (1–2·5 hr.) was fractionated by the Schmidt–Thannhauser method[2] to obtain the total ribo- and deoxyribo-nucleic acids. The rest of the material was treated with 90 per cent phenol[3], and the ribonucleic acid released into the aqueous phase (fraction *P*) was dialysed against water and hydrolysed with alkali[2]. The phenol layer was treated with ethanol and the precipitated protein material was fractionated by the Schmidt–Thannhauser method to recover the residual ribonucleic acid (fraction *R*). The nucleotide composition of various ribonucleic acids was determined by 'Dowex-1' (formate) chromatography[2]. The separated nucleotides were purified by charcoal adsorption[1], and uridylic acid was further paper-chromatographed in *n*-propanol–ammonia–water (60 : 30 : 10)[4]. Alternatively, the alkaline hydrolysates of ribonucleic acids were first adsorbed on charcoal[4] and then the eluted mixed nucleotides paper-chromatographed as above. Deoxyribonucleic acid was usually extracted with hot dodecyl sulphate[5] from the acid-precipitated residue of the Schmidt–Thannhauser method. The specific activity of ribonucleic acid was calculated as the weighted mean of those of the separated nucleotides, or approximated by determining that of combined adenylic, cytidylic and uridylic acids in the eluate from the unresolved single spot on the paper[4]. The specific activity of deoxyribonucleic acid was determined directly.

The fraction *P* ribonucleic acid had a high guanylic acid content and a low specific radioactivity, while the fraction *R* showed a low guanylic acid content and a markedly high specific radioactivity[1]. The proportion of the fraction *P* in total ribonucleic acid was about 70 per cent in rabbit lymphatic cells and the appendix, about 85 per cent in the rat liver and 90–95 per cent in the mouse Ehrlich ascites carcinoma and rat ascites hepatoma *AH*-7974. The nucleotide composition of various fractions is listed in Table 1. In some instances, especially in tumours, cytidylic acid content was also appreciably lower in fraction *R*.

The most remarkable point of these findings is the fact that the specific activity of the fraction *P* was usually very close to that of deoxyribonucleic acid in various tissues differing markedly in the rate of deoxyribonucleic acid synthesis. Also it must be stressed that, by Kirby's method[3] of ribonucleic acid extraction with phenol which is now extensively employed, one may very well be discarding the bulk of ribonucleic acid with high turnover rate.

Table 1. NUCLEOTIDE COMPOSITION OF RIBONUCLEIC ACIDS

Material	Ribonucleic acid fraction	Molar ratio (adenylic acid = 10)			E_{260} recovery (per cent)
		Guanylic acid	Uridylic acid	Cytidylic acid	
Lymphatic cells of rabbit appendix	Total	17·5	10·1	15·3	96·5
	P	20·2	10·6	16·2	101
Rabbit appendix	*P–A*	16·1	10·3	13·0	80·0
	P–B	18·9	10·4	14·6	92·8
	R	15·9	10·0	12·8	95·0
Rat liver	Total	18·0	9·0	16·7	88·2
	P	19·6	10·1	16·0	82·0
	R	14·5	9·0	15·3	79·9
Mouse Ehrlich ascites tumour (7 days)	Total	17·9	10·8	15·1	92·2
	P	19·8	11·1	15·4	98·1
	R	12·1	9·9	11·2	104
Rat ascites hepatoma *AH*-7974 (7 days)	Total	17·4	7·9	15·0	99·2
	P	18·4	11·7	15·1	93·3
	R	11·7	10·0	11·5	100

Table 2. *In vivo* INCORPORATION OF PHOSPHORUS-32 INTO FRACTIONS OF RIBONUCLEIC ACIDS OF SOME ASCITES TUMOUR CELLS

	Mouse Ehrlich ascites carcinoma			Rat ascites hepatoma *AH*-7974
Age of tumour (day)	10	7	7	12
Duration of incorporation experiment (hr.)	2·5	2	2	2
Ribonucleic acid fraction	Specific activity (counts/min./μgm. P)			
Total	15·7	35·0	10·1	9·30
P	6·78	15·0	2·78	4·42
R	65·2	191	48·7	73·6
(Deoxyribonucleic acid)	6·70	17·0	10·1	15·4

The specific activity of the fraction *P* may further be reduced a little by a fractionation utilizing the solubility difference in molar sodium chloride solution. A small amount of soluble ribonucleic acid (fraction *P–A*) with a relatively high specific activity may be removed from the bulk of ribonucleic acid which is precipitated in this salt solution (fraction *P–B*). Such a finding corroborates that of Brown *et al.*[6]. Whether or not the fraction *P–A* is a mixture of the fraction *P–B* and fraction *R* is not clear at the moment.

The simplest interpretation of the above observations would be to postulate the occurrence in animal cells of two principal classes of ribonucleic acids differing in composition, metabolic activity, and mode of linkage with proteins which may serve as the basis of fractionation with phenol. We will call such classes of ribonucleic acids class I and class II, the former being released by phenol and the latter remaining in the residue in typical experiments. It should be emphasized here that the terms fraction *P* and *R* pertain to the extraction procedure using phenol no matter what their chemical or metabolic properties, while the designations 'class I' and 'class II' ribonucleic acids represent partially hypothetical entities.

It is suggested from the specific activity determination that class I ribonucleic acid is duplicated only once during the mitotic cycle like deoxyribonucleic acid, so far as the composition of the cell is kept constant. Because deoxyribonucleic acid is believed to be metabolically rather inert[7], the specific activity of any phosphate compound of cells incorporating radiophosphate, even in the absence of turnover, cannot be appreciably lower than that into deoxyribonucleic acid in the steady state. It can be inferred, therefore, that class I ribonucleic acid may be conserved without turnover in proliferating or non-proliferating cells of fixed composition. The fraction *P* probably contains class I ribonucleic acid in a relatively pure form, being free from contamination by class II ribonucleic acid, which would significantly raise the specific activity of the fraction *P* over that of deoxyribonucleic acid. Whether the fraction *R* represents more or less pure class II ribonucleic acid cannot be determined at the moment.

The close agreement of the specific activities of deoxyribonucleic acid and of fraction *P* ribonucleic acid may not be realized in systems changing their composition. In regenerating rat liver the synthesis of class I ribonucleic acid seems to be enhanced prior to that of deoxyribonucleic acid[1]. In ascites tumour also, the specific activity of fraction *P* ribonucleic acid was sometimes found to be lower than that of deoxyribonucleic acid (Table 2). Indeed, a continuous decrease in ribonucleic acid content per cell during the growth of the Landschütz ascites tumour of the mouse has been reported[8].

The hypothesis of the occurrence of cellular ribonucleic acids in two classes can be tested by studies on ribonucleic acids in subcellular components. However, results so far obtained have been mostly erratic for the reason suggested below, so that we are still not in a position to discuss the matter at full length. To mention some positive results (Table 3), both nuclei and cytoplasm of the rabbit appendix yielded the two fractions which would represent classes I and II. It is noted that the proportion of the fraction *R* was much higher in nuclei the ribonucleic acid of which resembles the class II ribonucleic acid in guanylic acid content and the turnover rate[2]. Also free cytoplasmic ribonucleoprotein particles (ribosomes) of the rabbit appendix gave fractions with properties in line with the results on whole cells.

In earlier experiments consistent results were obtained by an indiscriminate use of commercial phenol, but it was soon found that the use of different batches of phenol might result in a marked change in the efficiency of fractionation. The use of redistilled phenol made the results even worse. Prob-

Table 3. RIBONUCLEIC ACIDS OF SOME SUBCELLULAR COMPONENTS OF RABBIT APPENDIX LABELLED WITH PHOSPHORUS-32 *in vivo*

Ribonucleic acid fraction	Relative amount (per cent of total)			Guanylic acid content (adenylic acid = 10)			Specific activity (counts/min./μgm. P)		
	Nucleus	Cytoplasm	Ribosome	Nucleus	Cytoplasm	Ribosome	Nucleus	Cytoplasm	Ribosome
P–A	1·0	3·0	1·3	—	—	—	—	4·03	—
P–B	43·1	75·6	79·1	17·7	16·4	17·1	7·34	2·24	0·79
R	55·9	21·4	19·6	13·0	12·1	15·0	27·4	5·91	17·5
(Deoxyribonucleic acid)							6·53	2·02	6·31

Nuclei and cytoplasm were separated according to Osawa *et al.* (ref. 2). Ribosomes (free ribonucleoprotein particles) were sedimented at 105,000*g* for 90 min. from a 0·25 *M* sucrose homogenate after removing larger particles by centrifuging at 44,000*g* for 30 min. Values for individual subcellular components were obtained in separate experiments lasting 2 hr.

ably some impurities in the commercial phenol may be of critical importance, and the use of reagents of lower degree of purity generally resulted in a consistent and clear-cut fractionation. The critical factor(s) may also be provided by the tissues. Thus, the rabbit liver gave a relatively 'good' fractionation with re-distilled phenol, while the appendix and kidney yielded a 'poor' fractionation with the same phenol. Some monovalent and divalent cations such as sodium or calcium ions were effective in improving the extent of fractionation, and the addition of ethylenediamine tetraacetate affected the fractionation, while magnesium ions were without effect. Temperature (0–37°) does not seem to be very critical, while the *p*H of the medium (before addition of phenol) is obviously of great importance, the best fractionation so far being obtained at *p*H 6–7. Unless such factors are carefully controlled, isolated subcellular components tend to yield a poor fractionation, and the specific activity of the fraction *P* may no longer be close to that of deoxyribonucleic acid and vary considerably among different subcellular fractions[9].

Several authors[10] have reported a remarkably high guanylic acid content of neoplastic ribonucleic acids. This would suggest a depletion of class II ribonucleic acid in tumour cells, and our observation confirmed it. Extensive uptake of labelled precursors by ribonucleic acid of tumour cells, in spite of the deficiency of class II ribonucleic acid with high turnover rate, may partly be explained by an active net synthesis of class I ribonucleic acid.

It was also reported that the bulk of ribonucleic acid of tumour cells showed little turnover[11]. This fact would again be a reflexion of the marked preponderance in tumour cells of class I ribonucleic acid which appears to be metabolically rather inert. In this connexion it is of interest that the acid ribonuclease activity per unit amount of ribonucleic acid is much lower in tumour cells than in normal cells[12]. However, whether this fact has some bearings on the metabolic stability of the bulk of ribonucleic acid in cancer cells is not clear.

Thus, the relationship between the synthesis of class I ribonucleic acid and that of deoxyribonucleic acid, and the role of two classes of ribonucleic acids in the transfer of genetic information and in protein synthesis may become attractive problems in cell physiology and cancer research.

This work was aided in part by a grant from the Ministry of Education. We express our thanks to Dr. Waro Nakahara, director of the Cancer Institute, Tokyo, for his encouragement and interest in this work. We are further indebted to Prof. S. Nakamura and Prof. S. Shibata, Yamaguti Medical School, for the use of instruments in their laboratories, and to Prof. I. Kawakami, Kyushu University, Dr. S. Osawa, Nagoya University, and Dr. Y. Sugino, Kyoto University, for their advice and discussion.

CHLOROPHYLL CONTENT OF GIBBERELLIN-TREATED WHEAT SEEDLINGS

By Prof. FREDERICK T. WOLF* and Dr. ALAN H. HABER

Biology Division, Oak Ridge National Laboratory†, Oak Ridge, Tennessee

INCREASED plant growth stimulated by gibberellic acid is generally accompanied by a paling of the leaves[1–3]. In a recent review, Brian summarized the situation as follows: "The leaves formed after treatment are noticeably paler in colour than usual. This is a general response to gibberellic acid; it can be to a considerable extent reduced by ensuring that mineral nutrients, especially nitrogen, are not limiting, but even under the best nutrient conditions some chlorosis is usually visible. It is not known whether the chlorosis is due to a destruction of pigment, reduced rate of synthesis of pigment, to a failure of pigment synthesis to keep in step with the increased cell extension, or to change in pigment composition"[4]. In this article we present the results of an investigation of the relation between the effects of gibberellic acid treatment on growth and on pigment content.

'Gibrel' (potassium salt of gibberellic acid) was kindly given by Merck and Co. Wheat grains were germinated and the seedlings grown in Petri dishes containing water or 3×10^{-4} *M* gibberellic acid ($\sim$ 115 p.p.m.), as described previously[5], under 400–500 ft.-candles of white light during 16-hr. days. Chlorophylls *a* and *b* were analysed according to "Official Methods of Analysis" of the Association of Official Agricultural Chemists[6] or by Robbelen's method[7]; total carotenoids were estimated by the latter method. Twelve to sixteen seedlings were used in each determination.

Results of a typical experiment are given in Table 1. Six days after sowing, the height of plants treated with gibberellic acid had increased at least 60 per cent more than the controls and the leaves were indeed paler. But the chlorophyll content was not

Table 1. INFLUENCE OF GIBBERELLIC ACID ON THE GROWTH AND CHLOROPHYLL CONTENT OF WHEAT SEEDLINGS

Treatment	Age 6 days	12 days	18 days*	24 days*	30 days*
			Height (mm.)		
Control	59·5	100·8	140·1	249·0	294·8
Gibberellic acid	98·8	176·1	258·7	356·3	404·5
			Fresh weight (mgm.)		
Control	38·9	75·7	124·3	340·5	544·4
Gibberellic acid	42·2	80·1	131·4	309·3	420·8
			Total chlorophyll (μgm.)		
Control	26·8	56·7	126·0	381·2	583·8
Gibberellic acid	26·1	46·2	81·2	248·6	370·8

* Plants removed from Petri dishes and transplanted to pots of soil after 12 days.

significantly different in treated and untreated plants. After 12 days, the chlorophyll content of the treated plants was about 20 per cent less than in the controls. Total carotenoid values were 12·5 μgm. per plant for the controls and 10·4 μgm. for treated plants. Hence the reductions in amounts of chlorophyll and carotenoid in treated plants were about the same. The difference in chlorophyll content between the treated plants and controls increases with time.

Twenty determinations of the chlorophyll *a* : chlorophyll *b* ratio in each of the two series of plants showed 75·6 per cent of the total chlorophyll consisted of chlorophyll *a* in the controls and 75·5 per cent in the plants grown in gibberellic acid. Obviously, the difference between the appearances of the two groups of plants cannot be related to a change in the proportion of the two chlorophylls.

Leaves of etiolated seedlings grown for 8 days in water in darkness were excised, placed in vials containing water or gibberellic acid, and exposed to 1,000 ft.-candles of light from a water-cooled source similar to that described by Withrow and Elstad[8]. Measurements of chlorophyll content during the subsequent 48 hr. (Fig. 1) showed no significant difference in rate of chlorophyll synthesis during greening, and therefore no difference in chlorophyll anabolism from gibberellic acid treatment.

Five-day-old seedlings grown in water were placed in 3 × 10^{-4} *M* gibberellic acid and at the same time transferred to continuous darkness. The disappearance of chlorophyll in dark-grown plants and in plants similarly treated in all respects except for treatment with gibberellic acid were compared. The acid had no effect on chlorophyll disappearance, and therefore no effect on chlorophyll catabolism (Fig. 2), even though the plants responded to the gibberellic acid in darkness. The average heights of the treated and control plants after the seven days in darkness were 180·4 and 132·6 mm., respectively.

The findings with young plants (5–8 days old) indicate that gibberellic acid can exert a pronounced effect on growth without affecting the total content, anabolism, or catabolism of chlorophyll. The paler appearance of six-day-old treated plants therefore results solely from pigment dilution. Since the pigment content does not differ significantly in these treated and control plants, there is no real chlorosis. The chlorophyll content of older treated plants (12 days or more) is less than in the untreated controls. But since gibberellic acid promotes growth without affecting the content, synthesis, or destruction of chlorophyll in young plants, its influence on chlorophylls and other pigments in older plants is probably an indirect result of its growth stimulation. These results support the suggestion that 'chlorosis' induced by gibberellic acid is in part related to nutritional deficiencies[3,4]. The acid does not influence the pigment content of the very young seedlings adequately supplied with nutriment from the grain, but does reduce the pigment content of older plants. This may be correlated with the growth results in Table 1, which indicate that the untreated plants eventually surpass the treated seedlings in growth-rate.

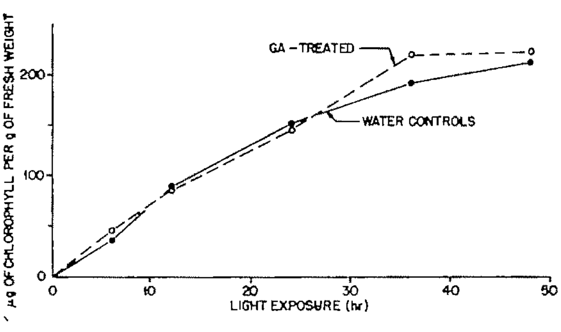

Fig. 1. Effect of gibberellic acid on greening of 8-day-old detached etiolated wheat leaves

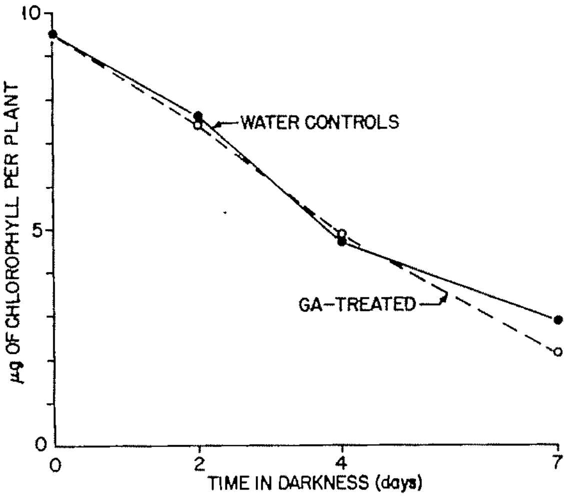

Fig. 2. Effect of gibberellic acid on disappearance of chlorophyll after transferring 5-day-old wheat seedlings to continuous darkness

These results demonstrate that (*a*) chlorosis does not necessarily accompany growth stimulated by gibberellic acid and (*b*) the paling in very young seedlings results solely from a failure of chlorophyll synthesis to keep pace with the increased cell expansion[5]. Besides the simple dilution of chlorophyll, the apparent chlorosis in older plants must also result from delayed effects of malnutrition, not to direct action of the acid on formation or destruction of chlorophyll. Stimulation of growth by gibberellic acid without direct effect on chlorophyll metabolism is consistent with the finding that the acid does not directly affect photosynthesis[9].

We wish to thank Mrs. Helen Luippold, Mrs. Dora Furr, and Mr. Joe White for help in caring for the plants and for assistance in the experiments.

PROTEIN COMPONENTS FROM TURNIP YELLOW MOSAIC VIRUS

By Dr. J. M. KAPER

Department of Biochemistry, University of Leyden

RECENTLY we reported a degradation method[1] with which soluble protein fragments were obtained from a purified preparation of turnip yellow mosaic virus. Evidence was presented that the alkaline treatment involved had not affected the peptide bonds of the protein. Under the electron-microscope the preparation showed spherical particles of a certain minimal diameter and also larger aggregates of variable size, all of which were much smaller than the virus particles, however.

Since then I have started to investigate the products of the alkaline treatment of the virus by means of electrophoresis and the ultracentrifuge.

Turnip yellow mosaic virus purified by the butanol–chloroform procedure[2] was treated with 0·13 *M* dipotassium hydrogen phosphate–sodium hydroxide buffer of *p*H 11·2 (virus concentration in mixture was 1 per cent). During this treatment, extending over a period of approximately 2½ days at room temperature, the *p*H of the reaction mixture dropped from 11·2 to 11·0. After the reaction, part of the mixture was set aside while the rest was subjected to ultracentrifugation in the Spinco model *L* ultracentrifuge for 2 hr. at 40,000 rev./min. After termination of the run, the resulting pellet and supernatant fractions were separated. The supernatant was set aside, the pellet was re-suspended in distilled water and again ultracentrifuged for 2 hr. at 40,000 rev./min. This washing and ultracentrifugation procedure was repeated once more, after which the pellet was taken up in distilled water. The three solutions (total mixture, pellet, and supernatant fraction) thus obtained were dialysed against 0·1μ *p*H = 7 buffer[3] for 2 days at 5° C. with three additional buffer changes to equilibrate for electrophoretic and sedimentation analysis.

Electrophoresis was performed at room temperature in the Kern *LK*30 micro-electrophoresis apparatus equipped with Jamin interference optics. Sedimentation analysis was carried out at 20° C. in the Spinco ultracentrifuge model *E* with schlieren optics.

Fig. 1 shows the electrophoretic pattern of the reaction mixture after 29 min. of electrophoresis at 53 V. and 3·8 m.amp. The upper limb in the picture represents the mixture of components ascending towards the anode. The presence of three main components with different mobilities is evident, although in the upper limb most of the fastest-moving gradient has left the cell already.

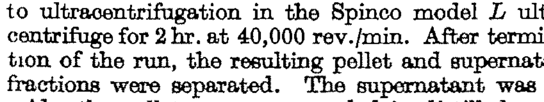

Fig. 1. Electrophoresis pattern of the reaction mixture after treatment of turnip yellow mosaic virus at *p*H 11·2–11·0. Buffer: 0·1μ, *p*H 7, room temperature

(a), Polynucleotide gradient; (b) gradient of pellet fraction; (c), soluble protein gradient

Through analysis of the supernatant fraction (which can be shown to contain the soluble protein[1] and polynucleotide material) and the pellet fraction, gradient (*a*) in Fig. 1 could be identified with polynucleotide material which had been liberated from the virus and which was not dialysable; gradients (*c*) and (*b*) represented the soluble protein and the pellet fraction respectively. Control analysis of intact turnip yellow mosaic virus under the same experimental conditions showed that the pellet fraction and the virus had identical electrophoretic mobilities; this was further corroborated by mixing the two substances and analysing them at *p*H 7·0, 8·3 and 9·5, under which conditions they behaved as one component in electrophoresis. The ultra-violet spectrum of the pellet fraction was predominantly of protein character (maximum 270 mμ, minimum 250 mμ and shoulder at 290 mμ), although it was evident that small amounts of nucleic acid in one form or another were present in the fraction.

Fig. 2*A* shows the sedimentation pattern of the reaction mixture in the ultracentrifuge 5 min. after reaching the desired speed of 59,780 rev./min. Here again we observe three main components and a small amount of a fourth. The identification of the various boundaries with the fractions obtained in the preparative procedure was carried out by separate runs, as in the electrophoresis. In Fig. 2*A* the gradients are designated accordingly. The sedimentation coefficient (uncorr.) of (*b*) was determined from this run and found to be 47 *S*. In separate runs of the pellet fraction at 33,450 rev./min. and at dilutions as much as 0·005 per cent we found sedimentation coefficients of 52–53 *S*. As is evident from Fig. 2*B*, the pellet fraction gives a sharp and symmetrical boundary and is only contaminated by a small amount of substance with sedimentation-rate of approximately 80 *S*. Gradient (*c*) in Fig. 2*A* shows a pronounced polydispersity and represents the soluble protein which we described earlier[1]; (*a*) is the polynucleotide material resulting from the degradation of the virus-nucleic acid. Figs. 2*C* and 2*D* represent the sedimentation patterns of reaction mixtures of turnip yellow mosaic virus treated at *p*H 12·1–11·9 and *p*H 10·8–10·5 (the two *p*H-values indicate the *p*H at the beginning and at the end of the reaction).

The pellet fractions of both mixtures analysed separately had sedimentation coefficients of 52–53 *S* again. The fraction containing the soluble protein from the *p*H 12·1–11·9 treatment (Fig. 2*C*) showed much less polydispersity and the sedimentation

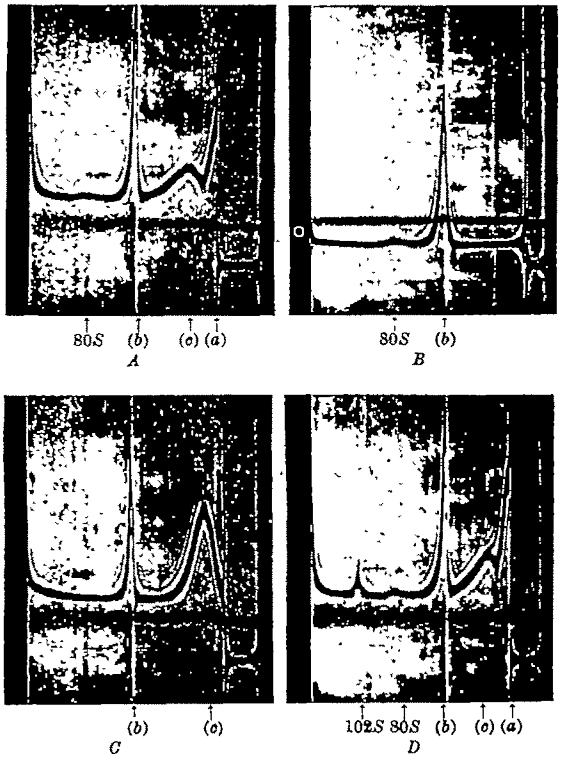

Fig. 2. Sedimentation patterns of degradation products of turnip yellow mosaic virus. Buffers: 0·1μ *p*H 7; temperature, 20° C. (The horizontal streak which is visible on all our schlieren diagrams is not caused by irregularities in the systems under measurement, but could, according to the Spinco field engineer, be attributed to dust particles which had accumulated on the mercury lamp just in front of the slit)

A, reaction mixture from degradation at *p*H 11·2–11 0; 5 min. after reaching speed of 59,780 rev./min.

B, pellet fraction (conc. 0·25 per cent) obtained from degradation at *p*H 11·2–11 0; 26 min. after reaching speed of 33,450 rev./min.

C, reaction mixture from degradation at *p*H 12 1–11·9; 5 min. after reaching speed of 59,780 rev./min.

D, reaction mixture from degradation at *p*H 10 8–10 5; 3 min. after reaching desired speed of 59,780 rev./min.

(*a*) polynucleotide gradient; (*b*) gradient of pellet fraction; (*c*) soluble protein gradient

coefficient determined from the 'peak' of (*c*) was about 11 *S*. Electrophoresis of the reaction mixture of *p*H 12·1–11·9 showed that no change had occurred in the relative mobilities of both components, but that the relative concentrations had changed in favour of the soluble protein. Polynucleotide material could no longer be detected, as apparently the nucleic acid had broken down to dialysable nucleotides. The ultra-violet spectrum of the pellet fraction (Fig. 3) obtained at this *p*H had more protein character; this might be attributed to the absence of the 80 *S*-contamination.

The reaction mixture at *p*H 10·8–10·5 showed quite the opposite picture (Fig. 2*D*) which, of course, could be anticipated. Gradient (*a*), representing the polynucleotides, is again present, gradient (*c*) shows very much polydispersity and, in addition to the 80 *S*-component, there is an appreciable amount of fast-moving substance with a sedimentation coefficient of 102 *S*, which probably represents residual virus. Electrophoresis showed again the gradients (*a*), (*b*) and (*c*) with the same relative mobilities as in the other experiments.

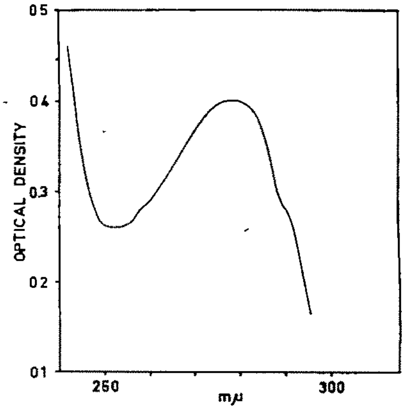

Fig. 3. Ultra-violet spectrum of pellet fraction isolated from treatment of turnip yellow mosaic virus at *p*H 12·1–11·9. Buffer, 0·1μ, *p*H 7

One main conclusion emerges from the experiments described. Through alkaline treatment of turnip yellow mosaic virus it is possible to penetrate the virus and affect the imbedded nucleic acid in such a way that it starts to leak out in (poly) nucleotide fragments of variable size, depending on the *p*H of the reaction. After the (poly) nucleotides have leaked out, they leave an empty or virtually empty protein shell. This material can be isolated by a simple differential centrifugation procedure. That the protein shell has probably remained intact seems evident when the identical electrophoretic mobilities of both virus and protein are considered and when its sedimentation coefficient, 53 *S*, is compared with those of Markham[4] (48·8 *S*) and of Lyttleton *et al.*[5] (50 *S*) for turnip yellow mosaic virus top component. In addition to this, we have compared the 'natural' virus plus top-component system, isolated by the procedure described by Cosentino *et al.*[6], with a 'reconstructed' system, obtained by mixing the virus (without top component) and the 53 *S* component in approximately the same concentration ratio. The sedimentation patterns thus obtained, with sedimentation coefficients of 52 *S* and 109·5 *S* (virus) for the 'natural' system and 53·5 *S* and 109 *S* for the 'reconstructed' system, were virtually identical.

Besides the full-size protein, fragments of smaller size are obtained[1]. We do not know as yet what is the exact sequence of events during the alkaline treatment; but the experiments described suggest that first the intact protein shells are formed, and they then dissociate into particles of smaller size.

This sequence of events, as well as other aspects of the reaction, are being studied in detail, and I also hope to carry out a complete characterization of both proteins described.

I am indebted to Prof. H. Veldstra for his interest and encouragement, to Miss C. Houwing for her assistance and to the Rheumathology Department and the Medical Chemistry Department of the University Hospital for putting their Spinco model *E* ultracentrifuge and the micro-electrophoresis apparatus at my disposal.

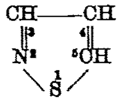
SULPHASOMIZOLE (5-*p*-AMINOBENZENESULPHONAMIDO-3-METHYL*ISO*THIAZOLE): A NEW ANTIBACTERIAL SULPHONAMIDE

By A. ADAMS, W. A. FREEMAN, A. HOLLAND, D. HOSSACK, J. INGLIS,
MISS J. PARKINSON, H. W. READING, K. RIVETT, R. SLACK,
R. SUTHERLAND and R. WIEN

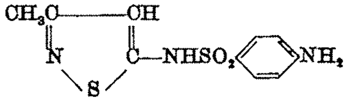
Research Laboratories, May and Baker, Ltd., Dagenham, Essex

THE development of a controlled antibiotic policy, primarily to curb the spread of resistant strains of *Staphylococcus aureus*[1], has led to a renewed interest in sulphonamide therapy. Additional stimulus has also been provided by the introduction of the 'long-acting' sulphonamides, the main advantage of which is probably convenience of administration. The prolonged action of these new products may be attributable to differences in metabolic pathways brought about by differences in substitution in the heterocyclic moieties attached to the N^1 position of the classical structural types. The compounds of this class that have been used clinically during the past few years have all conformed to a traditional chemical pattern, their duration of action and rate of excretion being varied by variation of substituents in known heterocyclic nuclei.

Against this background, it is pertinent to report a new departure in sulphonamide research, in which a hitherto unknown heterocyclic nucleus—*iso*thiazole (I)—has been introduced. The full consequences of this development remain to be worked out, but sufficient work has been completed to show that this new sulphonamide, 5-*p*-aminobenzenesulphonamido-3-methyl*iso*thiazole (the name sulphasomizole has been approved by the British Pharmacopœia Commission), is of considerable interest.



(I)

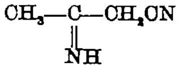


Sulphasomizole

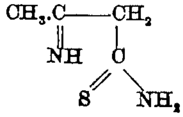
When our work began, we had no experimental evidence that the *iso*thiazole nucleus (I) could exist, but the system had long been of theoretical interest to us because of the similarity between —S— and —CH = CH— in aromatic structures. Thus, the new parent compound should resemble pyridine in many of its chemical properties[2].

We have synthesized mononuclear *iso*thiazoles by two distinct routes. The first involved the oxidation of 5-aminobenz-1,2-*iso*thiazole to *iso*thiazole-4,5-dicarboxylic acid[3], from which 4-*p*-aminobenzenesulphonamido*iso*thiazole was eventually prepared. This compound showed high activity against streptococcal and staphylococcal infections in mice, and the results stimulated us to devise a simpler synthesis of a related 5-sulphonamide.

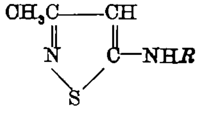
Treatment of β-imino-*n*-butyronitrile (II) with hydrogen sulphide gave β-iminothio-*n*-butyramide (III)[4], which was oxidized by a variety of reagents to 5-amino-3-methyl*iso*thiazole (IV : R = H)[5].



(II)



(III)



(IV)

The amine is a valuable intermediate for the preparation of many mononuclear *iso*thiazoles, and more than fifty derivatives of *iso*thiazole have been made[6]. One of the most interesting from the biological point of view is 5-*p*-aminobenzenesulphonamido-3-methyl*iso*thiazole (IV : $R = SO_2.C_6H_4.NH_2$-*p*)[5], a sulphonamide of high solubility in water (*p*H 6·0, 248 mgm./100 ml.; *p*H 7·0, 2,260 mgm./100 ml.) from which almost neutral, concentrated (more than 50 per cent w/v) aqueous solutions of the corresponding sodium salt can easily be made.

The antibacterial properties of sulphasomizole have been determined by carrying out *in vitro* tests in a synthetic medium similar to that described by Wilson[7]. Aqueous solutions of sodium sulphasomizole were used for these tests. After infection of the medium with a standardized inoculum and incubation at 37° C. for 24 hr., the minimal inhibitory concentrations were recorded.

The organisms included the following: *Staphylococcus aureus* (5 strains), *Streptococcus pyogenes* (2 strains), *Str. agalactiae*, *Str. dysgalactiae*, *Str. uberis*, *Str. pneumoniae*, *Str. equi*, *Str. viridans*, *Str. faecalis* (2 strains), *Alkaligenes faecalis*, *Aerobacter aerogenes* (2 strains), *Escherichia coli* (7 strains), *Klebsiella pneumoniae*, *Proteus vulgaris* (2 strains), *Pseudomonas pyocyanea* (2 strains), *Shigella flexneri*, *Shig. sonnei* (2 strains), *Salmonella typhi* (Rawlings), *S. paratyphi* B, *S. gallinarum*, *S. pullorum*, *S. typhi-murium*, *S. cholerae-suis*, *S. abortus-equi*, *Corynebacterium pyogenes*, *Haemophilus gallinarum*, *Pasteurella septica*

and *Brucella abortus*. Sulphasomizole was active against most of this wide range of Gram-positive and -negative organisms, with the exception of one strain of each of the following organisms: *Str. faecalis*, *Aerobacter aerogenes*, *Shigella sonnei*, *Pasteurella septica*, and two strains of *Escherichia coli*; but other reference sulphonamides, tested under the same conditions, also did not show any activity against these particular strains.

Experiments were carried out in mice infected intraperitoneally with either *Str. pyogenes*, *Str. pneumoniae*, *Staph. aureus*, or *E. coli*. Sulphasomizole was given either by stomach tube at 1, 5, 24, 48 and 72 hr., or graded concentrations were mixed in the diet and fed from one day before to three days after infection. Interpretation of the results was based on two criteria: (1) determination of the median effective dose, from the survival-rates, and (2) the mean effective blood concentration (the concentration of the sulphonamide in the blood necessary for 50 per cent protection of infected mice)[8,9]. Sulphasomizole showed good activity against these experimental infections, and in general appeared as active as the sulphonamides in current use.

The absorption of sulphasomizole into the blood and cerebrospinal fluid, its distribution in the tissues and excretion in the urine were determined in several species. Estimations of the sulphonamide were made by the Bratton–Marshall method[10]. The sulphonamide was given orally or subcutaneously (as the sodium salt). After oral administration to mice, rats and rabbits, it was well absorbed in doses up to 0·5 gm./kgm., and high concentrations of unconjugated drug were produced within half to 1 hr. (It should be emphasized that the term 'unconjugated' refers to the diazotizable material detected by the Bratton–Marshall method before hydrolysis, whereas the term 'conjugated' refers to the extra diazotizable material found after acid hydrolysis. Koechlin, Kern and Engelberg[11] prefer the terms 'directly' and 'indirectly' reacting.) The pattern of the blood concentration curves showed that the drug did not disappear rapidly from the circulation, appreciable amounts being present up to 24 hr. after administration; about 35 per cent was conjugated in the blood.

The sulphonamide was freely distributed in the tissues in rabbits. After an oral dose of 0·5 gm./kgm., maximum concentrations were found in the liver, lung, and spleen within about 2 hr., and at about 4 hr. in the kidney. In pregnant rabbits, sulphasomizole passed freely into the fœtus, and in lactating rabbits, into the milk.

Some information on the blood concentrations in man was obtained from three male volunteers and two patients. A single oral dose of 1 gm. in volunteers produced a maximum blood concentration of about 7·5 mgm./100 ml. within 4 hr., which fell only slightly by 6 hr. and had fallen to 2·0 mgm./100 ml. by 24 hr. About 40–50 per cent of the dose was recovered from the urine in 24 hr. In two patients each given 2 gm. of the sodium salt intramuscularly, the blood concentrations were 11·25 and 20·5 mgm./100 ml. (unconjugated and conjugated drug, respectively) in one patient after 9 hr., and in the other patient 15·7 and 27·2 mgm./100 ml. after 12 hr. These levels were amply maintained by repeated doses of 1 gm. at 12-hourly intervals.

In rats, after a single oral dose of 0·5 gm./kgm., about 25 per cent (of which 70 per cent was in the unconjugated form) was excreted in the urine during the first 24 hr. Excretion from rabbits was a little more rapid, about 35 per cent (of which 50 per cent was unconjugated) being found in the urine during the same period after an oral dose of 0·5 gm./kgm.

Sulphasomizole appeared in the cerebrospinal fluid of rabbits after oral administration of 0·5 gm./kgm. and the concentrations, relative to those found in the blood, were about 10 per cent. Intravenous injection of 0·2 gm./kgm., as a solution of the sodium salt, produced relatively high concentrations in the cerebrospinal fluid, about 85 per cent of the concentration in the blood. The difference between these two results is not fully understood.

Up to the present, we have only examined the concentration of free sulphonamide in the cerebrospinal fluid of one human patient suffering from meningococcal meningitis (James, E., Shiel, M., and Ardley, D. G., personal communication). 9 hr. after 2·0 gm. given intramuscularly as the sodium salt, the concentration in the cerebrospinal fluid was 1·85 mgm./100 ml. (16·5 per cent of the blood concentration). Two days later, after another four intramuscular injections, each of 1 gm., had been given, the concentration in the cerebrospinal fluid was 3·25 mgm./100 ml. 5 hr. after the last dose (17·2 per cent of the blood concentration).

In toxicity experiments, no deleterious effects were observed on the growth-rate of young rats or on the blood picture of guinea pigs, after daily oral doses of 0·5 gm./kgm. for several weeks. There was no significant crystalluria, even though the acetyl derivative of sulphasomizole is only sparingly soluble in water. Metabolic studies are being made to determine the nature of the urinary excretion products, and we have obtained some indication, in rats, that there is a marked increase in excretion of glycuronic acid, and a smaller increase in excretion of ethereal sulphate after continued administration of the sulphonamide.

Intramuscular injections of aqueous solutions of the sodium salt in concentrations as high as 20 per cent w/v are well tolerated in rats; 5 per cent w/v solutions have no deleterious effect when instilled into the conjunctival sac of the rabbit's eye.

To sum up, this new sulphonamide has the attributes of a useful therapeutic agent. It possesses a good all-round antibacterial spectrum and is well absorbed and distributed in the body. It is readily excreted in the urine and animal experiments indicate that it does not produce crystalluria even in high dosage. The sodium salt is highly soluble in water and well tolerated on injection. Further experimental information will be published elsewhere.

Clinical studies of the new sulphonamide are in progress.

We wish to thank Drs. E. James and M. Shiel of the Rush Green Hospital for the opportunity of estimating blood concentrations of this new sulphonamide in two patients.

LETTERS TO THE EDITORS

PHYSICS

Detection of Recently Produced Fission Products in the Atmosphere

We have been investigating in some detail the trend in fission product-levels of surface air sampled at our laboratory site at Sutton, Surrey, since May 1959. Recently, we detected a sharp increase in the levels of activity, and evidence is presented here which suggests that this was due to the first nuclear weapon test in the Sahara.

The levels of atmospheric radioactivity have been studied by measurements made on dust collected from the air by three systems: (1) a small electrostatic precipitator; (2) a large electrostatic precipitator; (3) a membrane filter assembly. The results of some of our counting measurements are shown in Fig. 1. It will be seen that the increase in activity was pronounced, but transitory, occurring some time during February 28–March 1, 1960.

The activities of the small electrostatic precipitator and the membrane filter assembly samples were measured by β-counting and in Fig. 2 the decay of small electrostatic precipitator sample 83 (February 24–March 1, 1960) is shown. The initial rapid decay is due to daughter nuclei of naturally occurring radon and thoron. After this initial decay, a half-life of 9–12 days is observed for the next 6 days, after which the curve tends to flatten out.

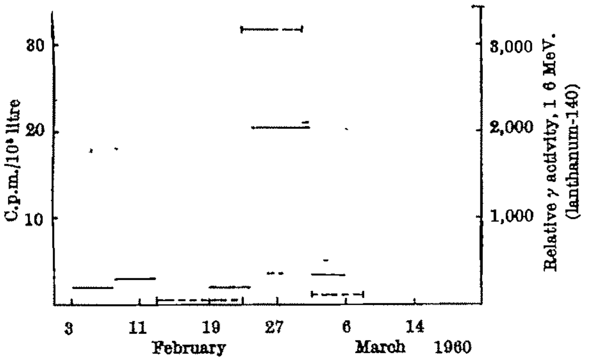

Fig. 1. Counting-rate from three sets of dust samples showing rise between February 28 and March 1, 1960. Horizontal lines indicate period of collection. Membrane filter, ... (left-hand scale); small electrostatic precipitator, ——— (left-hand scale); large electrostatic precipitator, — — · (right-hand scale)

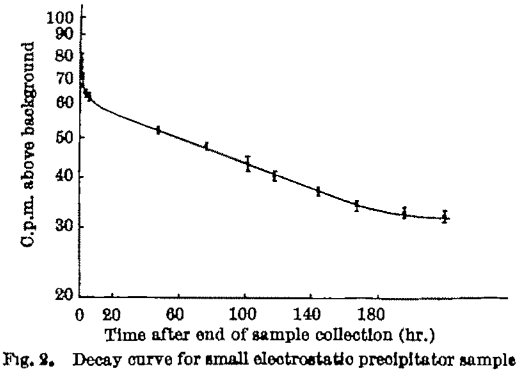

Fig. 2. Decay curve for small electrostatic precipitator sample 83

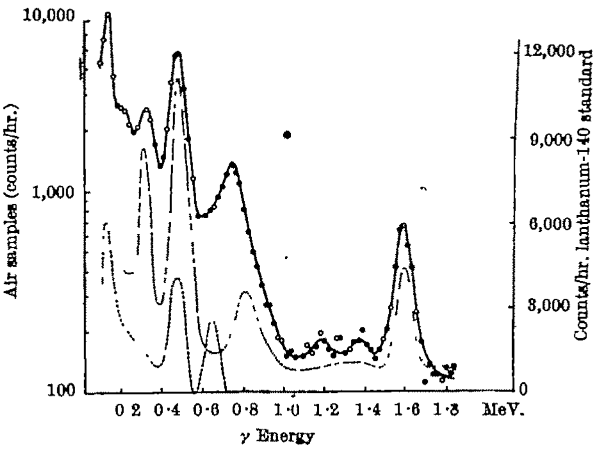

Fig. 3. Gamma-scintillation spectra showing large electrostatic precipitator samples 11(– – – –) and 12 (—○—○) compared with the spectrum of lanthanum-140 (. . . . .)

Fig. 3 shows a γ-spectrum of large electrostatic precipitator sample 12, collected over the period of increased activity, together with a spectrum of large electrostatic precipitator sample 11 taken during the preceding 10 days. The spectrum of a standard source of barium-140 plus lanthanum-140 is also shown. It will be seen that the spectrum of our standard has four prominent peaks[1] and that three of these appear in the spectrum of sample 12. The peak at about 750 keV. is probably due to zirconium-95 plus niobium-95 which would mask the lanthanum-140 line at 815 keV.

If this material is assumed to have come from the nuclear test on February 13, 1960, this would mean that our first measurements were made 20 days after fission. The principal fission products at that time are barium-140, lanthanum-140 and praesodymium-143, which decay with half-lives around 13 days, and cerium-141, with a half-life of 32 days[2]. The decay curve shown in Fig. 2 is very close to that to be expected from such a mixture of activities. Further, the principal γ-lines above 200 keV. will be those due to lanthanum-140, zirconium-95 and ruthenium-103. Energies corresponding to the first two of these nuclides are present in the spectrum of sample 12. The lines of ruthenium-103 would be masked by those of the lanthanum-140 spectrum. These two main lines of evidence combine to demonstrate the occurrence of recently produced fission products in the atmosphere, and it appears likely that these were derived from the French nuclear test.

The concentration of lanthanum-140 in the air was estimated to be 2×10^{-16} c./litre, averaged over the two-day period during which the increase in activity occurred (maximum permissible concentration for a life-time irradiation of occupationally exposed workers, 5×10^{-11} c./litre)[3]. From the known fission yields[2], the concentration of other nuclides can then be estimated. For example, the iodine-131 level would be about 1×10^{-16} c./litre on the same date. There are in all about ten nuclides with activity of the same order of magnitude at this time, so that the total activity would not be expected to exceed 2×10^{-15} c./litre. It is apparent that though detectable, at this site, none of the nuclides was present at a level having biological significance.

We wish to express our thanks to Prof. W. V. Mayneord, in whose Department the work was carried out, for his help and guidance.

Radioactivity of the Atmosphere due to Distant Nuclear Test Explosions

The programme at Harwell of rain-water collection and analysis for nuclear debris has been reported by Stewart *et al.*[1-3] and by Crooks *et al.*[4]. In conjunction with this programme, samples of radioactive dust are collected from the atmosphere using aircraft of the Royal Air Force. Similar sampling programmes using aircraft have been reported[5] from the United States, Norway and Sweden.

The dust samples are collected in filters of esparto fibre mounted in holders such that forward movement of the aircraft forces air through the filter. Measurements have been made of the concentration in air of fission-product activities at an altitude of 47,000 ft. in the lower stratosphere and in a composite sample taken between 1,700 and 18,000 ft. in the troposphere.

The filters are analysed for cæsium-137 (30-year) and zirconium-95 (65-day) by a γ-ray spectrometer using a crystal of sodium iodide (3 in. by 3 in. diameter), adequate shielding and a multi-channel pulse analyser. The uncertainty in a single analysis is usually less than 10 per cent provided that, in the case of cæsium-137, the ratio zirconium-95/cæsium-137 is less than 1. If necessary, the samples are allowed to decay before the final determination of cæsium-137.

The stratospheric samples are collected with disk filters (area 45 cm.^{2}) through which the air-flow is measured by an orifice plate assembly and pressure gauges. Typically, about 20 kgm. of air passes through the filter during a flight of 1 hr. between latitudes 50° N. and 56° N. above the United Kingdom. The results of sampling at 47,000 ft. between 1957 and 1959 are expressed in Fig. 1 as the concentration of cæsium-137 in μμc./kgm. of air and also as the ratio of concentrations, zirconium-95/cæsium-137. The collection efficiency of the filters measured at this altitude is nearly 100 per cent. The separate analyses of samples (about 6 per month) are combined to provide a mean monthly concentration.

The concentration of activity in the troposphere is much lower, in accordance with the steep gradient of fission product activity in the atmosphere[1]. In this case samples are collected in cylindrical filters (area 300 cm.^{2}) through which the airflow is measured indirectly. About 1,600 kgm. of air passes through the filter in a flight of 9 hr. along a track over the eastern Atlantic between latitudes 42° N. and 65° N. The flight plan produces a composite tropospheric sample of effective altitude ~4,000 ft. The results are presented in Fig. 2. The activity on the filter is corrected by the collection efficiency, measured in these conditions to be 85 per cent. The monthly concentration plotted is the mean of samples from about twenty sorties.

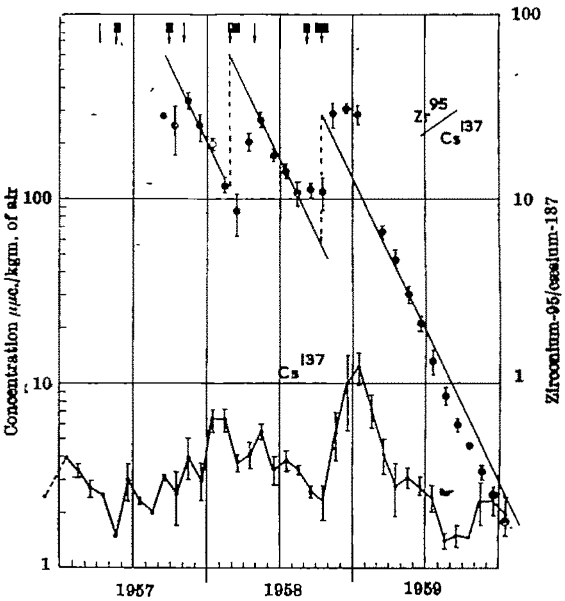

Fig. 1. Concentration of cæsium-137 and zirconium-95 in the lower stratosphere (altitude 47,000 ft.)

A simple calendar of nuclear test explosions has been fitted to both figures. This has been drawn mainly from results published by Harris[6] and is restricted to explosions of high yield (megaton). It should be recognized that explosions of low yield (kilotons) occurred frequently at other times.

The following observations are based upon deductions from the evidence of Figs. 1 and 2.

The concentration of cæsium-137 in the troposphere follows a seasonal variation, exhibiting peaks in the spring, about May, and troughs in the autumn. This is similar to the effect observed in rain-water by

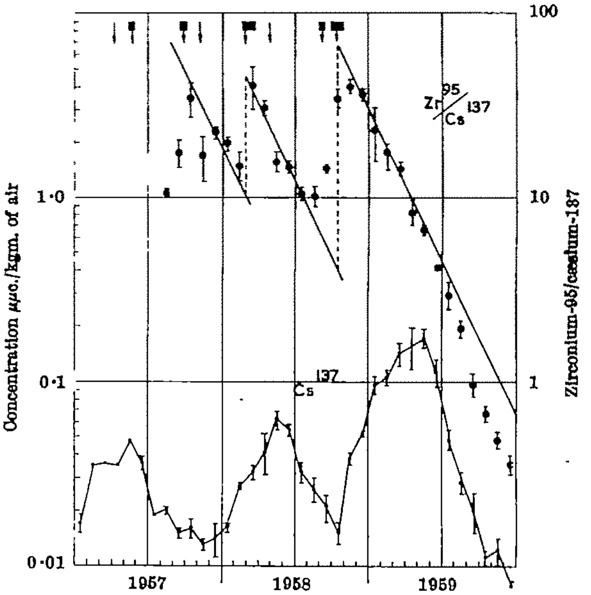

Fig. 2. Concentration of cæsium-137 and zirconium-95 in the troposphere (effective altitude ~ 4,000 ft.)

Stewart *et al.*[2,3]. On the other hand, the record of cæsium-137 concentration in the lower stratosphere (Fig. 1) does not follow the same seasonal variation. During 1957–59 a peak appears in January that may represent a seasonal movement of debris injected in the preceding months.

The ratio zirconium-95/cæsium-137 is a useful index of the age or origin of the mixture of fission products. Within a few months after a new series of test explosions the disturbed conditions are followed by a 'settled period' during which this ratio decays fairly regularly. In some settled periods this decay-rate corresponds to the radioactive half-life of zirconium-95 (65 days), as drawn in the diagrams. Such correspondence implies good mixing, in the regions of sampling, of new fission products from the recent explosions with those from previous explosions, that is, samples are taken from a source of radioactive material that is supplied in constant proportions from the 'reservoirs' of new and old debris.

The proportion of new activity may be calculated from the isotope ratios. For example, during January–June 1959 the proportion of activity in the troposphere due to explosions of autumn 1958 was about 45 per cent. This estimate is to be compared with ~60 per cent derived from the ratios strontium-89/strontium-90 in rain-water at Milford Haven[4] and with 40–50 per cent calculated by Ambrosen[7] for rain-water in Denmark. Departure of the plotted ratios zirconium-95/cæsium-137 after mid-1959 from the earlier line of decay (Fig. 2) corresponds to a reduction in this proportion, that is, to a relative increase in the rate of supply of old debris.

The debris sampled in the lower stratosphere after the autumn 1958 explosions shows evidence (Fig. 1) of good mixing in the second half of 1959. Previously in 1959 the behaviour of the zirconium-95/cæsium-137 ratios is again consistent with a relative increase in the rate of supply of old radioactivity.

Differences between the troposphere and lower stratosphere in the durations of the settled periods and the values of zirconium-95/cæsium-137 are significant. The explosions of autumn 1958 have in the latitudes of the United Kingdom produced a proportionately larger increase in the activity in the troposphere than in the lower stratosphere. This is contrary to the situation in the summer of 1958. In the latitudes of the United Kingdom the two regions of the atmosphere have maintained separate identities, as defined by the ratio zirconium-95/cæsium-137 during 1959.

A fuller account and discussion of the concentration of activity in air and rain-water will be published later.

Isotopic Composition of Potassium

Recent measurements[1–6] of the natural isotopic composition of potassium have yielded values for the potassium-39/potassium-41 ratio ranging from 13·48 ± 0·07 (Nier) to 13·96 ± 0·05 (Omura and Morito). These results are not inconsistent with the presence of variations of 1 or 2 per cent in the potassium-39/potassium-41 ratio for different samples. Earlier measurements, many of which have been summarized by Reuterswärd[3], cover an even wider range, and include numerous reports[7–12] of differences of 1 per cent or more between the potassium-39/potassium-41 ratios of minerals, normal and cancerous human tissues, and other biological samples. More recently, Voshage and Hintenberger[13] have shown that potassium of abnormal isotopic composition can be produced naturally as a result of the action of cosmic rays on iron meteorites.

The ratio potassium-41/potassium-40 was measured by Nier[1] for a sample of mineral origin and found to be 578 ± 6. Subsequent measurements on other mineral samples have agreed with this figure within 1 or 2 per cent. Fenn *et al.*[14] have reported a difference of approximately 2 per cent in the specific radioactivity of potassium salts from mineral and biological sources. This implies a corresponding difference in the relative isotopic abundance of the radioactive isotope potassium-40. However, other workers[15,16] using a similar technique have found no significant differences between the specific radioactivities of potassium salts separated from various mineral and biological materials.

This communication describes a survey of the isotopic composition of potassium in natural samples. The survey was carried out in two parts. In the first, fifty potassium-39/potassium-41 analyses were made on twenty-seven different samples; in the second, twenty potassium-41/potassium-40 analyses were made on fifteen different samples. Each group of samples included minerals (among them two microclines giving anomalous potassium–argon ages), normal and cancerous human tissues, embryonic tissue, Indian Ocean sea water, two tektites (australites) and one plant sample (*Scaevola spinescens*). Extensive tests were carried out to eliminate sources of experimental error and to establish accurately the probable errors due to the remaining random effects.

Isotopic analyses were carried out with a 60-degree, first-order single-focusing mass spectrometer with a 14-cm. ion path radius. Features of the instrument were the use of a new type of single-filament ion source[17] allowing accurate comparison of isotope ratios, use of dual ion-current collectors and amplifiers[18], and the stabilization of potassium-39 ion currents to allow more accurate measurement of the potassium-40 ion currents[19]. A rotating source assembly allowed rapid interchange of ion sources without changing the vacuum conditions or the adjustment of the ion gun. Chemical separation of the potassium as the tetraphenylboron salt was carried out for each sample, this being converted to the nitrate before analysis.

The repeatability of the results was obtained by repeated analysis of samples from a homogeneous standard material (potassium nitrate, the potassium originating from the Stassfurt sylvine deposit). The probable error for any single analysis was close to 0·3 per cent for potassium-39/potassium-41 ratios, and 0·7 per cent for potassium-41/potassium-40 ratios.

Investigations were carried out on the effects of gas scatter, non-linearity and temperature sensitivity of the measuring circuits, secondary electron emission from the collectors, ion reflexion from the collectors, stray magnetic fields in the source region, and other factors. In no case did the necessary correction to the potassium-39/potassium-41 ratio exceed 1 part in 1,000.

Tests to determine the effects of impurities in the sample materials showed that, if analyses had been carried out without any chemical purification of the samples, the potassium-39/potassium-41 ratios would have been subject to systematic errors ranging up to 3 per cent. Errors of this magnitude were associated with sample solutions in which only a few per cent of the total number of cations in each sample were potassium ions. A somewhat similar effect has been reported by Reutersward[3]. The mechanism of the effect has not yet been definitely established.

Tests to establish the degree to which samples were contaminated by 'normal' potassium were carried out using synthetic control samples of anomalous potassium-39/potassium-41 ratio. Contamination effects were proved to be negligible in all stages of the chemical treatments and in the actual isotopic analysis.

The overall distributions of results for both groups of samples were similar to the random distributions obtained by repeated analysis of the standard KNO_3. None of the samples showed a significant difference in either potassium-39/potassium-41 or potassium-41/potassium-40 ratio relative to the standard. It follows that the assumption of constant potassium-40 relative abundance, widely employed in the application of the potassium–argon dating method, is probably valid within very small limits, at least in the case of terrestrial samples. The normal isotopic composition of the australites shows that there is no significant age difference between the potassium from these and terrestrial sources. The normal potassium-39/potassium-41 and potassium-41/potassium-40 ratios obtained for human tissue suggest that claims of abnormal radioactivity of potassium from organic sources may be due to the presence of impurities in the sample materials.

The systematic errors which can apparently arise from the analysis by solid source techniques of samples containing large quantities of impurities may explain many of the previous reports of significant variations in the potassium-39/potassium-41 ratio of natural potassium.

The values obtained for the mean ratios potassium-39/potassium-41 and potassium-41/potassium-40 in the ion beams reaching the mass spectrometer ion collectors from the standard samples were 13·77 ± 0·03 and 576 ± 3 respectively. The quoted errors are probable errors.

It must be noted that mean ion current ratios, although usually assumed equal to the ratios in the sample material, are not absolute ratios. They include the effects of all systematic errors occurring up to the time of arrival of the ions at the collectors. Such errors can only be definitely established by calibrating the instrument with a sample of known isotopic composition. To eliminate all possible sources of error, the calibration sample must be in the same chemical form and of almost the same isotopic composition as the sample materials. No mass spectrometer appears to have been calibrated for potassium in this way, although a calibration with a synthetic argon isotope mixture has been made by Nier[1].

The availability and cost of separated potassium isotopes of high purity are now such that there must be several laboratories in a position to attempt absolute determinations of the isotopic composition of potassium. Existing instruments could be calibrated with accurately prepared gravimetric mixtures of separated isotopes in approximately normal proportions and used to obtain the absolute isotopic abundance ratios. Laboratory potassium salts, in view of the apparent constancy of the isotopic composition of potassium, could then be generally used for the calibration of mass spectrometers and for the measurement of absolute values of isotopic fractionation effects in the various types of ion sources. Such measurements could be expected to contribute substantially towards a better understanding of surface ionization phenomena.

Thanks are due to the many persons who assisted with the collection, identification and preparation of the samples. Prof. C. J. Birkett Clews and Dr. P. M. Jeffery are thanked for their guidance and encouragement. The work was supported by the New South Wales State Cancer Council, Dr. K. W. Starr, the University of Western Australia Research Grants Committee and the Australian Atomic Energy Commission, to which I am also indebted for a Postgraduate Research Studentship.

Electron Spin Resonance in Hydrogen Peroxide – Water Solutions at 90° K. irradiated with Ultra-Violet Light

ELECTRON spin resonance measurements have been made on ultra-violet irradiated hydrogen peroxide – water solutions. The electron spin resonance spectrometer works at 9·35 kMc./s. and uses a conventional phase-sensitive detector system, with a field modulation frequency of 280 c./s.

The hydrogen peroxide – water solutions were frozen at 90° K. in quartz tubes. Solutions of concentrations 46–87 per cent w/w hydrogen peroxide

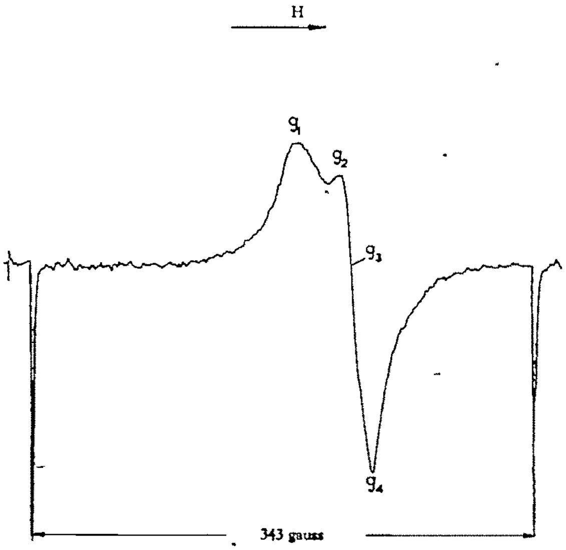

Fig. 1. Primary radical produced by ultra-violet on 87 per cent hydrogen peroxide at 90° K.

formed transparent glasses without much cracking. They were then irradiated for several hours using a Hanovia mercury vapour lamp. The ultra-violet light was filtered by the 'Pyrex' glass Dewar holding the frozen samples so that only wave-lengths longer than approximately 3000 Å. were transmitted.

The samples were quickly transferred to the spectrometer cavity (also at 90° K.) so that no warm-up took place. They then gave the spectrum shown in Fig. 1. The shape of the spectrum is very nearly the same for all the solution concentrations tested —46, 61, 78 and 87 per cent w/w. The g-values for the various points of the spectrum of this 'primary' free radical are given in Table 1. The samples were then warmed up by transferring them to a copper block maintained at a given temperature, storing them there for 5 min., and then returning them to the cavity, which was kept at 90° K. This process was repeated many times for the same samples, raising the temperature of the copper block between each step. On warming to temperatures above 130° K., the primary free radical is converted to another 'secondary' free radical. The spectrum for this radical is shown in Fig. 2. The conversion of the primary radical to this secondary radical is shown in Fig. 3, where $\frac{n_2}{n_1+n_2}$ and n_1+n_2 are plotted against warm-up temperature (n_1 is number of radicals of primary species and n_2 is number of radicals of secondary species). The ratios $\frac{n_2}{n_1+n_2}$ were calculated from the relative heights of the peaks g_1 and g_2 in the various spectra. It is seen from Fig. 3 that radical destruction takes place over the same range of temperature as that in which primary radicals are converted to secondary radicals. Measurements of the temperature for $\frac{n_2}{n_1+n_2} = 0·5$ show that this is 130 ± 5° K. for the four solution concentrations tested. The g-values of the various points of the secondary radical are also given in Table 1. The spectrum of the secondary radical shows the g-value anisotropic shape predicted by Searl *et al.*[1] for a polycrystalline sample containing axially symmetric crystals, and which identifies g_1 as $g_{\parallel}$ and g_4 as $g_{\perp}$. The spectrum also shows hyperfine splitting of amount 11 ± 2 gauss on the g_1 and g_4 peaks.

Table 1

Species	g_1	g_2	g_3	g_4
Primary	2·0375 ± 0·0008	2·0165 ± 0·0004	2·0105 ± 0·0004	2·0007 ± 0·0004
Secondary	2·0295 ± 0·0010	2·0128 ± 0·0004	2·0096 ± 0·0004	2·0084 ± 0·0004

The occurrence of two separate radicals under these conditions does not appear to have been reported before. Electron spin resonance spectra have been recorded by Kaitmazov *et al.*[2] from ultra-violet irradiation of hydrogen peroxide – water solutions at 77° K. without warming the sample above this temperature. They found a spectrum which showed

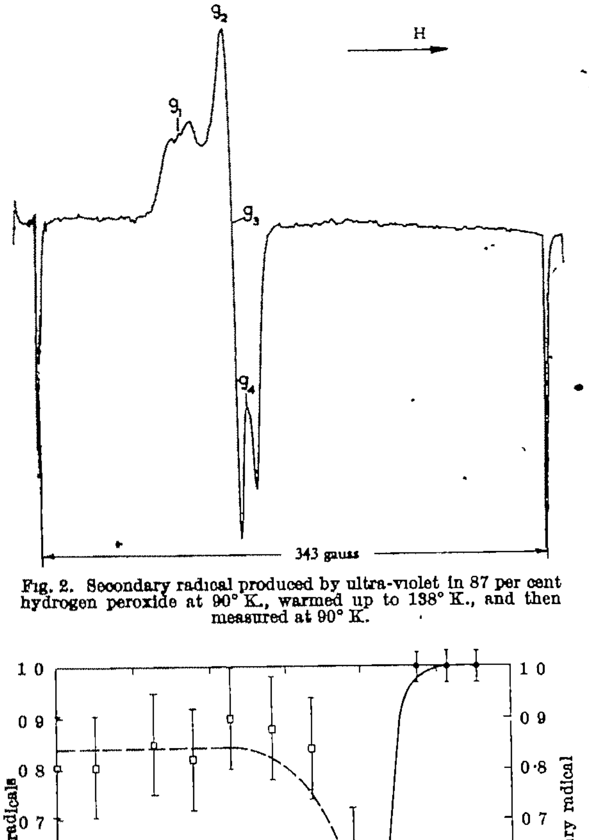

Fig. 2. Secondary radical produced by ultra-violet in 87 per cent hydrogen peroxide at 90° K., warmed up to 138° K., and then measured at 90° K.

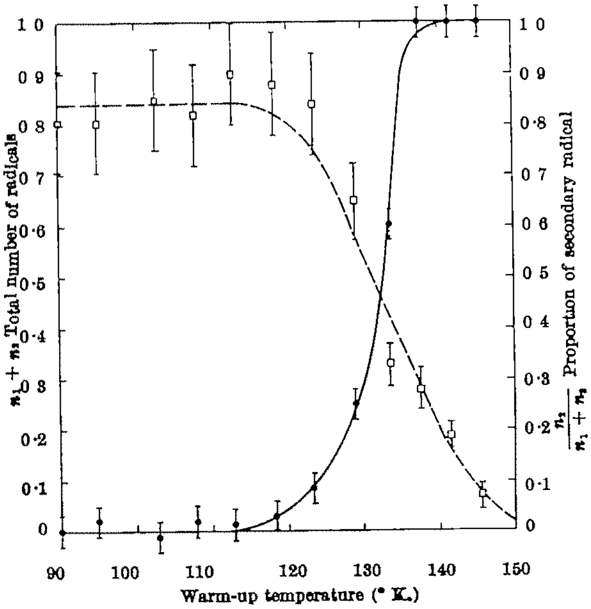

Fig. 3. Plot of $\frac{n_2}{n_1+n_2}$ (●) and $n_1 + n_2$ (□) against temperature of warm-up for 87 per cent hydrogen peroxide

the same g-values as the primary radical above, but which also showed a hyperfine splitting of 12 gauss on the g_4 peak. It therefore appears that their samples contained a mixture of the primary and secondary radicals with the primary radical predominating. The discrepancy between their spectrum and that of Fig. 1 might be explained if Kaitmazov *et al.* used ultra-violet wave-lengths shorter than 3000 Å. Hodgson *et al.*[3] also performed electron spin resonance measurements on a 40 per cent solution irradiated at 77° K. with 2537 Å. ultra-violet; but the resolution obtained was not good enough for comparison with the above measurements. It is also quite likely that the spectrum for the primary radical (Fig. 1) contains a small amount of secondary radical spectrum, and this might account for the g_2 shoulder. The secondary radical spectrum has been reported before by Gorbanev *et al.*[4] and also by Ghormley *et al.*[5], using the method of dissociation of hydrogen peroxide and water in an electrical discharge and freezing the products at 77° K. The spectrum shown in Fig. 2 is in agreement with these measurements; in particular Ghormley *et al.* quote $g_1 = 2{\cdot}027$, $g_2 = 2{\cdot}0085$, which agree within experimental error with the values given in Table 1. We have also performed similar discharge experiments and obtained agreement with the secondary radical.

Further experiments are now being performed in order to obtain more information on these two radicals, and the results of these measurements will be published in due course. It is hoped that this information will be sufficient to identify the radicals.

The hydrogen peroxide for these measurements was kindly supplied to us by Laporte Chemicals, Ltd. We wish also to acknowledge grants for apparatus and for one of us (R. C. S.) from the British Empire Cancer Campaign.

RADIOPHYSICS

Ionospheric Effects associated with the Solar Flare of July 10, 1959

ON July 10, 1959, the Sydney Observatory reported a class 3+ solar flare lasting from 0210 to 0410 U.T. The Cable and Wireless, Ltd., Receiving Station at Singapore also experienced a sudden fade-out of all radio circuits at 0210 U.T., the circuits not being re-established until between 0415 and 0430 U.T.

Ionospheric changes associated with the flare were observed at the Department of Scientific and Industrial Research Radio Research Substation at Singapore by using an automatic ionosonde[1]. Fig. 1 shows measured values of f_0F2 and of the lowest frequency on which reflexions were obtained from the E or the F layer (f min.), together with median values for the same parameters for control days (July 1–20). A large change in f min. occurred between 0200 and 0230 U.T., and this is in agreement with the reported time of occurrence of the flare. The changes may be compared with those observed during the solar flare of February 23, 1956[2,3].

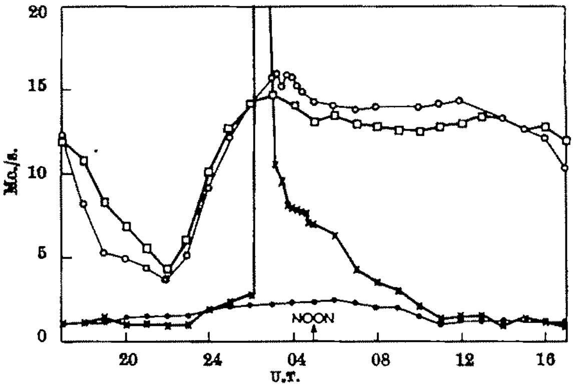

Fig. 1. Ionospheric characteristics observed on July 10, 1959, and control days. ○—○, Measured values f_0F2; ×—×, measured values f min.; □—□, median values f_0F2 for control days; ●—●, median values f min. for control days

An approximation to the increase in the electron density in the D layer has been computed from measurements of f min. and is presented in Fig. 2 as a ratio:

$$B/B_0 = (f1 + fL)^2/(f2 + fL)^2$$

where fL is the gyrofrequency around the vertical component of the geomagnetic field, $f1$ is f min. on July 10, 1959, $f2$ is f min. on control days (median).

A pulse in the measured values of f_0F2 was also observed immediately after the period of very high absorption. This pulse is similar to that studied by Minnis and Bazzard[3] and the same technique has been used to form an estimate of the amplitude of the pulse. On this occasion the best measured value of f_0F2

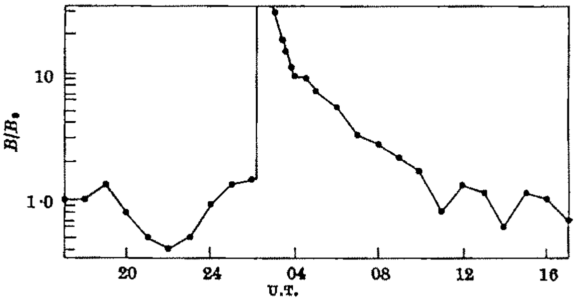

Fig. 2. Ratio of D-layer ionization on July 10, 1959, to median value of that observed on control days

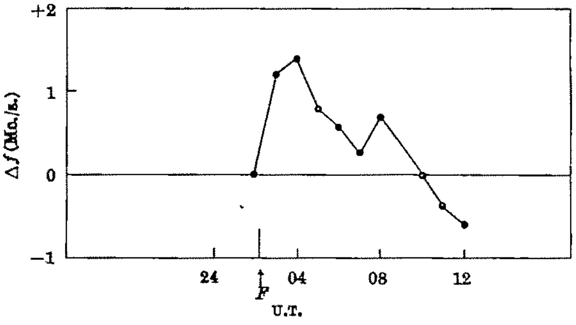

Fig. 3. Difference between measured and probable values of f_0F2 on July 10, 1959, and control days. F, Time of commencement of flare

prior to the disturbance was at 0200 U.T., and the most probable values for subsequent hours have been derived from this value and results recorded on the control days. The differences, Δf, between the measured and probable values of f_0F2 at each hour are shown in Fig. 3. The pulse reached its maximum amplitude between 0300 and 0400 U.T., the time of day in July when f_0F2 normally reaches its maximum value at Singapore.

Differences between the measured and probable values for all hours between 0200 and 1200 U.T. on each day in July have therefore been examined for similar pulses but none was found. The enhanced ionization of the $F2$ layer on July 10 can therefore reasonably be attributed to the effects of the solar flare.

The work described was carried out as part of the programme of the Radio Research Board. The work is published by permission of the Director of Radio Research of the Department of Scientific and Industrial Research.

Observations of Atmospheric Radio Noise

RECENT observations of radio noise from the upper atmosphere mainly at a frequency of 5 kc./s. have shown that it appears frequently to come from sources of limited geographical size. For example, records of the noise amplitude at places only 1,000 km. apart differ considerably in their time variations, while directional measurements of the apparent noise sources have suggested that they are sometimes as small as 500 km. in extent[1-3].

Yet, although the illumination of the Earth by this radiation in the Australian area appears to be both patchy and sporadic, its occurrence is clearly associated with world-wide disturbances of the geomagnetic field. It is therefore of some interest to examine any evidence for a world-wide noise pattern. Aarons, Gustafsson and Egeland[4] have reported observations of radio noise in the kilocycle region at Kiruna, Sweden. They detected the radiation mainly in two bands centred at about 750 c./s. and 2 5 kc./s. between the hours 0600 and 1900 G.M.T. on December 5, 1958.

Examination of routine records of radiation amplitude in the band 4 kc./s.–6 kc./s. obtained at Camden, New South Wales, has shown that following a geomagnetic sudden commencement (S.S.C.) at 0035 G.M.T., December 4, 1958, a noise storm began suddenly at 1250 G.M.T. on the same day and lasted until 2200 G.M.T. on December 5, 1958. As found on many other occasions at Camden its beginning coincided with a bay-like variation in the magnetic record. Fig. 1 shows a comparison of the Kiruna and Camden geomagnetic and noise records. The early part of the noise storm was apparently not recorded at Kiruna although this could have been due to the different recording technique used at the two places.

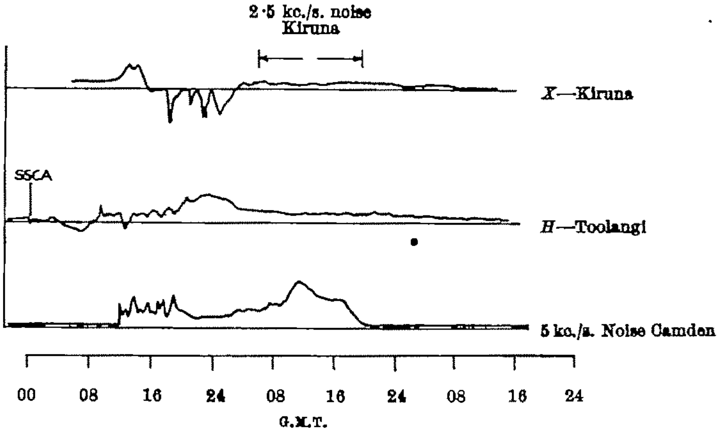

Fig. 1. Comparison of geomagnetic and very-low-frequency noise records (December 4, 1958) from Kiruna, Sweden, and Camden, New South Wales

It therefore appears likely that there is a world-wide pattern of noise illumination during geomagnetic disturbances, although more examples will be needed to confirm this. The study of this pattern may be of considerable importance because of the possibility that it represents an image of the disturbed regions of the outer atmosphere which are the sources of auroral particles. Investigations of whistling atmospherics have led to the belief that they are guided by ionization ducts in the outer atmosphere, probably lying along the geomagnetic field lines[5]. These magneto-ionic ducts will also guide any radiations in the kilocycle frequency band which are generated in the outer atmosphere and will thus project an image of the radiation sources on to the ionosphere. The radiation itself is likely to be caused by emission from fast charged particles traversing the plasma of the outer atmosphere.

Future studies of the world image at 5 kc./s. may be made either with a network of ground receivers or with satellite receivers. For an instantaneous picture, ground receivers would be necessary since a satellite takes 24 hr. to scan the whole Earth, whereas the average duration of noise bursts is only about 3 hr. Also, the geographical spacing between successive orbits is considerably greater than the scale of the fine structure of the image so far established[3]. Satellite and ground-based techniques are thus complementary and it is planned at this laboratory to make use of both.

The geomagnetic records of Toolangi Geomagnetic Observatory were supplied by the Commonwealth Bureau of Mineral Resources.

Correlation of Occurrence of Whistlers with Geomagnetic Activities

In order to study the correlation of geomagnetic activities with the frequency of occurrences of whistlers, I have investigated the I.G.Y. and I.G.C. data for 2 years, that is, July 1, 1957–June 30, 1959, at the stations Toyokawa (geogr. co-ord. 34° 50′ N., 137° 22′ E.; geomag. co-ord. 24·5°, 203·5°) and Wakkanai (geogr. co-ord. 45° 22′ N., 141° 41′ E.; geomag. co-ord. 35·3°, 206·0°) and the 3-hr. range *K* indices of Kakioka Magnetic Observatory.

To show most effectively the geomagnetically disturbed days, I have defined as 'effective *K* index' the sum of products of the *K*-indices 5, 6·5 (for 6 or 7) and 8 (for > 8) and their number of occurrences per day; the indices 5, 6 or 7 and > 8 mean moderate storm, moderate severe storm and severe storm, respectively. At first I drew a diagram showing the correlation between my 'effective *K* index' and the number of occurrences of whistlers, and found that they can be classified fairly distinctly into two groups: one belongs to the winter group, October (or November)–March (or April), where many whistlers are found every month; the other to the summer group, May–September, where smaller numbers are found. It seems that it is difficult to find a single law applicable both to winter and to summer groups.

It may be deduced that the frequency of occurrences of whistlers has a definite seasonal variation depending on thunderstorm activities, distributions of electron density and geomagnetic intensity in the exosphere and in the ionosphere due to solar activities and other yet unknown cosmic phenomena; daily variations due to effective *K* index are superposed upon this general seasonal variation. Therefore I investigated the correlation of the effective *K* index with the frequency of occurrences of whistlers observed at Wakkanai in most frequent periods, that is, during September and December 1957, January, February, March and December 1958, January, February and March 1959; Wakkanai was selected owing to remarkable occurrences of whistlers there.

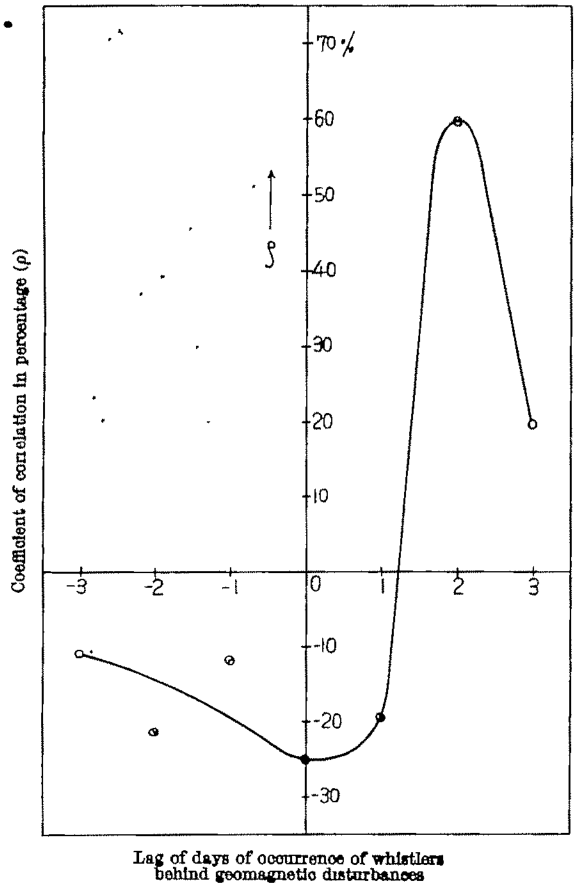

Fig. 1. Correlation between lag of occurrence of whistlers and geomagnetic disturbance

Table 1. Correlation between Lag of Occurrences of Whistlers and Geomagnetic Disturbances

Lag of days of occurrences of whistlers behind geomagnetic disturbances	−3	−2	−1	0	1	2	3
Coefficient of correlation	−0·11	−0·21	−0·12	−0·25	−0·19	+0·60	+0·20

Taking as reference disturbed days where effective *K* indices are more than 6, I investigated the correlation with the frequency of occurrences of whistlers, and found that it was most remarkable on the second day after geomagnetic disturbances; really the correlation coefficient on the second day was 0·60, as shown in Table 1, and in Fig. 1, from which I conclude that whistlers occur most frequently on the day which lags two days after geomagnetic disturbances. In the summer group the same correlation as that in the winter was not found.

GEOCHEMISTRY

Origin of Chondrules and Chondritic Meteorites

More than 90 per cent of all stony meteorites are classified as chondrites, because of the presence of chondrules—spheroidal aggregates of one or more silicates, commonly olivine and orthopyroxene. In form, texture and structure chondrules are not like any spheroidal bodies observed in terrestrial rocks, and their origin has been argued by investigators of meteorites for more than a century, without a generally accepted solution being reached. Roy[1] has recently provided an admirable summary of the hypotheses of origin. Most of these hypotheses imply that chondrules were derived originally from the crystallization of a silicate melt. These hypotheses are often linked with the generally accepted belief that these meteorites are fragments of a disrupted body of asteroidal or planetary dimensions.

I would suggest an alternative hypothesis, that the structure of chondritic meteorites is the result of reaction and recrystallization of pre-existing material essentially in the solid state, and that many, if not all, chondritic meteorites, instead of being fragments of a disrupted planet or asteroid, have always been independent and individual objects.

The pre-existing material I believe is represented by the carbonaceous chondrites, a small group (19 out of a total of about 800 chondrites), quite distinct from all other meteorites in chemical composition (they contain carbon, organic compounds, water-soluble compounds, and much combined water) and in mineralogical composition (the silicate material is largely chlorite, a hydrated magnesium–iron silicate). Chlorite decomposes on heating above about 600° C. to give olivine and orthopyroxene; if carbon is present, a natural smelting will take place, reducing some of the combined iron to metallic iron, and thereby increasing the magnesium content of the silicates. The reactions can be represented as follows:

$$\underset{\text{chlorite}}{Mg_4Fe_2Si_4O_{10}(OH)_8} \rightarrow \underset{\text{olivine}}{2(Mg,Fe)_2SiO_4} + \underset{\text{orthopyroxene}}{2(Mg,Fe)SiO_3} + 4H_2O$$

$$\big\downarrow {+2C}$$

$$4MgSiO_3 + 2Fe + 2CO_2$$

These reactions will produce the mineralogical composition of the usual chondritic meteorites, an aggregate of olivine and/or orthopyroxene, with some metallic iron. This relationship between carbonaceous chondrites and the other chondritic meteorites was pointed out by Wiik[2], who stated: "This is intended only to give a picture of the chemical relations between the subgroups, and not intended to suggest the genesis". I believe this is not only a chemical relationship but also a genetic one.

The texture and structure of the chondritic meteorites is quite remarkable if they have originated in any body with a considerable gravitational field. Many of them are very porous and friable, so much so that they can be crumbled in the hand, indicating they were not consolidated under pressure. They generally contain nickel–iron in amounts ranging from 5 to 25 per cent, this metal being intimately mixed with the low-density silicate minerals and showing no sign of gravitational segregation. Both these features are readily explicable if these meteorites are the product of chemical reconstitution of carbonaceous chondrites triggered off by heating to 600° C. or higher. A possible explanation is that carbonaceous chondrites represent aggregates of primitive cosmic dust, and that most of them have, during the course of geological time, approached sufficiently close to the Sun to be heated enough to set off the reactions converting them to olivine–pyroxene chondrites.

Suggestive evidence in favour of such an explanation is provided by the age data on chondrites. Gerling and Rik[3] have measured the ages of several chondrites by the potassium–argon method, and found them to differ one from another, ranging from 720×10^6 years up to $3,000 \times 10^6$ years. Different ages for different chondrites are to be expected on the hypothesis outlined here, since the potassium–argon age will give the time since recrystallization.

The hypothesis outlined here can be tested if we can devise methods for determining the temperature of crystallization of the minerals making up the chondrites. A few clues are already available. The St. Marks stone contains quartz, and hence its temperature of crystallization (at zero pressure) cannot have exceeded 867° C. The Indarch stone contains tridymite, which, if it crystallized within the field of stability of this mineral, implies a temperature of crystallization between 867° and 1,470° C. Other geochemical thermometers which should be investigated are: (*a*) composition relationships between olivine and co-existing pyroxene; (*b*) the nature of the plagioclase feldspar (present in small amount in most stone meteorites), whether low-temperature or high-temperature; (*c*) the nature of the nickel–iron phases—both kamacite and tænite are present in many stony meteorites, but usually as individual grains, not in Widmanstätten intergrowths. Investigations along these lines are proceeding in this Museum.

If the origin of the chondritic meteorites is that outlined above, the other meteorite types—achondrites, pallasites, and siderites—can be explained as the products of gravitational differentiation of a planetary or asteroidal body formed by the aggregation of chondrites. Such a body would probably pass through a molten stage as a result of the heat produced by aggregation, chemical reactions, and nuclear disintegrations. Given a moderate gravitational field, this would produce a silicate mantle overlying a metallic core. Subsequent disintegration would give rise to the essentially metal-free achondrites, and the silicate-free siderites, the few pallasites coming from a transition zone. In this connexion it should be noted that diamonds have been found only in siderites and achondrites, indicating that only these meteorites crystallized under sufficiently high pressures.

CHEMISTRY

Pentafluoropyridine

In two recent communications[1,2], a general method for the preparation of perfluoro-aromatic compounds was described. It involved the defluorination of saturated[2] and unsaturated[1] cyclic fluorocarbons over a metal surface at 400–600°, when the corresponding aromatic fluorocarbons were produced. For example, hexafluorobenzene was obtained[1] from octafluoro*cyclo*hexa-1 : 3- or -1 : 4-diene, and octafluoronaphthalene[2] from perfluorodecalin; several other examples were also described[2].

We now report the first synthesis of an unsaturated perfluoro-heterocyclic compound by a similar process. The starting material was undecafluoropiperidine, which was prepared by known routes—the electrochemical fluorination of either piperidine[3] or pyridine[3,4]. When passed through a heated nickel tube (2 ft. 6 in. long × 1 in. diameter) packed with nickel gauze, this gave pentafluoropyridine in moderate but significant yields. In a typical experiment, undecafluoropiperidine (3·4 gm.) was passed through the tube at 560° with a nitrogen flow-rate of 4·0 litres/hr. Gas-liquid chromatographic analysis (dinonyl phthalate/kieselguhr : nitrogen carrier gas) of the pyrolysate (2·1 gm.) showed that at least four components were present in addition to some unchanged starting material. The component with the highest retention time was separated from several combined pyrolysates (5·0 gm.) by preparative-scale gas-liquid chromatography[5] and was distilled *in vacuo* from phosphorus pentoxide to give pentafluoropyridine

(0·55 gm.), boiling point 84°, n_D^{20} 1·3834 (found: C, 35·6; C_5F_5N requires C, 35·5 per cent): mass-spectrometry, principal mass peaks: 169, C_5F_5N; 150, C_5F_4N; 138, C_4F_4N; 124, C_4F_4. The compound had $\lambda_{max.}$ at 254 mμ (ε, 2,700 in ethanol). The presence of strong bands in the infra-red spectrum at 1,650, 1,537, and 1,505 cm.$^{-1}$ was also consistent[6] with a pyridine structure, and the absence of strong bands at frequencies higher than 1,650 cm.$^{-1}$ showed that no olefinic bonds were present.

The other three components from the pyrolysis have not yet been identified, but are believed to be unsaturated.

Pentafluoropyridine is a colourless and almost odourless liquid. It is immiscible with water but miscible with organic solvents. We have been unable to detect any basic properties of the compound. A potentiometric titration in aqueous ethanol against *N*/20 acid showed no end-point. Hydrogen chloride in dry ether gave no hydrochloride, and no picrate was formed in ethanol solution. This behaviour is different from that of the primary amine pentafluoroaniline[7], which was weakly basic and formed an easily hydrolysable hydrochloride in ethereal solution. It is noteworthy that pyridine is a stronger base than aniline.

We thank Dr. J. R. Major for the mass-spectrometric results.

A Modification for washing the Benzidine Sulphate Precipitate in the Determination of Sulphate

AMONG the numerous procedures that have been developed for determining sulphate with benzidine, that reported by Kent and Whitehouse[1] is most commonly employed as a micromethod. The reliability of the method has also been confirmed by me.

In this, as in all the other procedures, difficulty is experienced in removing the excess of benzidine from the benzidine sulphate precipitate without losing any of the latter. The difficulty was previously overcome by collecting the benzidine sulphate precipitate in a porous glass filter crucible and washing the unreacted soluble benzidine thoroughly. The method yields accurate and reproducible results provided that the filter is of standard porosity and the filtering time is held constant. Owing to the difficulties associated with the use of the filter crucible, the method is, however, time-consuming.

I have developed the following procedure for washing the benzidine sulphate after its precipitation by the method of Kent and Whitehouse. The contents of the precipitation tube are transferred to a centrifuge tube of about 10-ml. capacity which tapers to a sharp point. One drop of an aqueous suspension of barium sulphate which has been carefully rinsed free of excess barium or sulphate ions is then added and it is centrifuged for 5 min. at 3,000 r.p.m. Two more drops of the barium sulphate suspension are added, and the tube centrifuged for a further 15–20 min. The upper clear layer is then removed and the mouth of the tube dried with cellulose tissue. About 9 ml. of an alcohol–acetone (1 : 1) mixture is added to the tube, and the precipitate is broken up with a stiff steel wire. The tube is centrifuged about 5 min., two drops of the barium sulphate suspension are added, and the centrifugation continued for about 10 min. It should be noted that the total amount of barium sulphate added forms a cone 1–1·5 mm. high at the bottom of the tube when tightly packed. The upper clear layer is decanted, about 9 ml. of the alcohol–acetone mixture is added and the tube is centrifuged for about 10 min. After the supernatant has again been removed, 3 ml. of *N* hydrochloric acid is added to dissolve benzidine sulphate precipitate, which is broken up with a steel wire. After ½ hr., 2 ml. of water is added to the tube, and the latter is centrifuged for 5 min. The solution containing the benzidine is transferred to another tube for diazotization by the method of Kent and Whitehouse.

The microprecipitate of benzidine sulphate is always enclosed between two tightly packed layers of barium sulphate during the decantations. After the first centrifuged precipitate has been broken up, the benzidine adsorbed on the barium sulphate is removed by washing with the alcohol–acetone mixture. After the centrifuged precipitate has been broken up a second time, the pure benzidine sulphate is dissolved in the hydrochloric acid. The solubility of barium sulphate is so slight that it cannot cause any significant error.

In spite of its apparent complexity, the method can be readily employed in routine analyses. One hundred analyses can be performed daily with a centrifuge that takes 50 tubes and a larger throughput can be achieved by using a larger centrifuge. The accuracy of the method is about the same as reported by Kent and Whitehouse. The absorbance reading for the blank is 0 020 when a Beckman *DU* spectrophotometer is employed.

Freezing-Point Depressions of Hoagland's 'Carbowax' Systems

SOLUTIONS of various osmotic pressures have been widely used in biology. Sugars and their derivatives, commonly used to maintain osmotic pressures, have the drawback that many, if not all, of these compounds can be metabolized by the test tissue or organism. McClenden and Blinks[1] described the use of 'Carbowax 4000' (polyethylene glycol) in maintaining various osmotic concentrations in a study of the Hill reaction. Excellent results were reported. This

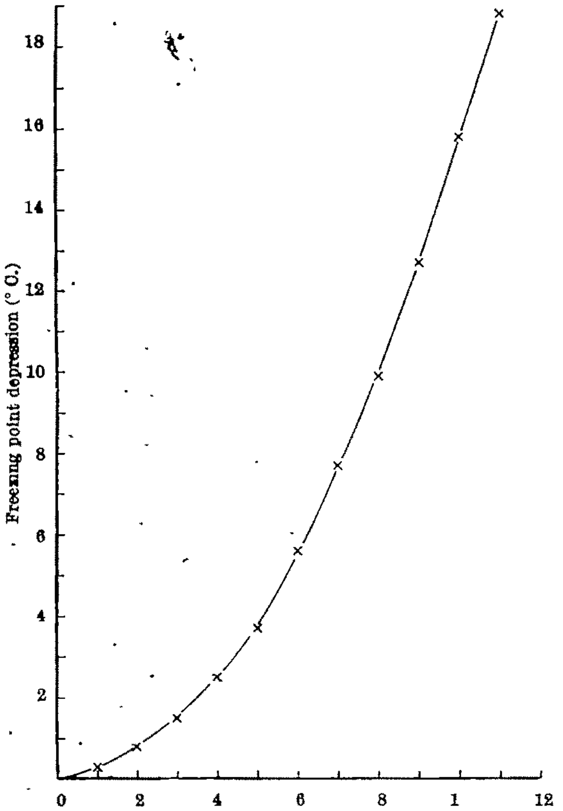

Fig. 1

laboratory has successfully used 'Carbowax 4000' in a study of water uptake by bush beans, *Phaseolus vulgaris*. We believe our results on freezing point depressions of complete Hoagland's solutions containing various concentrations of 'Carbowax 4000' may be of value to other investigators.

'Carbowax 4000' was dissolved in Hoagland's complete nutrient solution[2]. The freezing point depression was routinely checked about 24 hr. later. Solutions could be kept a week at room temperature without any effect on freezing-point depression. This lack of ageing effect agrees with the results of Couper and Eley[3]. Beckmann freezing-point apparatus was used for all determinations. For solutions containing 0–60 per cent (w/v) 'Carbowax 4000', a brine solution (−10° C.) was used to lower the temperature; for solutions containing 60–100 per cent (w/v) 'Carbowax 4000', chilled acetone (−20° C.) was used; for solutions containing 100–110 per cent (w/v) 'Carbowax 4000', acetone-dry ice (held at −30° C.) was used. The overlap between freezing solutions was used to maintain continuity.

No difference could be detected in freezing-point depressions of solutions determined in two different freezing mixtures. The results are presented in Fig. 1. It can be seen that the curve, while smooth, deviates from van't Hoff's law. The points on this curve are the result of a single run. The complete sequence was determined several times, however. The greatest deviation from the results presented here was 0·2 deg. C. From results presented here osmotic concentrations can readily be calculated. Couper and Eley[3] give results for freezing-point depressions of 'Carbowax 4000' in water.

Some New Complexes of Rhenium

No complexes with oxygen or acetylenic ligands of rhenium have been previously reported, and the only known olefin complex was prepared indirectly[1]. We have prepared acetylacetone (rhenium acetylacetonates containing other ligands have been prepared, Nyholm, R. S., personal communication), acetylene and olefin complexes by direct reaction of the ligands with various rhenium compounds.

Acetylacetone reacts on refluxing with rhenium sesquioxide or rhenium dioxide to give rhenium *tris*(acetylacetonate) (Found: C, 36·7; H, 3·7; O, 20·1; Re, 38·9 per cent; required for Re($C_{15}O_6H_{21}$): C, 36·0; H, 4·3; O, 19·7; Re, 38·3 per cent). The complex forms brown paramagnetic crystals soluble in alcohol, acetone and chloroform. Its infrared spectrum shows peaks typical of other transitional metal acetylacetonates[2]. Susceptibility measurements show that the effective magnetic moment is dependent on temperature, varying between 1·9 and 2·3 B.M. The variation is probably due to antiferromagnetic effects and the low moment is similar to that of other octahedral Re(III) complexes[3] which have been interpreted by Kotani theory[4].

Very stable monomeric, diamagnetic acetylene complexes were obtained directly from rhenium trichloride and triphenylphosphine rhenium trichloride[5], for example, phenylacetylene gave $ReCl(C_6H_5C{\equiv}CH)_2$ with the trichloride. In these compounds the triple $C{\equiv}C$ bond is reduced effectively to a double $C{=}C$ bond as shown by the shift of the C—C stretching frequency down to 1,700 cm.$^{-1}$, and the acetylene may be regarded as bonded to the metal by two σ bonds from the carbon atoms adjacent to the multiple bond, as suggested by Chatt for the platinum acetylene complexes[6].

Complexes have also been obtained from hydroxy acetylenes; thus, with but-1-yne-3-methyl-3-ol a compound of formula $ReCl(C_5H_8O)_2$ is obtained from the trichloride and $ReCl.P(C_6H_5)_3.(C_5H_8O)_2$ from triphenylphosphine rhenium trichloride. Again the bonding in these compounds is similar to that in the analogous platinum complexes in which it is thought that the acetylene acts as a bidentate ligand with bonding from both the triple bond (μ bond) and the hydroxyl oxygen[7]. The infra-red spectra of the rhenium complexes show similar shifts in both the $C{\equiv}C$ and O—H stretching frequencies to those reported for the platinum compounds[7].

Rhenium trichloride and triphenylphosphine rhenium trichloride react with olefins; thus di*cyclo*pentadiene gives $ReCl_2(C_{10}H_{12})_2$ with rhenium trichloride. This black compound is insoluble in all solvents and is probably polymeric. From triphenylphosphine rhenium trichloride a compound $ReCl[P(C_6H_5)_3](C_{10}H_{12})_2$ is obtained which is readily soluble in organic solvents.

Infra-Red Spectrum of Garnets

Regularities in the infra-red absorption spectra of silicate minerals have been pointed out by Launer[1]. Very recently, a much more detailed study of the strong absorption of the garnets in the 800–1,000 cm.$^{-1}$ range has been published by Wickersheim *et al.*[2]. My results in this field extend down to 280 cm.$^{-1}$ and may be summarized as follows.

(1) If titaniferous garnets are excepted, the general infra-red pattern is pretty uniform, irrespective of the nature of the trivalent and bivalent cations. This pattern is highly characteristic of the garnets, and has not been observed in more than a hundred other silicates so far investigated[3].

(2) The nearly linear relationship between the frequency ν of a given band and the length of the cell edge a_0, mentioned by Wickersheim[2] is verified for all the bands down to 500 cm.$^{-1}$; it does not hold, however, for the bands observed at low frequencies. This is readily explained by the fact that most of these low-frequency bands are related to metal-oxygen vibrations, their position being chiefly determined by the nature of the cation itself.

On the other hand, it should be pointed out that, for certain bands at least, the slope of the straight line ν versus a_0 is slightly but definitely different for the two principal families of garnets, namely, the pyralspite and the ugrandite series.

(3) Garnets of the pyralspite family always exhibit one or two bands of low or medium intensity in the 350–280 cm.$^{-1}$ range. These bands are either missing or extremely weak for the garnets of the ugrandite family. This is reasonably explained if these bands are assigned to metal-oxygen vibrations of the bivalent cation (Fe II, Mn II, Mg) in eight-fold co-ordination: in the ugrandite garnets, this cation is mainly calcium, and the ionic bonds Ca—O should not give rise to discrete infra-red absorption bands.

(4) Some details may be characteristic of a given type of garnet. The discussion of such details is out of place here, and will be given in a forthcoming paper.

(5) In titaniferous garnets of the melanite–schorlomite–ivaarite series, the general infra-red pattern is more or less altered, the degree of alteration being roughly proportional to the amount of titanium. In these garnets, titanium is in four-fold co-ordination (at least partly), and thus replaces silicon. This assignment has been discussed at length in a previous paper[4].

From a more theoretical point of view, the most important feature is the uniformity of the bands assigned to SiO_4 fundamental frequencies. This uniformity is somewhat surprising, as $R^{III}O_6$ octahedra and $R^{II}O_8$ dodecahedra are the nearest neighbours of the SiO_4 tetrahedra, and partial isomorphic replacement of either R^{III} or R^{II} (which always occurs in garnets) should alter the local symmetry around the SiO_4 group.

This is in contrast with the strong influence of the introduction of TiO_4 tetrahedra in the structure. This introduction does alter the infra-red pattern of the SiO_4 tetrahedra, although the TiO_4 and SiO_4 are not mutually linked.

This interesting behaviour is not restricted to the garnet type, and has been observed in other series of isomorphic orthosilicates[3].

BIOCHEMISTRY

Vitamin A_1 Aldehyde in Hen's Eggs

We have recently reported[1] that vitamin A_1 aldehyde occurs in the ripe eggs of several marine teleost fishes, and is the predominant form of vitamin A in them. In that paper we stated that we could not detect vitamin A_1 aldehyde in hen's eggs, but further experiments have shown it to be present.

Eggs from inseminated Light Sussex hens on a breeder's mash containing 2·4 mgm./kgm. of preformed vitamin A were used, the eggs being stored at 4° C. until used. The yolk was separated from the white, and extracted as previously described for fish eggs[1]. When the extract was subjected to gradient elution chromatography[1], with a large column to take 2 gm. of lipid, the fractions that might be expected to contain vitamin A_1 aldehyde gave in the Carr–Price test only a fleeting blue colour, which soon became reddish-brown. Ultra-violet absorption curves gave no definite proof of the presence of aldehyde. However, when these fractions were reduced with sodium borohydride and the product subjected to chromatography by a modification[2] of the method of Thompson, Ganguly and Kon[3], vitamin A_1 alcohol was found by the Carr–Price test to be present, and was presumably derived from vitamin A_1 aldehyde in the original extract, the calculated amount being about 11 μgm. in the whole yolk. The other lipid material in the fractions apparently interfered with the direct characterization of the aldehyde.

In herring eggs, the vitamin A_1 aldehyde is bound to a lipid and, either directly or indirectly, to protein[1]. If it were so in the yolk of hen's eggs, then by first extracting the lipids with a fat solvent without denaturing the proteins, and then denaturing them and extracting again, it might be possible to separate the aldehyde from most of the lipid. To test this possibility, each of several yolks was freeze-dried, ground to a powder and extracted with diethyl ether in a Soxhlet apparatus for 4 hr. The residue was then treated with 30 ml. water and 60 ml. ethanol and extracted with three 200 ml. lots of light petroleum in a Waring 'Blendor' under nitrogen. The two extracts were taken to dryness and the residues weighed, dissolved in *n*-hexane and vitamin A_1 esters and alcohol[2,3] and vitamin A_1 aldehyde[1] determined. The diethyl ether extract contained 75–80 per cent of the total lipids, 95 per cent of the total free and esterified vitamin A_1, but no vitamin A_1 aldehyde (qualitative test by reduction to the alcohol form). The light petroleum extract contained 20–25 per cent of the total lipid, 5 per cent or less of the total free and esterified vitamin A_1 and all the vitamin A_1 aldehyde, in amounts of about 20 μgm./egg. This aldehyde was identified by its chromatographic behaviour, by its characteristic absorption maxima in the ultra-violet and in the Carr–Price test, and by formation of vitamin A_1 alcohol under the action of sodium borohydride. No vitamin A_2 aldehyde was detected.

Table 1. MEAN VALUES FOR WEIGHTS OF WHOLE EGG AND OF YOLK AND FOR TOTAL AMOUNTS OF VITAMIN A_1 ESTERS, ALCOHOL AND ALDEHYDE IN EGGS FROM TWO LIGHT SUSSEX HENS

Bird	No. of eggs	Weight of whole egg (gm.)	Weight of yolk (gm.)	Vitamin A_1 esters* (μgm.)	Vitamin A_1 alcohol (μgm.)	Vitamin A_1 aldehyde (μgm.)
A	4	60 1	19·5	17·7	90	21·8
B	3	59·2	19 1	19·8	109	22·4

* Expressed as the equivalent quantity of vitamin A_1 alcohol.

No vitamin A in any form was found in egg white, which contains a negligible quantity of lipid, so that measurements on the yolk apply to the whole egg. Table 1 shows that, as has been previously reported[4], vitamin A_1 alcohol is the predominant form in hen's eggs, and that vitamin A_1 esters and vitamin A_1 aldehyde are present in about equal amounts.

Effect of Diphenylamine on the Synthesis of Carotene

A NUMBER of authors have shown that diphenylamine inhibits the synthesis of carotenoids mainly by micro-organisms[1–4]. We have carried out investigations with a red yeast rich in carotenoids in order to interpret the mechanism of this inhibition.

In 1953, Gyorgy Németh isolated from root nodules of *Lupinus luteus* certain micro-organisms which produced in a *Rhizobium* nutrient a red pigment and which were capable of fixing atmospheric nitrogen[5–7].

We used the same type of yeast. The micro-organism was allowed to multiply in Roux flasks in the form of a surface culture. The nutrient contained 5 per cent bean extract, and to it was added 5 and 20 mgm. of diphenylamine, respectively, in 100 ml.

On the agar nutrient containing 5 mgm. of diphenylamine, the content of carotenoids of the micro-organism essentially decreased and the red colour faded. On raising the concentration of diphenylamine to 20 mgm., the culture became completely colourless. Moreover, the quantity and nature of the carotenoids produced changes. In the presence of 5 mgm. of diphenylamine the content of carotenoids was 110 μgm. in 10 gm. of culture, and in the presence of 20 mgm. of diphenylamine it was 40 μgm. as compared with 285 μgm. in control cultures[8].

Control cultures free of diphenylamine contained torulin, γ- and β-carotene, and torularhodin. Of these compounds, torulin was present in the greatest quantity. On applying 5 mgm. of diphenylamine, the concentrations of carotenoids decreased by a similar extent, while in the presence of 20 mgm. of diphenylamine, neither torularhodin, the sole hypophasic pigment, nor γ-carotene could be detected. Accordingly, on evaluating the data of distribution between solvents, of chromatograms and of spectra[9], it can be stated that higher concentrations of diphenylamine inhibit the synthesis of the hypophasic pigment torularhodin and of γ-carotene, both of which belong, from a genetical aspect, to the group of 'younger' carotenoids. Obviously also the synthesis of other carotenoids is simultaneously reduced to a similar extent.

Interaction between Albumin, Lecithin and Cephalin

LECITHINS and cephalins form more or less stable combinations with proteins[1,2]. These are believed to be the result of lipid–protein interaction[3]. Provided the method is applicable, information regarding the interaction may be obtained by an electrophoretic method[4] used for the study of interaction between dextrans and proteins. Essentially, this method uses the Antweiler micro-Tiselius apparatus to obtain spikes, at various *p*H's and concentrations, of the two interacting substances and of their mixtures. Plotting the areas under the spikes against concentration enables one to determine a function of α, the specific refractive increment, and sometimes to decide as to whether the mixture of the two components has resulted in interaction between them.

In the case of albumin (Cohn's fraction V) and lecithin dissolved in alcohol or cephalin dissolved in wet ether, the protein undergoes a change (possibly denaturation) at 20° C., the temperature used for electrophoresis. This factor must be dealt with first.

1*a*. *'Denaturation' of albumin by alcohol at* 20° *C.* To 2 ml. of 4 per cent albumin dissolved in Michaelis buffer at *p*H 6·6 is added 1 ml. of the buffer and 1 ml. of 25 per cent, 15 per cent, and 5 per cent ethanol; after standing at 20° C. for 4 hr., the three systems are dialysed against Michaelis buffer at *p*H 6·6 for 8 hr. at 20° C. Electrophoretic patterns are obtained for each system, ascending migration being allowed to occur for 6 min. The areas under the spikes are measured and compared with the area under the spike (6 min. ascending migration) of a 2 per cent albumin in buffer at *p*H 6·6. For example, the area under the albumin spike was 86 arbitrary units, that under the spike for albumin plus 25 per cent ethanol 56 units, that under the spike for albumin plus 15 per cent ethanol 60 units, and that under the spike for albumin plus 5 per cent ethanol 70 units. Increasing concentration of ethanol reduces the area under the albumin–ethanol spike; the important reduction is that produced by 25 per cent ethanol, which is from 86 to 56 units. Call 56/86 = 0·65 or the factor *F*.

1*b*. *Effect of ether on albumin at* 20° *C.* Proceeding in exactly the same way as the above, at *p*H 6·6, and comparing the area under a 2 per cent albumin spike with the area under a 2 per cent albumin spike in a system containing 6·65 per cent of ethyl ether (nearly the highest concentration of ether miscible with water), the effect of the ether is slightly to increase the area under the albumin spike, *F* being 1·12. This small effect (10 per cent increase) may indicate an effect of ether on albumin, but not one like that produced by ethanol. There is no reason for thinking that what may be a 'denaturation effect' should not decrease the spike area in the case of ethanol, and increase it in the case of ether.

2*a*. *Interaction of albumin with lecithin.* The system contains 2 ml. of 4 per cent albumin in buffer at *p*H 6·6, 1 ml. of the buffer, and 1 ml. of Polanyi's lecithin (that is, about 25 mgm.) in absolute ethanol (Polanyi, M., private communication); the mixing of these components reduces the protein to 2 per cent, and the ethanol to 25 per cent. After standing for 4 hr. at 20° C., the mixture is dialysed against Michaelis buffer at *p*H 6·6 for 8 hr. at 20° C. The electrophoretic pattern now shows a spike moving at about the same rate as albumin moves; dialysed lecithin gives no electrophoretic spike. At 6 min. the area under the spike observed was 64 units, but this figure must be divided by *F* = 0·65 to allow for the 'denaturing effect' of 25 per cent ethanol. The division gives 98·5 units instead of 86 units for albumin alone. A reasonable explanation of this is that there has been an albumin–lecithin interaction, a new species having been formed which increases the area under the albumin–lecithin spike from 86 units (for the albumin alone) to 98·5 units for the new species, that is, an increase of about 15 per cent. Other experiments show increases of 14–20 per cent. The refractive index increment for the albumin is 0·0018, so that for the new species would be about 0 00204, assuming that the concentration of the new species is exactly the same as that of the albumin.

2*b*. *Effect of cephalin in ether on albumin at* 20° *C.* Using a system containing 2 ml. of 4 per cent albumin, 1·75 ml. of Michaelis buffer at *p*H 6·6 and 0·25 ml. of saturated cephalin in ether, electrophoretic patterns were obtained for 2 per cent albumin and for the mixture containing 2 per cent albumin plus cephalin in ether. Comparing the areas under the spikes, the incorporation of cephalin in ether produced substantially the same effect as that of ether alone, that is, an increase under the spike of about 10 per cent. Considering the interaction produced with albumin by lecithin in 25 per cent alcohol, the absence of an effect of cephalin in ether may seem surprising, but it has to be remembered that solubility determines that the quantity of cephalin in the protein–cephalin–ether systems is only 2·5 mgm., while the amount of lecithin in the protein–lecithin–ethanol systems is about 25 mgm. The latter gave a 15 per cent increase in spike area by interaction; the former, if the effect were proportional to weight, would give only a 1·5 per cent increase, which could be missed.

Finally, if washed red cells are added to the dialysed protein–lecithin–ethanol system, examination between plastic surfaces shows that they are spheres, that is, there is enough lecithin in the system to sphere them in spite of the albumin. If washed red cells are added to the dialysed protein–cephalin–ether system, they remain crenated disks, presumably because the concentration of cephalin is too small to render them spherical.

This work was done under a grant, No. *H*-1598, from the U.S. Public Health Service, and Contract No. *DA*-49-007-*MD*-458 from the Department of the Army.

We are grateful to Dr. D. G. Dervichian for his advice and suggestions.

Smilagenone and *Epi*-Smilagenin from *Dioscorea* Saponin

In examining the effect of prolonged keeping of *Dioscorea* yams[1] in contact with water, fresh yams of *Dioscorea prazeri* and *D. deltoidea*, after being cut to small pieces and crushed, were mixed with sufficient water for different periods ranging from a few weeks to several months. The filtered residue was dried and extracted with petroleum ether (b.p. 40–60°) in a Soxhlet.

From the petroleum ether extract a colourless crystalline product was obtained. On chromatography over alumina it yielded mainly the following products: (*A*) $C_{27}H_{42}O_3$, stout needles, m.p. 188–89°; $[\alpha]_D^{21}$ − 52° ($CHCl_3$) and (*B*) $C_{27}H_{44}O_3$, fine silky needles, m.p. 220–22°; $[\alpha]_D^{21}$ −43·8° ($CHCl_3$). Product *A* failed to give any acetyl derivative, but formed a semicarbazone, $C_{28}H_{45}O_3N_3$, m.p. 222–23° (decomp.). On catalytic hydrogenation in acetic acid it yielded product (*B*), which again on oxidation with chromic acid gave back product (*A*). Product (*B*) formed a monoacetate, $C_{29}H_{46}O_4$, m.p.

163–64°, and was identified as *epi*-smilagenin by a comparison of the mixed melting point with an authentic specimen. Product (*A*) was similarly identified as smilagenone.

In this connexion it may be mentioned that Marker *et al.*[2] showed that dehydrotigogenone (diosgenone) when administered to a dog on biscuit diet gave diosgenin, smilagenin and *epi*-smilagenin.

The work was financed by the Council of Scientific and Industrial Research, New Delhi. Thanks are due to Dr. A. Sandoval, director of the Instituto de Quimica, Mexico, and Prof. C. Djerassi, Wayne State University, for authentic specimens.

Thiobarbituric Acid Spray Reagent for Deoxy Sugars and Sialic Acids

RECENTLY, new sensitive assays have been reported for deoxy sugars[1], 2-keto,3-deoxy sugar acids[2–4], and sialic acids[5,6]. In these assays, the products of periodate oxidation, malonaldehyde from deoxy sugars and β-formylpyruvic acid from the latter two groups of compounds, are coupled with 2-thiobarbituric acid to produce a bright red chromophore. I wish to report an adaptation of these methods for spraying paper chromatograms.

The procedure for the detection of deoxy sugars and 2-keto,3-deoxygluconic acid is as follows. After removal of solvent the paper is sprayed with a 0·02 *M* aqueous solution of sodium periodate. After 15 min. a solution consisting of ethylene glycol, acetone and concentrated sulphuric acid (50 : 50 : 0·3) is sprayed on to the paper. After 10 min. the paper is sprayed with an aqueous solution of 6 per cent sodium 2-thiobarbiturate. (Although several chemical supply companies sell '2-thiobarbituric acid', we have found that the product is frequently mislabelled and that the product is a salt of 2-thiobarbituric acid. Only 0·9 gm. of the acid is soluble in 100 ml. water, whereas 6·5 gm. of the sodium salt is soluble in the same amount of water. The free acid may be rendered soluble by the addition of an equimolar amount of sodium hydroxide.) Red spots appear after heating at 100° for 5 min. Under an ultra-violet light ('Mineralight') the spots give a red fluorescence. As little as 0·5 μgm. of 2-deoxyribose can be seen. We have used the spray to detect 2-deoxyglucose, 2-deoxyxylose, and 2-deoxygalactose. Although 3-deoxyglucose can also be detected on paper, the colour intensity of the spot is considerably less than that of an equimolar amount of 2-deoxyglucose.

For the detection of sialic acids a solution of 0·05 *M* sodium periodate in 0·05 *N* sulphuric acid is used. The glycol and thiobarbituric acid solutions are the same as above. A longer heating time of about 10 min. is required. Approximately 3 μgm. of sialic acids can be detected.

Using this procedure, deoxy sugars and sialic acids have been successfully located on Whatman No. 1, 3 and 3 *MM* paper, using a variety of acidic, basic and neutral solvent systems.

Enzymatic Deamination of 5-Deoxycytidylic Acid and of 5-Methyl-5′-deoxycytidylic Acid in Growing and in Non-growing Tissues

THE deamination by enzymatic hydrolysis of 5′-deoxycytidylic acid to 5′-deoxyuridylic acid and of CH_3-5′-deoxycytidylic acid to 5′-deoxythymidylic acid has been previously reported in sea urchin egg homogenates[1,2], and in adult rabbit liver[3].

The deamination of 5′-deoxycytidylic acid and of CH_3-5′-deoxycytidylic acid has been investigated in the developing sea urchin embryo[4], in normal and regenerating rabbit liver, in adult rats and in embryonic rat tissues, in adult chick and in chick embryos in order to correlate these enzyme activities with biosynthesis of deoxyribonucleic acid and hence with the metabolic activities of tissues that grow by increase in the number of the component cells.

In this preliminary communication some of our results for tissues of warm-blooded animals are reported. These clearly show that the 5′-deoxycytidylic acid and the CH_3-5′-deoxycytidylic acid deaminations occur to a greater extent in growing tissues than in normal non-growing tissues. In adult tissues of rat and of chick it is impossible to detect with our assay the activities in the unfractionated homogenate.

The tissues, as soon as they were removed from the animal, were homogenized in a Potter–Elvehjem glass homogenizer with phosphate buffer. The homogenate was centrifuged for 15 min. at 4° C. and at 18,000*g*. The supernatant was used for the enzymatic assay.

The enzymatic assays are based on the ultra-violet spectral variations caused by the deamination. Tables 1 and 2 show the assays. All the enzymatic determinations have been made in the range in which

Table 1. ASSAY OF 5′-DEOXYCYTIDYLIC ACID DEAMINASE

Time (min.)	Absorbance at 232 mμ	250 mμ	267 mμ	280 mμ
0·5	0·120	0·175	0·440	0·530
6	0·120	0·195	0·445	0·495
11	0·115	0·215	0·440	0·450
Δ*A*	−0·005	+0·040	0	−0·080

Centrifuged supernatant of a homogenate from chick embryo's liver: protein, 2 mgm.; 5′-deoxycytidylic acid, 1 μmole; *tris*, 30 μmoles. Final volume, 0·5 ml.; *p*H 7·2. Incubation at 38° C. At the indicated times 0·1 ml. was removed and 0·1 ml. 10 per cent perchloric acid was added. After high-speed centrifugation 0·1 ml. of the clear colourless supernatant was diluted with 2·4 ml. of 0·01 *N* hydrochloric acid, and the absorbance of this solution was determined with a Beckman *DU* spectrophotometer.

Table 2. ASSAY OF CH_3-5′-DEOXYCYTIDYLIC ACID DEAMINASE

Time (min)	Absorbance at : 236 mμ	260 mμ	273 mμ	290 mμ
0 5	0 175	0 345	0 545	0 560
6	0 175	0 360	0 540	0 525
11	0·170	0 375	0 545	0 490
ΔA	−0·005	+0 030	0	−0 070

The conditions were those of Table 1, except for the substitution of 5′-deoxycytidylic acid by 1 μmole of CH_3-5′-deoxycytidylic acid.

Table 3. RELATIVE SPECIFIC ACTIVITIES OF 5′-DEOXYCYTIDYLICASE AND CH_3-5′-DEOXYCYTIDYLICASE IN RESTING AND GROWING TISSUES

Animal	5′-Deoxycytidylicase	CH_3-5′-Deoxycytidylicase
Chick embryos' liver	40	35
Adult chick liver	0	0
Rat embryos without liver	34	29
Rat embryos' liver	30	18
Adult rat liver	0	0
Adult rabbit liver	17	13
Adult rabbit liver in regeneration after partial hepatectomy	28	24

The conditions of the assays were those of Tables 1 and 2. The specific activities of the two enzymes are measured respectively as ΔA 280 mμ and ΔA 290 mμ, multiplied by 10^3 per 10 min per mgm. of protein.

there is direct proportionality of the spectral variations with the amount of enzyme used.

When, instead of the deoxynucleotides, the corresponding deoxynucleosides or bases are used as substrates in the conditions of our assay, the absence of spectral variations in embryonic tissues of chick and of rat, and the absence of significant spectral variations in rabbit liver, indicate that the direct deamination of 5′-deoxycytidylic acid and of CH_3-5′-deoxycytidylic acid is being measured.

Furthermore, in every case 5′-deoxyuridylic acid and 5′-deoxythymidylic acid have been isolated in good yield from incubation mixtures containing ten times the amounts indicated in Tables 1 and 2. The techniques used for the isolation have been described in refs. 1 and 2.

The results presented in this communication, and other results on the behaviour of 5′-deoxycytidylic acid and CH_3-5′-deoxycytidylic acid deamination in the developing sea urchin embryo[4], emphasize the importance of these enzyme activities in biosynthesis of deoxyribonucleic acid and in cellular multiplication.

These results will be reported in detail elsewhere.

This investigation was supported by research grant No. C-3401 from the National Cancer Institute, U.S. Public Health Service.

A Methyl Cytidine from the Ribonucleic Acid of *Anacystis nidulans*

A PROJECT was undertaken to characterize the nucleic acids from *Anacystis nidulans*, a blue-green alga. The present communication deals with the characteristics of ribonucleic acid and a new cytidine compound from it.

Freshly harvested cells grown in a continuous culture chamber[1] were used for isolating ribonucleic acid from *Anacystis nidulans*. It was found that the method of Ogur and Rosen[2] was most suitable. Ribonucleic acid constitutes 0·37–0·50 per cent of the fresh weight of the cells. Ribonucleic acid thus isolated was purified from protein with octanol–chloroform mixture and from polysaccharides with 2-methoxy ethanol[3]. The percentage of moles of different bases and nucleotides were estimated by ascending paper chromatography[4] and electrophoresis[5]. These results, together with nitrogen and phosphorus ratio, are given in Table 1. Ribonucleic acid records a maximum absorption at 260 mμ and minimum at 230 mμ. It shows a preponderance of guanylic acid compared to other nucleotides.

Table 1. PERCENTAGE OF MOLES OF NUCLEOTIDES IN RIBONUCLEIC ACID

Extraction	N (per cent)	P (per cent)	N/P	Max. (mμ)	Min. (mμ)	GA	AA	CA	UA
						Mole (per cent)			
10 per cent NaCl*	14 80	6·45	2 3	260	230	36	25	20	19
$HClO_4$	15·57	8 25	1·89	260	230	39	22	20	19

* Extraction of ribonucleic acid with 10 per cent sodium chloride was done according to the procedure of Heinrich *et al.* (ref. 8)

After hydrolysing ribonucleic acid with hydrochloric acid for 1 hr. at 100° C. the cytidylic acid was recovered from the paper chromatogram[4]. The cytidylic acid thus isolated was incubated with alkaline phosphatase (purchased from Nutritional Biochemicals Corporation, Cleveland, Ohio) in 0·2 *M tris* buffer at *p*H 9·0. After standing for 4 hr. at room temperature the incubated mixture was chromatographed[4]. It was observed that cytidylic acid was fully converted to cytidine within that time when the concentration of enzyme was 8–10 per cent of the substrate weight. The cytidine was further subjected to electrophoresis in borate buffer *p*H 9·2 for 6 hr. at a voltage gradient of 11 V./cm. The cytidine was resolved into two spots and the mobilities of those compounds are recorded in Table 2. The spots were eluted with 0·1 *N* hydrochloric acid and the spectra were taken on a recording Cary spectrophotometer. The spectral characteristics of the new compound, which resembles mostly cytidine, is given in Fig. 1. The sugar moiety of cytidine compound was further analysed after hydrolysis with 0·05 *N* sulphuric acid and the characteristic mobility of the sugar in borate buffer is given in Table 2. From the characteristics of the sugar moiety, cytidine from *Anacystis nidulans* contains 2-O-methyl ribose. The optical density at 280 mμ of methyl cytidine varies from 0·2 to 0·25 per cent of the total optical density at 280 mμ. Methyl ribosides of purines and pyrimidines have recently

Table 2. ELECTROPHORETIC MOBILITY OF CYTIDINE COMPOUNDS AND PENTOSES

Substances	Mobility	Substances	Mobility
Deoxycytidine	0·61	Sugar from *X*-cytidine	0·57
X-cytidine (unknown)	0·72	2-O-methyl ribose	0 60
Cytidine	1·00	3-O-methyl ribose	0 83
Deoxyribose	0·48	Ribose	1·00

Electrophoresis was carried out in borate buffer *p*H 9·2 for 6 hr., voltage gradient being 11 V./cm. The movements of the compounds are towards anode.

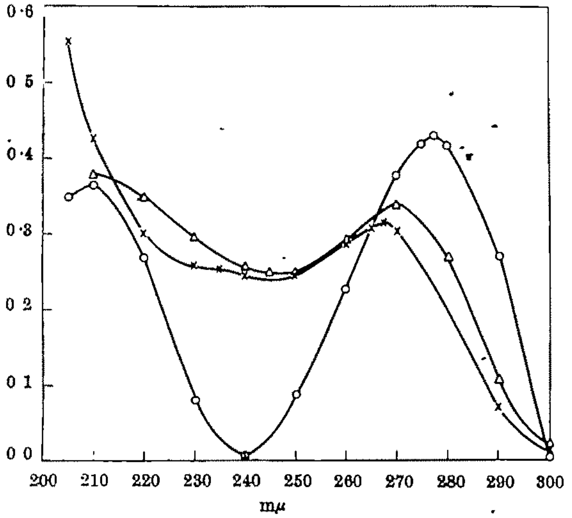

Fig. 1. Ultra-violet absorption spectrum of *X*-cytidine from ribonucleic acid. ○, *p*H 2·0; ×, *p*H 7·2; △, *p*H 11·5

been reported in some ribonucleic acid by Smith and Dunn[6]. (Methylated trityl adenosine was generously supplied by Dr. J. D. Smith from which 2-O-methyl and 3-O-methyl ribose were separated according to Brown *et al.*[7].) Other methyl ribosides were not detected in our preparations.

The precise role of this type of cytidine or other nucleosides or nucleotides in any type of ribonucleic acid is unknown. However, it may not be out of order to speculate upon their involvement in specific protein synthesis.

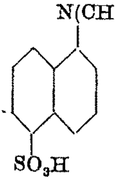
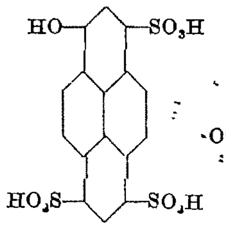
Depolarization of the Fluorescence of Proteins labelled with Various Fluorescent Dyes

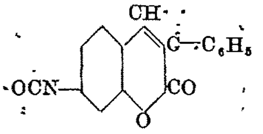
The technique by which measurements of the depolarization of fluorescence of protein conjugates is used for investigating rotational relaxation has been applied mainly with the fluorescent dye, 1-dimethylamino-naphthalene-5-sulphonic acid (I)[1,2]. The life-time of the excited state (τ) of this dye when conjugated to protein has been measured by independent methods by Weber[3] and by Steiner and McAlister[4]. Good agreement was reported, and in the present work the value $\tau = 1{\cdot}18 \times 10^{-8}$ sec. (probably accurate to $\pm 0{\cdot}05 \times 10^{-8}$), the mean of several determinations on conjugates with bovine serum albumin by Steiner and McAlister, has been assumed throughout. Assuming an absolute error in the experimental estimates of degree of polarization (*p*) of ± 0·003, it can be shown that the dye (with $p_0 = 0{\cdot}25$, the subscript referring to zero value of the temperature/viscosity ratio) is adequate for measuring relaxation times in the range $0{\cdot}5$–30×10^{-8} sec. to an accuracy of ± 10 per cent. These relaxation times correspond to a molecular weight range of 5,000–300,000 if the molecule is spherical and unhydrated. The corresponding molecular weights for hydrated and moderately asymmetric molecules will be less, usually by a factor of at least 2 or 3. The range is determined mainly by the magnitude of τ and the accuracy of measurements of the degree of polarization of the fluorescent light. If dyes having longer and shorter values of τ were available, the range of the method would be considerably extended.



I



II



III

The present communication describes the use of two such dyes: 3-hydroxypyrene-5:8:10 trisulphonic acid (II) with a longer life-time, and 3-phenyl-7-*iso*cyanato-coumarin (III) with a shorter life-time. Both dyes conjugate easily with proteins[5,6]. Such conjugates with bovine serum albumin have been prepared, and the τ values in each conjugate determined by Weber's method[3]. The degree of polarization of fluorescence of the conjugate was measured through a yellow filter (Ilford 110) over a range of temperature. Plotting the reciprocal of the degree of polarization of fluorescence as a function of the temperature/viscosity ratio, it was possible to calculate the τ values using Perrin's modified equation[8] and assuming Oncley's values for the principal relaxation time of bovine serum albumin[7]. From these results the range of relaxation times (ρ) measurable to ± 10 per cent with each type of conjugate has been calculated together with the corresponding range of anhydrous spherical molecular weights; these results are shown in Table 1. It can be seen that the pyrene derivative has a life-time some eight times greater, and the coumarin derivative almost five times smaller than the naphthalene compound. The range of relaxation time (and molecular weight) which can be investigated by this technique is correspondingly extended.

The total range of molecular weights covered by conjugates prepared from these three dyes is 1,000–2,500,000 for spherical unhydrated molecules, or

Table 1. Range of the Depolarization Method

Dye	$\tau \times 10^{-8}$ sec	Range of relaxation times × 10^{8}	Molec. weight range × 10^{-3} (spherical molecules)
3-Hydroxypyrene 5:8:10 trisulphonic acid	9·0	4–250	40–2,500
1-Dimethylamino-naphthalene 5-sulphonic acid	1·18	0·5–30	5–300
3-Phenyl-7-*iso*-cyanato-coumarin	0·25	0·1–7	1–60

about 400–1,000,000 for typical, moderately asymmetrical molecules. Experiments have already shown the usefulness of the newer dyes with certain protein molecules which are either too large or too small for investigation with the naphthalene dye[8], but it would be rash to expect that all such cases would be successful. The occurrence of protein inactivation, of specific protein effects on the fluorescent life-time, the onset of intramolecular rotations, and similar effects are largely unpredictable and must be excluded before a useful application in any one case can be proved.

ANIMAL PHYSIOLOGY

Urinary Phenols in Stress

ABNORMALLY high rates of excretion of 4-hydroxy-3-methoxymandelic acid, a metabolite of both adrenaline and noradrenaline, are now well known to be associated with phaeochromocytoma and sympathoblastoma[1–3]. A convenient chromatographic technique enabling the substance to be estimated visually has been described elsewhere[3]. It seemed of interest to examine the possibility that the method would prove sufficiently sensitive to detect the increased secretions of the catecholamines to be anticipated in subjects exposed to stress.

In the first place we have examined urines from hospital patients under severe conditions of stress occasioned by spinal shock, surgical operations, accident injuries and burns. In contrast to young normal males who excreted 4-hydroxy-3-methoxymandelic acid at average rates varying from 1 to 2·5 μgm./min. (values not corrected for incomplete recovery from urine), many of these subjects excreted the acid in much greater quantity (4–10 μgm./min.). The behaviour of patients having complete transverse lesions of the cervical cord has proved of particular interest, since in these subjects the whole efferent sympathetic outflow is isolated from the control of the higher nervous centres. The excretion-rate of 4-hydroxy-3-methoxymandelic acid was observed to be markedly subnormal in fit subjects of this type, but was within the normal range in those under conditions of stress; this increase in stress may possibly be due to adrenaline release by a direct action of histamine on the adrenal medulla.

More detailed chromatography has indicated that other phenols may be excreted in increased amounts in stress. The most noticeable changes in the present experiments occurred with *p*-hydroxyphenyllactic acid; in spinal shock at least, the appearance of this substance is probably related to the difficulty of saturating the patients with ascorbic acid. Increased excretion of *p*-hydroxy-phenylpyruvic acid also occurred in some subjects. Increases in the excretion of homovanillic acid in stress were rather less well defined owing to the invariable presence of this acid in normal urine; however, several of the subjects excreted considerably more than the 8 mgm./24 hr. quoted as the upper limit of the normal range[4]. It seems possible that an increased metabolism of 3 : 4-dihydroxyphenylethylamine is implicated, and that this amine might play some part in the response of the human subject to stress. The two urines from cases of neuroblastoma examined by Sandler and Ruthven[2], to whom we are grateful for samples, have been examined chromatographically and both were found to contain large amounts of homovanillic acid in addition to 4-hydroxy-3-methoxymandelic acid; abnormal excretion of homovanillic acid was not noted in eight cases of phaeochromocytoma, however. A further example where excretion was high occurred in the one case of argentaffinoma examined.

One of us (P. S.) wishes to thank the Director-General of Medical Services, Royal Air Force, for permission to publish this work and Cpl. Tech. McKim for experimental assistance.

Release of Acetylcholine in Rat Diaphragm

SEVERAL attempts have been made in the past to correlate the amount of acetylcholine released during activity at nerve endings with the amount needed to produce activation of the effector cell[1-3]. It is clearly of crucial importance for the acetylcholine hypothesis that there should be quantitative agreement between these amounts. Until recently, a very substantial discrepancy has remained, supporting the suggestion that acetylcholine is merely a by-product of transmission. One source of difficulty in making such correlations has been the paucity of results concerning the release of acetylcholine and the excitation produced by its application in the same preparation.

Intracellular recording of end-plate activity in muscle, and the ionophoretic application of acetylcholine in controlled amounts from micro-pipettes, have made possible a detailed analysis of end-plate potentials under conditions closely approaching those which obtain during normal transmission at the neuro-muscular junction. End-plate potentials have been produced by such methods in the isolated rat diaphragm with as little as $1 \cdot 5 \times 10^{-17}$ mole of acetylcholine[4]. We have now found that acetylcholine is released by nerve endings in the rat diaphragm, during stimulation of the phrenic nerve, in amounts which are of the same order of magnitude.

The isolated phrenic nerve diaphragm preparation was stimulated in a 'Perspex' chamber at room temperature (19–23° C.). The muscle was bathed in 5·0 ml. of Ringer–Locke solution continually agitated by oxygen bubbles, and the rate and duration of nerve stimulation were kept to a minimum consistent with the sensitivity of the preparation used for assay (the leech dorsal muscle, the heart of *Mya areneria* or the rat duodenum). To prevent destruction of acetylcholine, we either added physostigmine sulphate to the solution (10^{-5}), or administered di*iso*propyl fluorophosphonate to the rat (1 mgm./100 gm. body-weight). For control, active solutions were treated with strong alkali whenever possible.

It is difficult to be certain in this type of experiment that one is exciting all the nerve endings. The phrenic nerve was always stimulated with shocks two or three times greater than maximal, and the action potential of the nerve trunk was recorded close to its entrance into the muscle throughout the period of stimulation. This gave us a useful index of failure of excitation or conduction in the nerve, but no positive information about the activation of the nerve endings.

During periods of stimulation at a rate not greater than 5/sec. and lasting not more than 5 min., the amounts of acetylcholine collected from hemi-diaphragms varied between 0·4 and $2 \cdot 5 \times 10^{-13}$ mole per impulse. Fourteen estimates gave a mean value of $1 \cdot 1 \times 10^{-13}$ mole. Since there are about 10,000 muscle fibres in the hemi-diaphragm[5], the mean release per ending was $1 \cdot 1 \times 10^{-17}$ mole.

It is clear that in the rat diaphragm there is overlap between the least amount of acetylcholine needed to produce appreciable excitation at an end-plate ($1 \cdot 5 \times 10^{-17}$ mole) and the greatest amount released at nerve endings during stimulation ($2 \cdot 5 \times 10^{-17}$ mole). The latter should be more significant than the mean value, since the principal sources of error, imperfect activation of nerve endings and hydrolysis of acetylcholine, would both lead to an under-estimate.

Effect of Supernatant Potassium-Level on Cardiac Activity in Quantitative Tissue Culture

INADEQUATE functional 'survival' of hearts cultured in supernatant containing serum with a high potassium-level from lysed red cells led us to investigate the effects of supernatant potassium-levels on the electrical activity of 1,222 hearts in quantitative tissue culture. The criterion for 'adequate survival' is an ability to produce potentials of at least 0·02 mV. during a minimum of three periods of observation per day (8 a.m., 1 p.m. and 5 p.m.). The apparatus, etc., is described in previous papers[1]. The supernatants are 0·25 per cent solutions of human serum protein in balanced salt solutions—however, they differ in potassium-level. The 'adequate survival' time is given to the nearest day using the smallest figure in cases of doubt.

Fig. 1*a* relates time and percentage adequate 'survival' for three separate series of 6-day chick embryo whole hearts, all from the same breeder.
